THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1875. NEW YORK, JANUARY 2, 1886. PRICE FIVE CENTS. $3.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Pomological.

A GRAND OLD APPLE TREE.

HERE we show, at Fig. 1, what is thought to be the largest apple tree in this country, if not in the world. It stands in the dooryard of Mr. Delos Hotchkiss, Marion, Conn. Its dimensions are truly gigantic.

The circumference, one foot from the ground, and above all enlargement of the roots, is 13 feet eight inches. The girth of the largest single limb is six feet eight inches. The top limbs reach a hight of 60 feet, and the spread of the limbs is 100 feet, or six rods.

Mr. Hotchkiss has known the tree for more than 70 years, having owned it 50 years. In a recent letter he says: "The old tree bore on alternate parts until 1876, when it bore all over and has continued to do so ever since. This year it was completely loaded with apples. It bears a medium-sized winter apple—a good keeper. The crops vary from 80 to 85 bushels one year to 30 or 40 the next." It must have produced thousands of bushels during its long life of 180 years. Of the eight large branches five bear one year and three next. There is something almost human about these noble old giants. The "old tree" has done its work well; has earned its fame, and we take pleasure in showing it to our readers. We are indebted to Hon. Marshall P. Wilder for its photograph.

TRUE STORY OF MEECH'S PROLIFIC QUINCE.

IN the RURAL of Nov. 7th, reference is made to the decision of the fruit judges at the Fair at Mt. Holly, N. J., to the effect that Meech's Prolific Quince is identical with the Champion. The truth, briefly told, is this: About 20 years ago, one Chauncy Paul came here and started a nursery, bringing with him cuttings from Springfield, Ohio, from which the quince now known as Meech's Prolific was propagated. About that time a Mr. Moore, of this place, obtained two trees of Mr. Paul, from which he has propagated perhaps a dozen others, which are now in full bearing. The Rev. W. W. Meech, some years after that time, observed the wonderful fruitfulness of this variety, and commenced the propagation of it, obtaining cuttings from Mr. Moore's trees, and from those of a half dozen other persons here, who have the quince in cultivation. In assuming the possibility that this and the Champion are identical, we encounter the following difficulties:

1st. The cuttings of Meech's Prolific Quince were brought here, and cut from old trees in Ohio 20 years ago, while the Champion is of recent origin, reaching back not much over ten years. [It is plainly *not* the Champion.—EDS.]

2d. The Champion, grown here upon the same ground as Meech's Prolific, is very subject to blight, and is a shy bearer; indeed, it is universally worthless here, while Meech's is vigorous, hardy, and the most profuse bearer of all quinces.

3d. Meech's assumed its beautiful golden hue on October 15, this year, while the Champion was quite green on November 1.

Whether the Rev. W. W. Meech was justified in affixing his name to a quince which was in general cultivation in Vineland, N. J., some years before his advent here, is a question, but in any view of the case, the wonderful merits of the quince will never be questioned by those who have seen it in fruit. JOHN WILLCOX.

Vineland, N. J.

MEECH'S QUINCE.

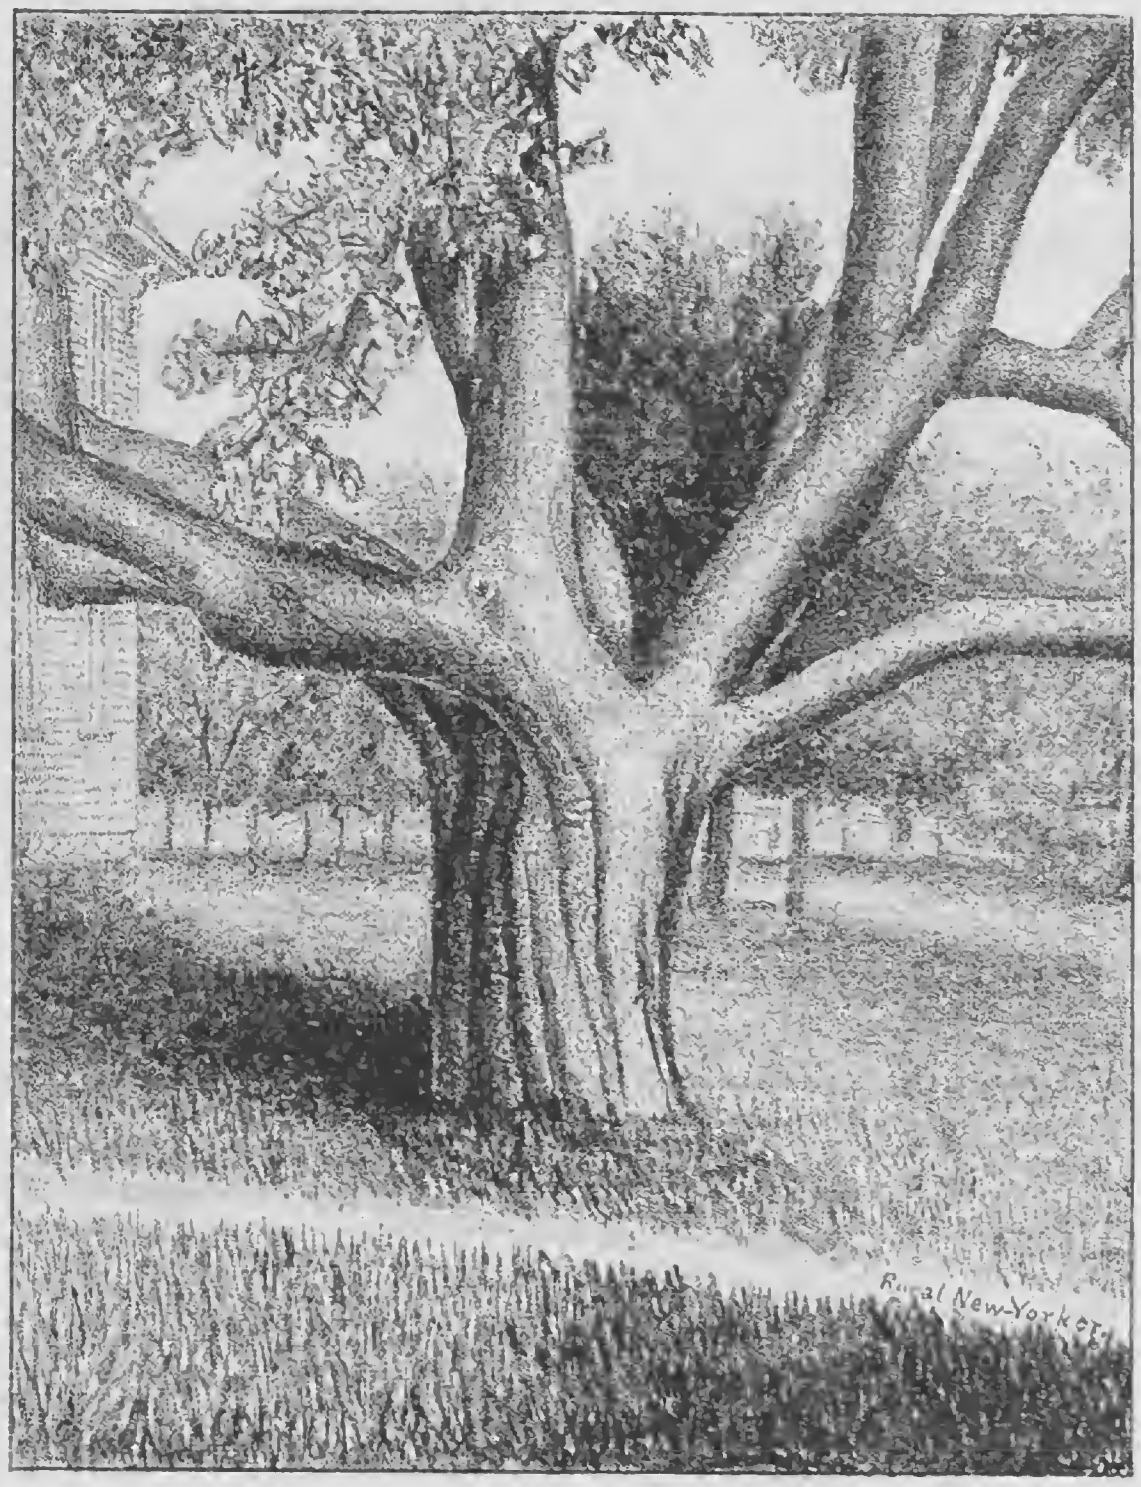
ALMOST everything in the shape of a quince that is not known to be Angers, or Champion is called Orange Quince. This race of Orange Quinces has sprung from numerous seedlings, and there are numerous types of it all over the country, that vary in shape, size, quality, and dates of ripening. I have given this matter the closest attention, and find in my travels that the Orange Quince is divided into many strains, coming from different sources. Quinces have sprung up in gardens, have been planted, propagated, and called Orange Quince, for the reason that they resembled that quince more closely than any other variety. In many cases these are not Orange Quinces, but seedlings that vary considerably. I do not doubt but that Meech's Quince is one of these variations of the Orange Quince, of an improved type. This idea is not original with me. There is a gentleman in Western New York, who has discovered a valuable strain of the Orange Quince, has propagated from it, and has secured what might be considered a new variety, and still, he cannot trace it to any source, as it has been under cultivation for many years under the name of Orange Quince. The shape referred to is round and entirely different from the common type of Orange Quince. The fruit is also larger, and less gritty, and of better quality. The fact is, that the quince has not received the attention it should have received, and is one of our neglected fruits. Mr. Downing told me that he had examined specimens of Meech's Quince and had no doubt that it was a new variety. While I have no positive information on the subject, I have reason for believing Meech's Quince to be an improved type of the Orange.

CHARLES A. GREEN.

THE NEW PEAR DR. REEDER.

OUR only specimen was purchased in the Spring of 1876, and it bears this year for the first time, quite abundantly. The tree in its growth, at its present age, resembles Clapp's Favorite. The variety originated in New York State, though with whom we do not know. The fruit is of medium size at its best, though always averaging larger than the Seckel. It is in shape much like the latter, roundish, pyriform—sometimes obovate. The skin is russeted on a yellow ground, and the flesh is sweet, tender, juicy with a peculiar musky, aromatic flavor. It began to ripen Oct. 25th.

The pear may never prove of the first value for market; but it is certainly one of the best of its season. The stem is slender and an inch and a quarter long, slightly sunk. The calyx is open in a shallow basin. Fig. 3 (page 3) shows an excellent portrait of the pear with a cross-section at Fig. 4.



A GRAND OLD APPLE TREE. From a photograph. Fig. 1.

RURALISMS

FLORISTS employ various devices for preserving cut flowers, the chief being refrigerators and ice chests. These, though somewhat expensive, answer the purpose in a satisfactory manner for preserving flowers on the premises. I am not aware, however, that any equally good method is in use for the preservation of flowers while in *transitu*; for example, in sending flowers from Boston to New York, or between any two given points, especially in warm weather. It has just at this moment occurred to me that I know of something that will probably answer this purpose. I am a devoted follower of good old Izaak Walton, and a member of the brotherhood of anglers. All of us who "go a-fishing" desire to bring our fish home in a fresh and sweet condition on a hot Summer's day; and this until lately, we have not been able to do without recourse to troublesome methods, the best of which are far from satisfactory. An inventive genius about a year ago offered the angling fraternity a basket which answers the purpose in an acceptable manner. We put our lunch, etc., in it when we go out, and bring our fish home fresh when we return.

* * *

This basket, though light and easily carried, is made upon the principle of an ice chest, and it has seemed to me that it would be an excellent thing for the transportation of delicate flowers, and also for keeping them at home in a small way. It is, at all events, worthy of examination by those interested in the preservation and transportation of flowers. The basket is now made in three sizes, to suit the angler, but could be made of any size. It can probably be seen at the principal fishing tackle dealers in most of our large cities. It is called a "refrigerator basket."

* * *

Fish-culture, in the not distant future, will, no doubt, occupy the attention of a good many farmers favorably located for the purpose. Some have already made a beginning, but not always wisely. I think I can see the time when leading agricultural papers will have a column headed "Fish-culture."

* * *

I have lately neglected to say anything about our native trees and shrubs, though I have been among them all the time. There are plenty of good ones left. I would just now mention Prunus maritima as being worthy of a place on the lawn, where I have more than once placed it. Its common name is Beach Plum, so called because it is usually found on the beach. It is common along the seashore, where it grows in the sand, and reaches a hight of from three to six feet. Its exposure subjects it to many casualties, and in consequence it often presents anything but a symmetrical appearance; yet I have seen not a few specimens, especially on the south beach of Staten Island, that were all that could be desired in this respect. At all events, I know you can make it pretty much what you please under cultivation. It flowers in May, and is quite as handsome, at that time, as many of our best spiræas. The flowers are white, and appear in umbels, which almost cover the plant under favorable conditions. The fruit is small, nearly round, and of a purple color. It is sometimes eaten. Begin with a small plant, not more than twelve to eighteen inches high, and you can then make it either a shrub or a dwarf tree, to suit your taste, with comparatively little trouble. It is a plant peculiarly adapted for sandy soils, and yet will

not object to one with some body and richness.

* * *

The Editor very properly advises a correspondent to use lime on his muck. I do not know whether he has any preference, but I always use shell lime in preference to stone lime, if I can get it. Stone lime sometimes contains a sufficient quantity of magnesia to be hurtful; but as this is not often the case, nobody should be deterred from using stone lime when the other can not be had. Still, I think shell lime is always to be preferred for agricultural purposes. I am about to use it largely on muck, as I have many times before.

* * *

The Editor advises the ladies to go slow in silk business. This is sound advice in two directions. The ladies do not seem to remember that raising silk worms is a matter that has already been thoroughly tried in this country, and in every instance (except in California) with disastrous failure. Even the Cheney Brothers, the largest and oldest silk manufacturers in the country, have tried it and given it up, as did their fathers before them. Mr. Van Nest and many others tried it years ago largely and systematically, and grew poor on the results. It is well, too, to remember the multicaulis fever, which made so many sick unto death (financially).

* * *

A good many years ago I was present when Mr. Rush Cheney was trying to get some native cocoons into condition for reeling. Having failed in many ways, he tried boiling in a strong lye: but still the silk would only come away in short pieces, which were injured in the fiber and made useless. The glue in those cocoons beat Russian glue out of sight. There is none of this trouble with cocoons imported from China, Japan, Italy, or even California. There are several reasons why raising silk worms can not be profitably pursued in this country, at least at the North. I have raised cocoons in a small way for amusement, and there is something very interesting and even fascinating about it; but inasmuch as everybody thus far has failed to make it profitable, it is not too much to ask the ladies, in the kindliest manner, to ponder the subject seriously before going into silk-raising as a business for profit. I really wish the field were entirely open to them; but, other obstacles removed, they can not hope to compete successfully with foreign cheap labor. HORTICOLA.

Sheep Husbandry.

Notes from the Rural's W. N. Y. Farm

FEEDING LAMBS.

SORTING THE LAMBS,

when putting them into winter-quarters, is an important operation that should by no means be neglected, nor should it be very long delayed. It would be folly to put them up promiscuously, the weak with the strong, or the smaller young ones with those older and larger. When in good health, there is nothing more impatient, at feeding time, than a lot of lambs, and if the younger be with the older or the weak with the stronger, they will be overrun and crowded away from the trough, and if a large number be together the feeder must be active, and look out well, or he will be taken off his feet in the rush they will make to get at the trough first.

Anywhere from 18 to 25 will do in a pen, the number depending upon its size; but we have found about 20 the best number, and they should be selected "all of a size," and as they must be seen several times daily, for several months, and as every owner will take better care of anything in which he takes a pride, and as they will look so much better, we recommend selecting those of about the same grade of wool for each pen, and if some have black faces and others not, by all means put the black faces by themselves and the same with the white. Very soon after penning, the lambs become accustomed to each other, familiar as it were, and feed quietly together. It is therefore best that they be sorted and bunched, as they are to be fed, as soon as possible after being placed in the barns, and after being so placed there should be as little changing from pen to pen as possible, and absolutely none except in case of sickness or where one for any reason fails to thrive, in which case it should be removed at once.

THE LAMBS SHOULD BE SHORN

as soon as they have become thoroughly familiar with their quarters, and accustomed to the change of food. If we fairly demonstrated the necessity of shearing in the case of ewes for winter lamb-raising, every reason then given, is greatly intensified in the case of the lambs, and that it will pay, and pay largely, we have demonstrated by six years' experience, with never a failure. A good lamb carries a fleece of from five to eight pounds of wool, and, as we have shown in the case of the ewes, to get the largest growth for the feed consumed, they must be kept in a uniform temperature of from 55 degrees to 65 degrees, and this heavy fleece often causes them to be too warm and to perspire very freely; it also makes them bulky and able to get about in the pens less easily; and where one happens to be lying down, the others are liable to stand on its wool, thus pulling so severely as often to make sore and inflamed places under the skin, and again, all the ticks on any flock at "shearing time" will be found on the lambs, and by shearing them, 99-100 of these pests will be removed with the fleece, the few remaining can be more easily killed. Few people are aware how many ticks a lot of lambs that have not been treated with an insecticide, are carrying; and a dozen ticks on each lamb are enough to eat and worry it to a point that is fatal to any profit in feeding. Thousands of lambs die annually of the so-called "gruh-in-the-head," where the real cause is an abundance of sheep ticks. This is no guesswork, as we have made repeated examinations. We once sheared a flock in which was one "little runt" weighing less than 20 pounds, that carried, by actual count, over 2,000 ticks, and when shorn and freed from these, it made a fine lamb, weighing, in Spring, when sold, over 75 pounds, whereas if left unshorn, and with the ticks, it would have perished long before Candlemas Day—"eaten up alive." So it is not only humane but profitable to shear the lambs. We usually commence to shear in December, the time depending much on when we get the fall work all out of the way, and we finish shearing as soon as convenient. When shearing, and for a few days afterward, of course, the barns must be kept a little closer and warmer than at other times, and then be gradually cooled by ventilation till at the end of a week there will be no further danger of their taking cold.

TREATMENT AFTER SHEARING.

It is also a good plan, a few days after shearing, to give them a good carding and brushing, treating them at the same time with a mixture composed of lard, or lard oil two parts, raw linseed oil one part, kerosene (or, better, crude petroleum) two parts, the whole colored with burnt umber and well mixed. It should be used as hot as it can be borne by the hands, and can be applied with a sponge, cloth or brush and well rubbed into the wool and skin. This may seem to be a disagreeable thing to do, but if two persons dress themselves in old clothes and have two dishes of the mixture and a kerosene stove in a convenient place to heat one dish as they are using from the other, the operation can be very rapidly performed and it will kill every remaining tick, cure any eruption or skin-disease with which the animals may be troubled, and stimulate the wool to an even, rapid growth, and, withal, it gives the whole flock a uniform, nice color, which alone would be worth the trouble.

JOTTINGS.

It will be remembered that when we were raising the new barn, the neighbors thought it was so large it would never be filled. But on a farm on which stock is largely winter fed and much food rich in nitrogen and phosphates is brought and consumed, and the manure is judiciously applied, it is very difficult to have barns large enough to hold all that is grown. The result has been we have our barns full to overflowing, and two stacks of straw out-of-doors, which, though looking like pigmies beside a barn 90 feet long and on a nine-foot basement and with 20-foot posts, are each large enough to fill a barn 30x40-feet with 16-foot posts.

We are always sorry indeed to be obliged to put straw in stacks. Good straw, well saved, for feeding to fattening stock, which eat largely of oil meal, cotton-seed meal, bran, etc., is worth half as much as clover hay, and is a very necessary component of feed, and it is impossible to put it into stack without a great loss even in the best of years; but in a Fall like this, it is worth no more than half as much as if well housed. It pays to build straw barns even!

WHAT ABOUT THOSE POLAR SHEEP.

Lieutenant Greeley in an address at Pittsfield, Mass., says that during his long arctic explorations he passed through a district of country in which were numerous droves of wild sheep. They had large heads with horns like cattle; their tails resembled that of the horse. Their fleeces were of the finest and thickest wool equaling, if not surpassing, that of the Merino. Now if these sheep are a reality, why would it not pay some enterprising citizen, or the Department of Agriculture to make an effort to introduce, and if possible acclimatize them. If they can live and thus thrive in that inhospitable country, there may be great possibilities in breeding them pure, or crossing with our domestic sheep. Who knows?

Dairy Husbandry.

IOWA STATE DAIRYMEN'S CONVENTION.

(RURAL SPECIAL REPORTS.)

Slim attendance; slight interest among dairymen; burdens and pleasures of woman's life on the farm; leisure hours on the farm; food adulteration; corn fodder for milk; better farming needed; profit and loss in dairying; book-keeping on the farm.

THE twelfth annual convention of the Iowa State Dairymen's Association opened in Belvidere on the afternoon of December 9, and continued until the afternoon of the 11th. The attendance at the day sessions was quite moderate, and mainly composed of people from a distance who had something to advertise. The evening attendance was larger, owing to the presence of the citizens of Belvidere. This does not speak well for the interest which the dairymen of the State feel in advancing the welfare of their own calling, which seems at present to demand their special attention. The admission was free, so there could be no excuse on the score of poverty, unless the dairymen are too poor to pay railroad fare, which was reduced to one-half for this occasion. Those attending the sessions were sufficiently attentive, and earnestly participated in the discussions. The President, in his opening address, reviewed the situation, using hopeful language and calling for united effort to suppress counterfeit dairy goods and to improve the quality of dairy products while reducing the cost of manufacture.

Mr. J. C. Lambert pointed out the many burdens and pleasures of woman's life on the farm, and how by careful attention these burdens may be lightened and the home life made pleasanter and more beautiful. It is not all drudgery that brings the best reward. There must be planning and system for lightening the labors of the household, and to give time for recreation and reading. It is not always the hardest worker that does the most work. The brain and muscle that have proper rest and recuperation are much more effective than those that are always kept in a jaded condition. There is sometimes real economy in rest.

Prof. C. E. Mann showed how the leisure hours on the farm could be spent pleasantly and profitably, making a general survey of the whole and picking up or bringing up the little odds and ends here and there, much as an artist puts the finishing touches to his work and thereby produces a master-piece. It is not necessary for one to spend his leisure hours in idleness in order to secure the best results to body and mind. A little gentle exercise and clear, calm thought are much more recuperative and beneficial.

Dr. Joseph Tefft enumerated many articles of food and their mode of adulteration, in these degenerate and grasping times, and expressed the opinion that the increase of insanity in the United States is largely due to the effects produced by the adulteration of food. A man may be poisoned and yet no immediate symptoms may appear; but from the constant eating of poisonous ingredients their effect becomes cumulative, and the man in the end as surely dies from poisoning as if he at once took a dose sufficient to produce death. He thought we ought to have some sort of effective legislation to suppress counterfeiting and fraud in the manufacture and sale of all kinds of human food. It is much more injurious to assail a man's health than to assail his pocket.

Prof. W. A. Henry, of the Wisconsin University Farm, has found corn-fodder a very valuable article, when fed in conjunction with some more nitrogenous food, in the production of milk. His corn-fodder was well cured in the "stout," and then cut very fine by running through a powerful cutter. There is about one-third waste in feeding corn-stalks whole. When cut fine, they are all eaten. The Professor is making experiments with fodder-corn, both cured and ensilaged, and expects it to prove a valuable feed in both forms.

Mr. T. D. Curtis called for a halt in exhaustive farming, the cultivation of less acres and an increase instead of a diminution in the productiveness of the soil. Our public lands are nearly all taken up, and the time is not far distant when we shall have a greater home demand for food and raw material than we shall be able to supply by our present methods of farming. He pointed out the enormous wastes from not saving the corn-stalks and straw on the Western farms, and from the lack of shelter for farm machinery and live-stock; also from the unscientific methods of feeding.

Mr. W. R. Hostettler finds that profit and loss in dairying depend upon the greater or less amount of skill and judgment manifested by the dairyman. Careless, slip-shod management can never make dairying profitable, and even the neglect of any essential must materially injure the product and depreciate its value. From the most general management to the minutest detail, everything must be done in proper time and in a thorough manner.

Mr. E. L. Lawrence was of the opinion that bookkeeping on the farm is but another name for systematic and efficient farming. He had not found the farm account books peddled by agents as satisfactory as a pocket memorandum book for the entry of every item, of whatever character, to be posted at the earliest convenience under its appropriate head in a common ledger. The agent's farm account book is based more on theory than practice, and is too complicated, or runs too much into small details, for the use of the ordinary farmer. T. D. C.

DAIRY NOTES.

T. D. CURTIS.

ADVANTAGES AND DISADVANTAGES OF ASSOCIATED DAIRYING.

WHILE associated dairying has its advantages—among which the educational are not the least—it also has its disadvantages. It is difficult to make patrons conform to the necessary rules and regulations to secure uniformity of product of the highest quality. Dairies, farms, feed, care and the quality of milk differ so much, that it is next to an impossibility, to say the least, to secure justice among the patrons. The poor milk counts for just as much, pound for pound, in making dividends, as the good milk. Then, owing to the impossibility of controlling all the conditions in producing and handling the milk delivered at the factory, neither butter nor cheese of as good quality can be made there as can be turned out by the private dairyman who understands his business and has everything under his immediate supervision. Hence, I am no surprised to see it announced that a majority of the premiums awarded at the dairy exhibit made in conjunction with the late Chicago Fat Stock Show, were awarded to private dairymen.

FUEL CHEAPER THAN FOOD FOR HEATING.

Dairymen who are studying economy will find fuel cheaper than food for heating purposes. It is better to have warm stables, even if artificial heat has to be resorted to for the purpose of keeping the temperature above 40 degrees, Fah., than to put extra feed into cows, every cold snap, to keep them from shrinking in their yield of milk, because more of the food goes to sustain the proper amount of animal heat. It is always a great waste to burn food for heating purposes, and in no way can it be done so wastefully as in the animal system. Not only is the consumption great, but the animal organism is over-taxed and deranged by compelling the animal to eat an extra amount of food to keep warm. But where there is exposure to cold, extra food must be consumed or the tissues of the animal are drawn upon for fuel. This causes decline in flesh and makes too heavy a draft on the vital forces. It is therefore economical, as well as humane, to keep cows in a warm stable, where they will not stand humped up and shivering.

VENTILATION IN THE STABLE.

See that your stables are properly ventilated as well as warm. Impure air is inimical to the health of all animals—as much so to the bovine race as to man. Besides, nothing will so soon give a "cowy" flavor to milk, or the smell of the stable, as the breathing of an atmosphere reeking with the exhalations from the bodies of the cows and from their droppings. Ventilate, but avoid direct drafts.

CLEANLINESS IN MILKING.

Do not let filth drop into your milk-pail on the supposition that the strainer will take it out. Much of it will dissolve, contaminating the milk and injuring its flavor. Now that cold weather makes it necessary to keep cows mostly in the stable, it is all the more important to pay attention to the subject of cleanliness.

SPECKS IN YOUR BUTTER, EH?

Why do you set your milk in an atmosphere so dry that the surface of the cream becomes tough and wrinkled? How do you expect the hard lumps are going to be churned? If all the cream is kept limpid, where do you suppose white specks could come from? Are they not unchurned lumps of cream?

MILK AN ABSORBENT OF ODORS.

The kitchen is not the fittest place in the house for setting milk. It may be warm on the rack, or on the shelf next to the ceiling. But do you not know that foul air, when warm, rises and that cream has a strong affinity for odors? If the milk is cooler than the atmosphere in the room, the temperature having gone down during the night when the fire was low or out, it will surely take in the kitchen odors. These are not improved if there is smoking in the kitchen—as there often is. How can good-flavored butter be made of

cream raised in this way? One of the main reasons why winter butter is inferior to summer is because all the operations of making are carried on in an atmosphere loaded with impurities. In the Summer, there is better ventilation, and no one thinks of setting milk in the kitchen. It is much better, if no other room is to be had, to make use of some of the modern devices for raising cream with the milk shut in from all possible contact with the air in the room. Then churn in the sweetest place in the house, even if it is the parlor.

You can easily see that the big cow needs more food than the smaller one. So does the cow giving milk want more food than the dry one standing by her side. Yet you feed all alike, great and small, the workers and the idlers. This is all wrong. Use a little common sense, and feed each individual cow according to her needs. This will also be economy.

Be sure that your cows have a fair amount of succulent food and all the salt they want, and it will do very much to obviate difficulty in churning. Proper attention to temperatures will also help. Do not freeze and thaw your cream, but keep it at an even temperature of about 60 degrees, and churn at that temperature.

The Swineherd.

PIG DIET.

COL. F. D. CURTIS.

Grass the foundation; necessity of cooling with heating food; overfeeding; a little and often; oats for pigs.

THE foundation for pig growth should be grass, as it should be the foundation for the growth of all stock. It is the cheapest food given to us and the most natural for domestic animals. Pigs when only three weeks old will begin to eat grass, and they will *live* on it when three months old. When they have the range of tender grass or clover, they may safely be fed on any kind of other food. They will stand corn in abundance, having the grass as an antidote and additional food. The grass is cooling and life-inspiring, and a complete food. Give me a farm of grass; grass in abundance, above all other things. Cooling and relaxing foods must be given to young pigs along with the heating and constipating foods, or there will be trouble. This is no mere theory, for a whole litter of dead pigs are the silent evidence. Their first trouble is scours—the first, and often the last trouble with young pigs. If they pass this ordeal, which is the result of dyspepsia—yes, hogs too, have it and sometimes get rid of the cause by vomiting, a human expedient—then the next thing is either constipation or dysentery. Inflammations of the stomach, liver, kidneys and bowels are diseases consequent upon feeding pigs too rich food, or food in such a condensed form, as corn.

The most trouble in caring for young pigs is, that they get too much food into the stomach at one time. This is wrong when it is concentrated, as the mass is indigestible, and it is deleterious when thin and bulky, for then it produces a distended and unnatural size in the stomach and puts the pig out of shape. Pigs will stand a great deal more nutritious or rich food if it is given to them in small quantities and every two hours. They have naturally a strong and quick digestion, when it is not clogged or over-crowded. The way to keep up their stamina is to feed little and often, and always in a *clean trough*, and to give them the run of a pasture. The earth is an appetizer—the fresh, clean earth, and not a mire hole—and pigs sick all the way through, will often get well if allowed to dig in it and live on it. I do not think there is any single grain equal for young pigs to oats fed dry, the pigs being allowed to eat all they want in connection with their mother's milk. It is a waste of time and toil to pay for grinding the grain, for to do this is simply amusement for the little fellows, which become adepts at the business of grinding, swallowing the "meats" and spitting out the hulls at the sides of their mouths and looking wise and happy at the same time.

Horseman.

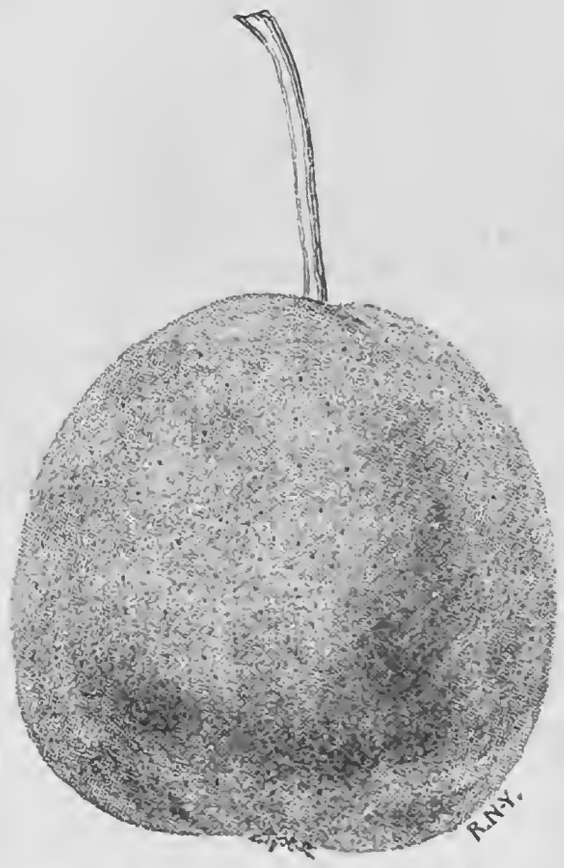
SHOULD WE SHOE OUR HORSES?

J. SINCLAIR.

Need of a school of farriery; the object of shoeing; the best shoe; putting it on; unshod horses unfit for hard roads.

THIS is really the question discussed by the Rev. J. G. Wood, in the interesting book entitled "Horse and Man," which has just been published in London. The book extends to 338 pages and of these 197 are occupied with an explanation of the anatomy of the hoof of the horse and of the prevalent methods of dealing with it. In view of the importance of the hoof, the space devoted to the consideration of that subject is not so disproportionate as might at first sight appear. The old adage "no foot, no horse," is becoming more and more verified as the breeding of this faithful servant of man becomes better understood. It is certainly a most remarkable circumstance that all the trouble of the breeder should be imperiled by handing over the animal to an untrained class of artisians who are allowed to work their will on the hoof. There is no more pressing need of the present day than the establishment of schools of farriery in which the men who are to be entrusted with the adaptation of the horse's hoof to modern needs and requirements may be taught the anatomy of this marvelous piece of mechanism, and how it can best be fitted for uses to which it was not originally designed.

With regard to shoes and shoeing, the object of the shoe is to benefit the horse by protecting the hoofs against the hard, artificial roads of civilized countries. It is always assumed that such protection is neccesary because, although the horse might do very well without these appendages in its native pastures, it must need shoes when it is brought under such different conditions, and has to traverse stone-paved roads, when it carries a rider, or draws a vehicle. Mr. Wood does not concede the accuracy of this assumption; but for argument's sake he passes in review the various systems of shoeing, that have been or are in use—such as the Japanese which consists of shoes made of straw and worn like sandals, and the "parfleche" shoes employed in North America. Then he comes to the multitudinous variety of iron shoes nearly every one of which he, as I think correctly, con-



NEW PEAR DR. REEDER. Fig. 3. (See p. 1.)

demns, his censure of the use of calks being particularly well deserved.

If the horse must have a shoe (which Mr. Wood denies) he believes the Charlier sort complies most nearly with the condition of interfering least with the natural growth and action of the hoof, it being extremely narrow and very light, while its essential excellence lies in the fact that it is not nailed upon the hoof, but is counter-sunk into the horn so as to be flush with the natural edge. He considers that a quarter shoe is all that is required. It should be four inches in length and one-eighth of an inch in thickness.

"A little art," he says, "is required in attaching this shoe. Round the edges of the hoof a groove is cut, and into the groove the shoe is sunk. The groove should be fully as deep as the thickness of the shoe, and even should it be a little deeper, no harm will be done.

There is no difficulty in cutting the groove, as in all places where the Charlier shoe is sold a special knife is supplied. This knife is a variation of the ordinary draw knife, and is furnished with a movable guide by which the dimensions of the groove are regulated. The guide can be set to any point, and fastened by a screw so that even the most careless operator can hardly make a mistake."

The hoof must be fitted to receive the shoe, and I am not quite sure that the process is so simple as Mr. Wood endeavors to make out. Still, the danger is undoubtedly less than by fixing on clumsy iron shoes with long nails, and the Charlier pattern has its great recommendation in not interfering with the various functions of the organ.

The author advances some half-dozen cases in which horses have been successfully used without shoes, but even as to these, there is not sufficient proof to establish his contention, because the animal may have possessed unusually good hoofs. But he leaves us without a single bit of evidence as to the successful use of unshod horses in the city busses, in drays and in agricultural work.

There can be no doubt that the existing methods of shoeing, and the people to whom that delicate operation is entrusted, stand in need of improvements. In drawing attention to this latter circumstance, Mr. Wood has rendered a public service, but he has not rescued the advocacy of unshod horses from the region of the "fads."

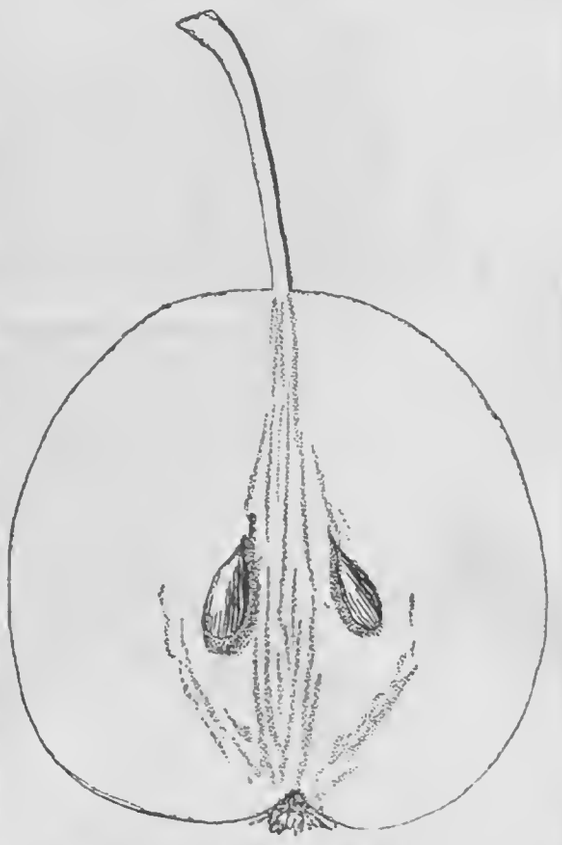
Farm Economy.

WINTER CATTLE FEEDING IN THE WEST.—NO. 4.

A correction; shiftlessness in Western farming an undesirable inheritance; higher farming alone generally profitable; nine savings by sheltering stock; convincing figures.

IN No. 3 of this series I say: "Winter feeding of cattle is bound to decrease until the relative values of winter and summer-fed beef grow wider apart, and summer beef increases in value in accordance with the decreased per cent. of winter-fed cattle." I should have said, in place of "summer beef increases," "winter beef increases."

Having pointed out, as I believe, a method within the reach of Kansas farmers, by means of which they can do better than sell their corn for 30 cents a bushel, or at least better than the common method in vogue, I will now exercise my prerogative and advocate a system which my questioner assures us is beyond the reach of his neighbors. Basing my



NEW PEAR DR. REEDER Fig. 4. (See p. 1.)

observations upon experience of a decided sort and upon wide observation, I most emphatically dissent from the view that lack of capital need confine men, as a rule, to a vicious system of farming; and, furthermore, I as strongly dissent from the quite prevalent opinion that waste and unthrift in farming are unavoidable at the West. I have no contest upon the probable necessities of pioneer farming here, but believe that the views now held on this point by Western farmers are in the nature of an undesirable inheritance that should be shaken off.

I am not content with the reluctant admission that high farming may pay. The truth is that a higher type of farming is the only kind that will pay the great bulk of our farmers. By dint of the highest genius in farm mechanism, and cheap transportation, we have by spoliative farming controlled the markets of Europe. We are now facing a new order of events, and our genius must be turned from mere mechanical farming into the deeper problems of the farm that in their relations all center towards higher products. I believe that I can give a young man of our great West no better advice than to throw off every tradition or habit that binds him to waste and soil robbery, and lay broad and deep a conserving system of farming whose yearly steps shall be up the ladder of greater fertility, growing more and more intensive with accumulating means, until the pleasures and profits of constructive farming have passed, as an inheritance, to the children. The West will make its way in farming in the future against the world, through better farming. Thorough knowledge of modern agricultural thought, and common sense, will make reenperative farming pay from the start in the West, and will swell in volume year by year. No more capital is needed for good than for poor farming; but a strong purpose and a good head are essential, and a few years of patience. The rich only can afford a low type of farming.

Humanity says shelter will pay. Shelter for 100 cattle and 100 hogs will cost, say, $3,000, or $250 a year in interest, repairs and insurance. I do not allow full rate of interest, as a farm with a barn on it is scarcely taxed any more than one without, and the net value of the money only is to be charged.

Shelter makes a ninefold saving, to wit: in food, growth, manure and earlier maturity, as well as in the amount of food leached from the stack, wasted in the stack when eaten, and injured in the stack by rains, and also in the poaching of fields by cattle pasturing, and by opportunity to combine and handle all of the foods of the farm to the best advantage. Will not all these savings pay on 200 cattle and hogs $250 yearly, and the extra cost of care? Beyond a doubt they will.

In the following estimate, I have made my figures within the truth, or less strong than they can be safely made. While I do not give the data upon which I make my figures, I wish it distinctly understood that all of the more important estimates are based upon experimental data obtained either by myself or by others.

Saved 4 pounds of hay daily for 140 days for 100 cattle; hay $6 a ton	$168 00
" 1.17 pounds corn " " " hogs, corn 28c. a bushel	82 00
" On 5 per cent. death rate of hogs	25 00
" " 1 " " " cattle	30 00
" " quality and early marketing by constant winter growth	100 00
" " that would be leached from a stack by rains	115 00
" " 20 per cent. (estimated) that would be trampled under foot when eaten from the stack	180 00
" " 32 acres of corn fodder and straw on a 160 acre farm, by housing, will keep 20 steers more than if eaten off in the field	240 00
" " 400 tons of manure (liquids and solids) at 50 cents. This manure will be the most profitable saving of all.	200 00
Total savings (excluding some minor savings to balance any possible over-estimation)	1,140 00
SHELTER, DR.	
Extra cost of housing 150 tons of hay	$50 00
" " " 48 tons of straw and corn fodder	80 00
" care of stock	100 00
Drawing out manure	100 00
Total cost	330 00
Net gain	810 00

It will be seen that I would house cattle, save all of the straw and corn fodder, and use the manure systematically. We have but touched the possibilities of over-farming.

Ag'l. College, Columbia, Mo.

PROFIT IN FEEDING WESTERN STEERS.

I CERTAINLY must protest against the rough handling given to us Western farmers and cattle feeders by Professor Sanborn.

In the RURAL of Dec. 5th he figures up the loss on a steer by winter feeding. I will take his own figures and prove there is a fair profit, for these hard times. Before he made up his account he said that corn was worth, in his county, only 20 cents a bushel; but in his account he figures it in at 30 cents; now there would be a saving of $9. Again he charges $5 for one ton of hay. I never knew a feeder who fed more than one-third of a ton per steer in 100 days, and some, instead of hay, feed straw which otherwise would go to waste: $3 must be deducted on this account. Then again, he figures interest and risk on shoates. Pshaw! Just as if every farmer does not have his own shoates, and wouldn't the risk be there if he did not feed? So drop 60 cents here. And, finally, he charges $1.50 for care, sales and delivery, just as though it would not cost five times as much to haul that 20-cent corn 8 or 10 miles to market as it costs to feed it, and drive the steers to market. In his table he figures a loss of $1.48.

Difference of 10 cents per bushel on 50 bushels of corn	$5 00
" on " " hay	3 00
Risk and interest on shoates	0 60
Care, sales and delivery	1 50
	$10 10
Less	1 48
Clear gain per steer	$8 67

The Vineyard.

GRAPES, PICTURES AND PEARS.

G. W. CAMPBELL.

Pictures to represent possibilities, not realities; an exceptional specimen; an excellent error; clusters on old larger than those on young vines; examples; the miserable Kieffer, and wretched Comet-Lawson.

IN noticing the 18th Report of the Ohio State Horticultural Society, the RURAL fears most people will be disappointed who plant the Empire State Grape, expecting it to equal the illustration. The remark is doubtless just as applied to "most people," and I may say

also, as applied to most illustrations of new fruits, as given by their originators or introducers. It is, however, generally understood, I think, that these illustrations represent what can be grown by extra care, rather than what may be expected under neglect, or ordinary treatment. [This is a very unsatisfactory practice and one which we think not to the advantage of the propagator. It is much better to have a man happily disappointed. EDS.] And, although the illustration of the Empire State certainly represents fruit much larger than the variety will produce under average treatment, I have reason to believe it has been, and can be grown to equal it. In the autumn of 1884, I received a cane about 18 inches long, bearing four consecutive clusters of the Empire State, which was exhibited at the Ohio State Fair. The two inside clusters were each, very nearly, if not quite, equal to the illustration; the other two about one-fourth to one-third less. I do not hesitate to say that these were the handsomest four clusters of grapes I ever saw, of any variety, growing upon one shoot; and all the oldest and most experienced grape-growers of Ohio, who saw them, said the same. This it was that induced me to publish the illustration in question. I had fruit upon the young vines the past Fall, but the clusters ran not one-fourth the size of those in that picture: and instead of being as has been claimed, "as early as Hartford," it was not earlier than Concord. In other respects, it was very satisfactory, foliage healthy, growth very vigorous, ripening its wood perfectly:—and it would not surprise me, if I were able, next Autumn, to send you clusters, "equal to the illustration."

I have sometimes thought the RURAL'S illustrations were hardly just to some varieties, as young and undeveloped plants in their first or even second year's bearing rarely produce as large or as fine fruits as older ones. But the error, if any, is a safe one, and certainly more satisfactory in the end than overdrawn exaggerations upon the other extreme. When the Pocklington was first introduced, I thought the pictures monstrous exaggerations; but I saw afterwards, at the meeting of the American Pomological Society at Boston, and have seen several times since, specimens larger than those in the pictures. [Those clusters were evidently grown on vines that had been in some way manipulated.-EDS.] And the Duchess also: the first and second years I fruited it, the clusters were so small as to be almost insignificant. But the same season, Mr. Caywood exhibited, at Philadelphia, specimen clusters over a pound in weight and larger than those in the pictures which had been published illustrating it, and since my own vines have grown older and more fully developed, I have grown clusters nearly as large.

The colored illustration of the Niagara Grape, I should say was rather below than above the average size of what may be expected, under good cultivation, and for this its introducers deserve commendation.

I am really glad to see the stand the RURAL has taken as to the Kieffer Pear; and it would have saved a world of loss and disappointment and perhaps a great deal of profanity, if all horticultural editors and teachers had taken the same course. Instead of being "blight-proof," as claimed, it has blighted here more than any variety I ever planted, and the tree has proven, under our severe Winters, no hardier than the peach. I had a few trees, but blight and cold finished them all up last Winter, and since tasting the fruit on several occasions, I am not sorry they are all dead. I never desire to plant another tree or taste another Kieffer. And now comes the Comet-Lawson, with the recommendation that it is handsome in appearance and will sell. Can its introducers name a poorer pear, unless it be the Kieffer or Le Conte, or one more worthless, except in appearance? It may *sell*, but I think not *twice* to the same customer.

Delaware, O.

Horticultural.

STRAWBERRY TESTS.

THE report of the proceedings of the American Pomological Society in the RURAL was very good, and has doubtless called out considerable discussion on the different varieties of fruits, if fruit growers generally feel as much interested in it as I do. The time allowed for discussion of each kind of fruit was, however, necessarily too short to do justice to the subjects. One matter of surprise to many was the evidence that the old Wilson Strawberry must go to make room for better kinds. This is a great small fruit region, and it has been a common remark among extensive strawberry growers that if the Wilson could have as good a chance as the new kinds, it would pay as well; but the past season has been death to it, as the crop was very heavy here, and prices ran low, and very few Wilson growers claim any profit, owing to the fact that the foliage rusted in many cases, and where the crop was good the prices hardly paid expenses: while the growers of Crescent and Sharpless all made some money, and in one case a field of Sharpless is said to have netted $500 per acre. The berries sold from $1.75 to $2.75 per case of 16 quarts, while Crescents sold from 90 cents to $1.75 per case, and the expenses in either case were as follows: Picking, 24 cents; crates, 12 cents; freight to Chicago, five cents (last year, two cents), making the total expenses 41 cents per case for berries laid down in Chicago, while thousands of cases of Wilsons sold for 25 to 40 cents.

Two years ago I started an experiment on the theory that the Wilson would respond to high culture as well as any, and prepared a small plot nine rods long and two wide, by manuring heavily and by giving it a dressing of 500 pounds per acre of superphosphate. I set two rows of Sharpless, two of Crescent, one each of Manchester, James Vick and Wilson, and cultivated well until Winter, keeping off all runners. Then, late in Winter, when the ground was frozen deep, I mulched with straw from the barnyard, which contained some manure, and left it on until the berries were all picked. I gave my wife the fruit on this patch, and she furnished the house with all our family could eat (eight persons), and canned all we needed, and realized, in cash, after paying for crates and picking, $23.00. The following is the result of the test of varieties.

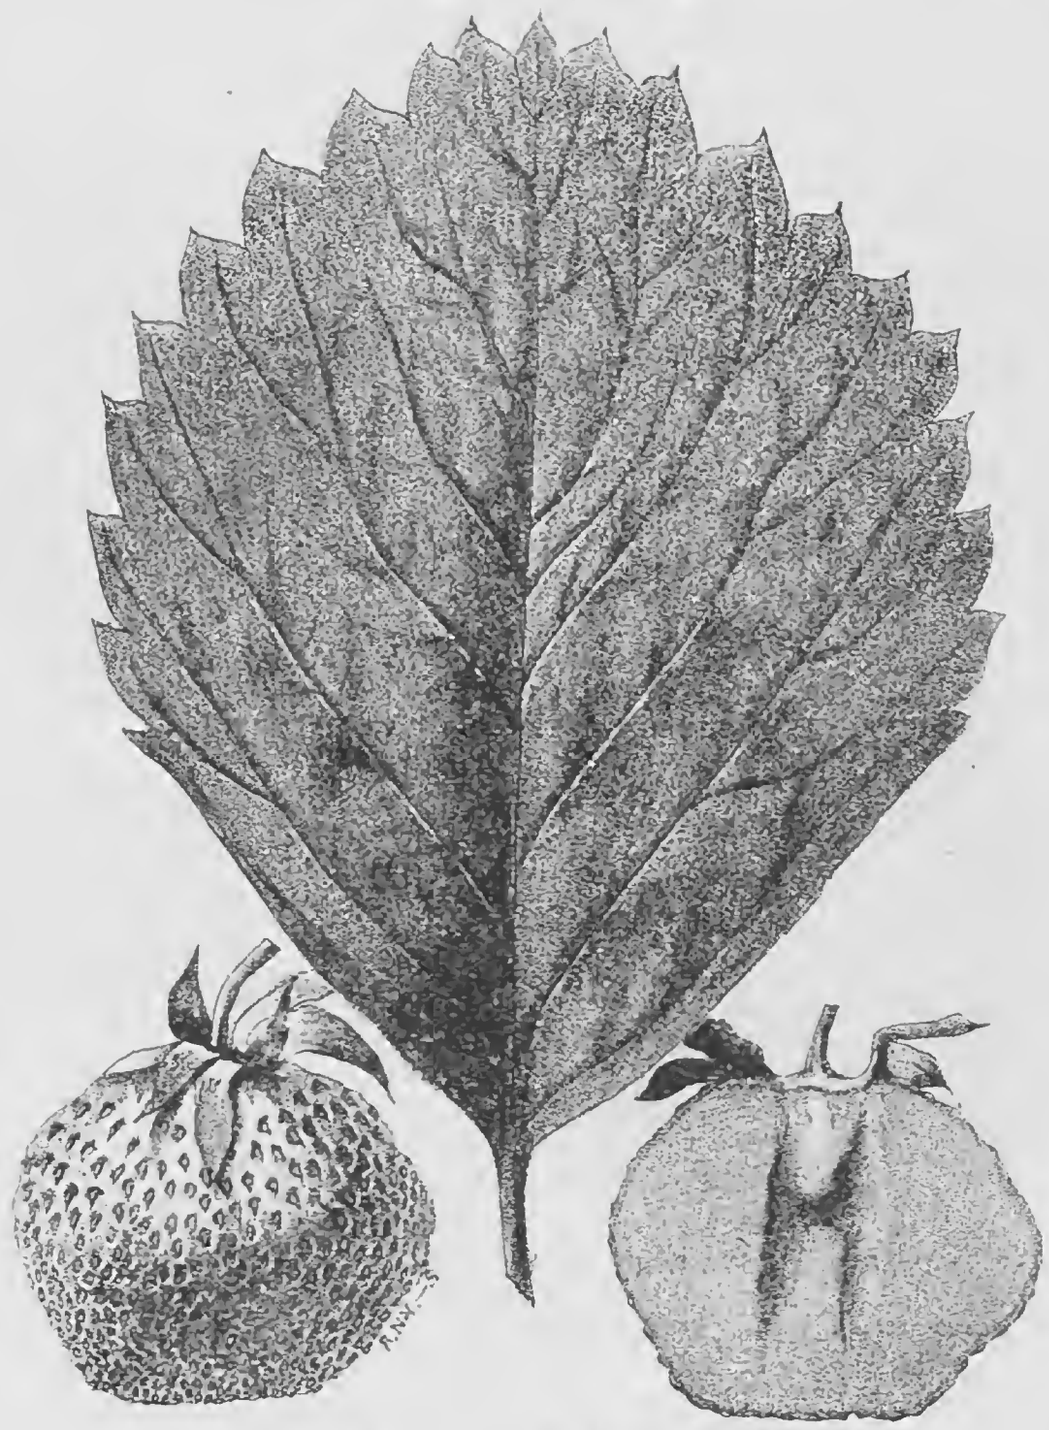
Sharpless, Crescent and James Vick kept perfect foliage; Manchester and Wilson rusted. Crescent yielded the heaviest; Sharpless was second; James Vick third; Manchester fourth; Wilson fifth. In fact, Wilson was hardly worth picking. Sharpless sold for the highest price; Manchester was second, and Crescent and Vick next. My experience and observation sum up about as follows: I would plant Crescent for early and Sharpless for late; but I think it best to caution new beginners that the Sharpless has two serious defects—one is that the blossom is very tender and will kill with a light frost, even before it has opened; the other is that it is very liable to rot on the under side, if it lies on the ground. I remedy both faults by mulching, the mulch being placed on the ground when it is frozen. This holds the frost in the ground and holds the plant back until it generally escapes the frost. The same mulch keeps the berries off the ground and prevents rot. I hope we may find the Parry a match for the Crescent, and the Jewell a match for the Sharpless.

Benton Harbor, Mich. R. M.

ALLEY'S NO. 9 STRAWBERRY.

WE have not as yet this new berry at the Rural Grounds. Our accompanying illustration (see Fig. 2) was drawn from specimens sent to this office by the originator. Mr. E. Williams kindly furnishes us the following remarks:

"Mr. Alley, a mechanic residing at Hilton, a mile or two beyond Irvington, N. J., has a large number of seedling strawberries of his own on trial. His No. 9 he considers his most promising kind. This is a very strong and vigorous grower, very large, late and productive. At the time of our visit (June 23), the berries were just coloring. Mr. Alley uses the Champion as the mother plant, and Sharpless and Great American for the fathers, and depends on nature to do the crossing. The No. 9 is an acid berry of the Champion type. He grows the Champion because he likes an acid berry and finds plenty of customers to take all he can grow. His garden is about a quarter of an acre and is full of fruit in every available space. He has other seedlings, I think, quite as promising."



ALLEY'S No. 9 STRAWBERRY. Fig. 2.

HOW TO FENCE A GARDEN SO THAT IT CAN BE PLOWED AND CULTIVATED WITH A TEAM.

IN the early Spring-time, the average farmer prepares for the year's campaign. About the first thing he thinks of is the construction and planting of a garden. In considering the garden problem, nine out of ten farmers reason thus: "I can't raise poultry and a garden without the intervention of a picket fence. I can't plow a little patch surrounded by a fence, and I'll be shot before I'll dig it over with a spade; I prefer eggs and spring chickens to garden 'sass.'" This conclusion is a very foolish one, but it is the most popular because easiest arrived at. am satisfied that, if the problem of plowing a garden can be satisfactorily solved, a garden will grace every farm, and the farmer's wife, who now tastes fresh garden sass only when a compassionate neighbor presents her with a handful, will fairly revel in crisp and delicious vegetables of her own raising. Here is my solution of the problem:—

Fig. 6 shows how a garden of any size

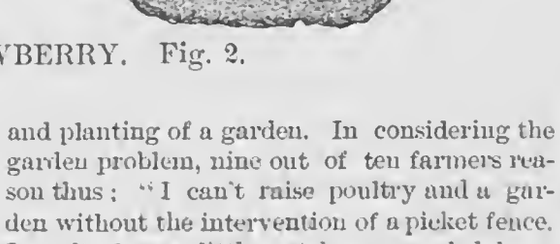


Fig. 6.

should be laid out, *i. e.* oblong. The fences on either side are stationary, while those at the ends are movable. The movable fence is shown in figures 7 and 8. The panels are twelve feet long, and made of four-inch fencing and lath, and are so light that one man can handle them with ease. The crossed laths

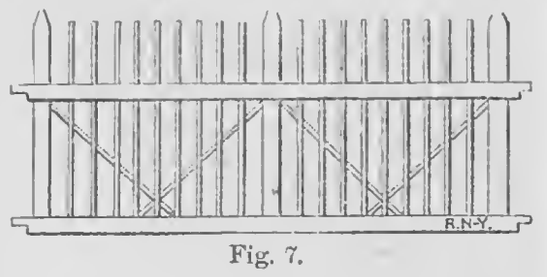

Fig. 7.

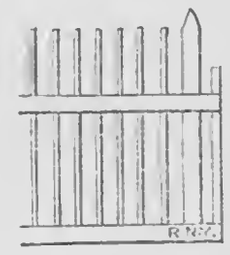

Fig. 8.

Fig. 9.

are placed there to stiffen the panel. The standard is shown in figure 9. It is made of four-inch fencing, and is very light. The ends of each panel fit snugly side by side in the notches in the upper and lower cross-pieces. To keep poultry out of the garden, the angle of the standard is set inside: to keep them in the garden, it must be set outside, or they will climb up it and fly out.

When plowing, cultivating or manuring, move the end fences aside, drive the team straight through, and turn on the outside of the garden. When done, replace the fence. Figure 8 shows how the ends of the side fences are arranged to receive the ends of the movable panels; they fit into the space between the post and outer strips. A person can move the fences, plow, or cultivate the garden—and put it in tip-top order—and reset the fences, while the man with the spade is wondering how long it will take him to dig one corner over.

Now is the time to select the garden spot and manure it heavily. It is also a good time to build the side fences and make the movable panels. "PICKET."

Christian Co., Ill.

FIRE FOR THE CABBAGE MOTH.

Some of our people keep their cabbages free from worms by building small boufires in the cabbage patch about sunset, and letting them burn until dark. The small, white moths that lay the eggs from which the worms come are attracted by the light and burnt. H. G. F.

Farm Topics.

EXPERIENCE ON A RUN DOWN FARM.

CHARLES A. GREEN.

Old-fashioned fire-places; first night on the run-down farm; sights and thoughts on the way; a desolate farm-house; a cheerless night.

MY wife and children having gone to the city on a visit, I am seated this chilly October evening before the old-fashioned fire-place of our run-down farm. I doubt if there are many such fire-places in existence. It was built 40 years ago, entirely of great rocks hewn with skill, furnishing a smooth surface which has not been defaced by the many fires that have blazed upon them. At one side, and entirely separate from the fire-place, was built an old-fashioned brick oven, in which has been baked bread enough to provide for an army. Such was the kitchen fire-place of the early fathers, who have long since gone to that "bourne whence no traveler returns." When we took possession, here sat two huge and-irons capable of receiving a four-foot stick of wood, and overhead hung a monstrous crane, which had borne the breakfasts and dinners of many now sleeping beneath the church-yard turf. As the sticks of beech and maple snap and glow, filling the room with a cheerful light, and warming the chilly air, I recall the first night I spent in this abode.

It was before my family had moved to the farm, and this house was deserted. We were then living at Rochester. Having kissed my babies good bye, I started for the cars that passed near the farm. The sky was bright, and the streets were lively with pedestrians. Bands of music were playing in front of the theatres, dashing equipages were treading the fashionable avenues, and everything wore a bright holiday aspect. The car in which I rode was occupied by a merry party returning homeward, all discussing the afternoon's amusement—or some other plan of enjoyment.

After a short ride, I left the car and started on foot for the farm. Meanwhile dark clouds had arisen in the west, the wind was rising, and there were threatenings of an approaching storm. I saw, as I passed along, a farmer plowing a large field by the wayside. How slowly the team dragged the plow along! How wearily the farmer followed the plow! Thought I

to myself, what an endless job this man has on his hands. It appeared to me that it would require a year to plow the field. Can one who has made a thousand dollars in a day be satisfied with such slow, dreary, unintelleetual work as this? There was a time when I was contented to hold a plow from sunrise to sunset; but that was many years ago, and I had almost forgotten how slowly the plow moved through the soil. Another man was "dragging" in the same field, clouds of dust enveloping him as he plodded on slowly and monotonously through the yielding soil. When a boy I harrowed many fields like this, unmindful of the dust or the wearisome march.

In order to hasten my journey, I struek across lots through a piece of timber. The autumn leaves had fallen, and my tread disturbed the partridge and rabbits by the way. Coming to a clearing, I discovered a man with a long-handled hoe, hauling black mud out of a ditch. His hands were knotty and callused, his face stained with smoke, but his efforts were well directed and pushed with great vigor. I asked if he owned the clearing. He replied that he had purchased it three years before. I noticed that stumps and fallen logs were burning in different parts of the field, apparently receiving his attention, and I inquired if he had been at this work of clearing up all Summer. He replied that this was the third year he had been at work clearing this tract, the whole of which did not embrace over 20 aeres, and could not have been worth more than the labor he had expended upon it, as much of it was low and undrained. A slow way of making money, thought I to myself, as I marehed along.

I had visited our farm only once before, and then only hastily. I arrived at the farmhouse at dusk, and as the doors were not bolted, I entered uuhindered through the baek way. If there is one thing more desolate than another, it is an empty farm-house on a run-down farm. The plastering was torn from the walls, glass was often missing from the windows, the paint was scratched and soiled on the wainscotting. The only ornaments the rooms contained were an old broken chair and table in advanced stages of dilapidation. I hastily built a fire in this same fire-place, which soon beamed forth merrily, and did much to dispel the loneliness of my surroundings. This done, I looked out of the window upon the garden, which was in keeping with the general desolation; the bare arms of tall weeds swayed in the wind, half dead trees were straggling about in every direction, striving to keep up with the fences in their crooked rambles; ancient grape-vines as large as my arm were hanging without support, and everywhere as far as I could see, there was a general break up of order, and a reign of confusion and abandonment. Having nothing to read, or otherwise amuse myself, and being exceedingly tired, I hastened to my cot, which had been sent on in advance. I did not know a soul in the vicinity, and had no idea whether I might not be located among a lot of horse thieves, or worse. The question arose in my mind as the midnight darkness came upon me, whether in case I was surrounded by such a class I might not be disturbed in my slumbers by a demand for my money, or my life. As the night progressed, the October winds howled and whistled around the corners of the house, rattling the crazy blinds and throwing out the old hats and other temporary barricades that had been placed in the broken windows. I remember placing a boot-jack against one broken glass, and thrusting a pillow in another, the night being quite cold, and the blast exceedingly uninviting. As the embers on the fire-place grew dim, I discovered that I was not alone in the house as I had supposed, for one after another numerous enormous rats made their appearance dancing in the most convivial manner, now over the floor, and now over the bed in close contact with my nose.

Thought I to myself, here's an experience! Here I am, a boy who has spent 12 years of his life behind the cashier's desk of a commercial house in the city, handling greenbacks daily by the barrel, now transplanted to this dreary, desolate, tangled, stumpy, rocky, undrained, untilled, run-down farm. Of course, every one will prophesy failure, and a hasty return to the city. Will their predictions be true? Will these hands that have grown white and soft endure the blistering of the hoe and pruning knife? Will the wife and children accustomed to the luxuries of the city, be contented in such a desolate place?

For myself I had no fears, for I had been born and bred a farmer. Had it been otherwise my success would have been exceedingly doubtful. But as it was, I had a good understanding of all I was about to undertake, and knew it was not a holiday undertaking, but a hand to hand struggle with the elements. It is natural to seek positions of ease, and to shrink from such tasks as I was about to undertake, and yet, positions of ease are not for our good. We would choose to be sheltered like some weak tree in the midst of the forest. How much better that we should stand alone, exposed to the blasts on the hill-top, that we may send our roots deep into the soil, and accumulate knotty arms that the tempests cannot break down.

As I lay looking into the dying embers, the wind died away gradually, the rats, seeming to have satisfied their curiosity concerning me, had scampered away, and when next I regained consciousness the morning sun was beaming in upon me from the windows.

What Others Say.

HYDROPHOBIA.—The recent "mad-dog" excitement has called out a multitude of articles on hydrophobia and its treatment. It is well that the public should be educated in this matter. Hydrophobia is the most horrible disease imaginable. Statistics show that it is far more prevalent than has been supposed. When we consider the damage a single rabid animal can work in a community, there is grave reason for apprehension. The experiments of M. Pasteur may lead to a practical and satisfactory treatment of the disease: yet it will be years, in any event, before this treatment can be made general. In many instances the disease develops in so short a time, that a journey for treatment, as is now necessary, would be impossible. Prevention is far better than any possible treatment. The history of the disease in England and in Europe will show that the number of sufferers has always been rapidly diminished whenever the people became nervous and consequently took better care of dogs. The disease is always communicated to man by dogs, and hence the only means of stamping it out seems plain. Prompt and decisive measures are needed, particularly in the large cities. Every homeless and wandering dog should be killed at once. All dogs running at large, should be securely muzzled. Every license should have, printed plainly upon it, the symptoms of rabies in simple and easily understood language. The owner of every licensed mad dog should be held to be guilty of a crime. It is thought that many persons are frightened into the disease. People generally believe there is no cure for it, and immediately after the bite, give up in despair, leaving the mind in just the condition to aggravate the trouble. The truth of the matter is that hydrophobia does not always develop from the bite of a rabid dog, and that with prompt treatment and strong will power, the disease may be warded off in a majority of cases. The most dangerous wounds are those inflicted upon the hands, face or other exposed portions of the person. A bite through the clothing is rarely dangerous. Dr. Alfred Jewell, a distinguished English veterinary surgeon, in a recent lecture on this subject, said a wound inflicted by a rabid dog should be immediately washed with cold water; placing the part under a tap and allowing a free stream of this fluid to run on it is best. The wound afterwards (provided the person has no sores on the lips or tongue) should be well sucked, and caustic should afterwards be applied. Suction alone should never be depended on. There is a difference of opinion among medical men as to which is the best cautery. Some recommend one kind and others another. Nitrate of silver is very effectual for superficial wounds or scratches, but for a deep puncture the free application of nitric acid is best, as it is more penetrating than the former caustic. It would be dangerous to persons with decayed teeth to draw the virus into the mouth. "Mad-stones" so frequently used in some sections, are of no use in determining the disease. If a friend is bitten, carry out the instructions noted above at once, and keep the patient impressed with the idea that his wound is not dangerous, and that he will recover.

THE SPARROW A PEST EVEN IN ENGLAND.—Miss Eleanor Ormerod, in speaking of the sparrow, says that the yearly increase of this national agricultural pest, and the consequent loss on grain crops, taken in connection with its avoidance of insects and its driving away of those birds that do feed on them, require prompt measures and steady treatment to rid the nation of the nuisance. And yet many are found who argue that the little Englishman is not a pest on our shores!

A GOOD TEST OF MILCH COWS.—Our Scotch cousins, as we learn from Bell's Messenger, have very level heads in many particulars. For instance, last August there was a trial of cows at Edinburgh, which had many features that could be followed on this side of the water. The prize for the best cow was not given to the animal giving the largest quantity of milk, nor to the one giving milk of the best quality; but the two milkings were weighed and the quantity of milk set down, a certain number of points being allowed. The total solids were then ascertained, and two points for every one per cent. were allowed. The time since calving in days was then given, for which 1-10th per cent. was allowed. These points were then totaled, and if the fat had failed to reach a certain standard, a deduction was made, which told against the cow. Thus, for example; take one of the prize cows she had calved 123 days, and received 80.56 points, as follows:—

	lbs.	points.
Weight of milk in 24 hours	32	32
Total solids	13·76	13·76
Butter fat	5·23	
3 per cent. is the fat standard		
Add or deduct 1) per cent. for every 1 per cent. above or below—consequently add		22·55
Time since calving	123 days.	
Add one point for every 10 days		12·3
Total		80.56

This seems a very fair way of testing an animal, only some account should be taken of how much and how rich food the cow eats.

THE LATEST AND BRIEFEST.

SPEAKING of the rude forms of butter-making practiced in some countries, Dr. Davenport states that in Brazil they fill a hide with milk, and it is tightly closed and then lustily shaken by an athletic native at either end, or it is dragged about upon the ground after a galloping horse until the butter comes. In Chili, the filled hide is placed upon a donkey's back, and he is trotted about until the butter comes. In Morocco, a filled goatskin is rolled about and kneeded by women until the same effect is produced .....

W. H. YEOMANS tried planting sunflowers, so that they might be used as bean poles. He says he will never try it again. It may pay to raise sunflowers for seed—we have seen them raised in the West for fuel—but no plant can serve two purposes without slighting one .....

A NUMBER of papers are discussing the question of soaking corn for feeding to stock. The general verdict seems to be that it will pay where a few head of stock are kept. Where one does business enough to warrant him in purchasing a corn mill, or where the regular mill is handy, soaking corn will probably be voted "too much bother." The smaller farmer, living at a distance from a mill, will find it profitable .....

THE Planter's Journal urges Southern farmers to sow more oats. At the Gulf coast, a crop can be harvested in June and be followed by a crop of peas with excellent results .....

A CORRESPONDENT of the Western Rural succeeds in keeping his flock of sheep in good health. By no means the least important of his appliances he counts a Winchester rifle, two good shot guns and a bottle of strychnine. The sheep live, but there is a frightful mortality among dogs at times .....

DR. HOSKINS says: "There are a good many men whose labor cannot be used to profit. They are called 'cheap hands,' but they are the dearest help a man can have" .....

A WRITER in the Philadelphia Ledger says that the correct name for hard times is "whisky and tobacco." .....

THE Gregg, as first reported by the RURAL, is *not* a hardy raspberry. But it is large, though of poorish quality .....

THE Cuthbert is, by general consent, the best of the red raspberries. It was first disseminated by the R. N.-Y in its free seed and plant distribution .....

THE white Ann Arbor Grape drops from the stem .....

Everywhere.

TRANSCONTINENTAL LETTERS.—XLVII.

ALASKAN SERIES.

MARY WAGER-FISHER.

Prince of Wales Island; Scowl's; Tongas; native missionaries; back to British Columbia; news of Grant's death; close of the Alaskan cruise; return to Seattle.

THE following morning—July 24—dawned clear and warm, with the ship at anchor off the coast of Prince of Wales Island in the Kassan Bay. Here were also lying the Pinta and the United States Survey ship, the Patterson, which we had met in Ward's Cove, on the upward cruise. Captain Nichols, commanding officer on the Pinta, told me that strawberries grew farther north, from Glacier Bay, up to Clickhat, and that at the latter place the Alpine berry is also found. But none of the many persons with whom I talked, had ever seen in any part of Alaska blackberries or raspberries growing in a wild state, such as grow in most parts of the United States. This officer also told me that the Prince of Wales Island is 180 miles long and 60 wide, in the extremest length and width: that it abounds in minerals—has gold, silver, copper, marble and good bituminous coal; how much, of course, is not yet known.

As the steamship was to lie at anchor at this point for the day—another fishing station—the captain took us all off in boats, drawn by a steam launch from the Patterson, to a point five or six miles away, called Scowl's House, where we found a charming picnic ground, and spent the day, hampers of provision having been brought from the ship in care of a number of waiters who spread the tables on the thick moss in the woods, where I found, for the first time, an orchid, growing in abundance, but past its first bloom and without leaves. About six miles further on was Scowl's Village, a Hyda settlement, which we were very desirous of visiting, but the captain deemed it too far away. Scowl was the Hyda chief who died last year, and whose imperial brother, blind Paul Jones, we had seen in Wrangell, in June. Whether the house near the picnic ground had been built by Scowl, was a matter of dispute. It is an uncommonly fine Indian house, large, well furnished, with modern kitchen furniture, and the four inside posts are carved in the finest totem style, while in front of the house rises a tall totem 50 feet high, perhaps, a very fine one. The top is crowned with the figure of a man with a hat on his head and with his hands resting on the shoulders of two other men below him, which indicates that the founder of the pole owned two slaves, according to the interpretation given to us by an Indian. The house was locked and quite unoccupied.

On our way back from the picnic, the party received an invitation to visit the Patterson, and spent some little time in peering about into the cozy quarters of this beautifully fitted up vessel. Senator Miller of California, with his wife and daughter, had been guests on the "Patterson" for some days, having left the "Ancon" on her upward cruise, and rejoined her at this point. Lieutenant Clover in command of the Patterson, is the fiancé of Miss Miller. That evening we again were in motion and next morning, early, stopped in Naha Bay to take on a passenger, and in the afternoon reached Tongas where we went on shore for two or three hours—having touched at this point in going up, in the nigh to take on a Custom House officer. The day was perfectly clear and "blazing hot" in the sun, and the one white woman we saw here was clad in a white gown trimmed with embroidery. Tongas consists of two or three houses, prettily located on a terrace above a very rocky beach, and considerably removed is an Indian settlement, with a population varying between three and four hundred in Winter: but with a few exceptions the Indians at this time were all away hunting and fishing. I noticed a number of well kept gardens here, the potatoes and peas being particularly fine, and in one I saw growing for the first time the cultivated red raspberry looking perfectly at home. It was a tiresome tramp along a narrow path beaten through bog and bush, to the Indian ranch, where we found quite a number of totem poles which the Indians seemed to be utilizing for monuments to the dead, nailing upon them legends, and even clothing. On the front of one house was an inscription in English to the memory of Ebbitts, chief of the Tongas tribe, who died last year at the age of 100 years. We were pleasantly entertained for a little time in the house of native missionaries, the woman having been trained in Mrs. McFarland's school at Wrangell. She told me that in Winter she had a school of 45 pupils, and that she was paid $500 a year by a Board of Missions. Both she and her husband were neat and well mannered, and both spoke English readily. They had a baby that lay quietly in a hammock. Around all the Indian houses are wolfish-looking dogs in abundance, but I rarely heard one bark, and I never had any cause for feeling in the least afraid of them.

Tongas was the last Alaskan port, and that evening we sailed on into the waters of British Columbia, passing through Queen Charlotte's Sound in the night, and next morning we were in the quiet water of Graham Reach, with its beautiful scenery. It was Sunday, and there were priests on board, both Protestant and Catholic; but the captain did not favor having any religious service, because of the diversity of sects among the passengers. We had a Sunday dinner and ice cream for one of the extras—made, presumably, of condensed milk, but quite good. On the following day we passed the Seymour Narrows about noon, and from morn until night we sailed as in the northward cruise, amid most enchanting scenes of mountains and isles. As the perfect evening came on, we reached Departure Bay, and the atmosphere was obscured by the smoke from forest fires. The ship halted only

long enough for the Captain to go on shore for a telegram from Portland, conveying instructions as to coaling, and the only words he said upon his return were: "Grant is dead," and the ship sped on her way toward Victoria, past Nanaimo, the red light of the setting sun shining on the pretty town through the smoky twilight with peculiar and striking effect.

The news of Gen. Grant's death reminded us of the fact that for nearly two months we had been without recent news of anything or anybody, without newspapers and beyond the reach of telegrams, and, all in all, it had been extremely enjoyable, although now that we were so near our native land, we had some apprehensions when thinking of what might have happened. Next morning we awoke in Victoria, hot and enveloped in smoke, and we regretted not having tarried longer in the pure, fresh air of Alaska. We remained in port here until nearly noon, when we steamed across the Strait to Port Townsend. All sailing craft were becalmed, as hardly a breath of air was stirring to cause a ripple, and in the haze they looked like ghosts of barks suspended in mid air.

At Port Townsend, we left the Ancon and our Alaskan cruise was ended. We had sailed June 6, and it was now the evening of July 28, and our cruise had covered about 2,500 miles of travel, the most enjoyable and charming water travel, unquestionably, in the whole world. It had been like one long picnic amid the grandest scenes, without the fatigue of cars, attended by no mishaps, and delightful from beginning to end. But after all I have written of our seeings, I am only too confident that the only way to form any just idea of Alaska is to go and see it for yourself! In a somewhat late number of the Coast Pilot 150 pages are filled with a list of the books, pamphlets, etc., that have been written in various languages concerning Alaska, and still so little is generally known of it. The best work on the flora of the country is by a Frenchman.

After an hour's wait at Port Townsend we went on board the Olympian for Seattle, and stopped on the way at Ports Ludlow and Gamble—towns on Puget Sound, which I had not hitherto seen—both the sites of large sawmills, and both very prettily located, with attractive well kept houses, which reminded me of small New England villages. At Ludlow I counted 25 houses—there were probably more — and Gamble is still larger. We had a very good dinner on board the steamer, and reached Seattle a little after eleven in the evening. It was quite like getting home, so many were the familiar faces we met, and so full of genial welcome the greetings we received.

SPECIAL SEED REPORTS.

Alabama.

CAMDEN, Wilcox Co., Dec. 10.—This county is about 100 miles north of the Gulf of Mexico, and is a good agricultural district. All farm, garden and orchard products do well; but as there are no fast freight facilities, nothing is raised for market, except cotton; that brings spot cash at any time. Crops were about an average. Health, good. Labor, cheap (negro). Very little meat, hogs having nearly all died the past Summer from cholera. Z. S. C.

Canada.

BEVERLY, Ont.—From the Rural seeds of 1884, I raised some of the finest tomatoes I ever ate, The D.—M. Wheat was nearly all winter-killed. I harvested about one pint and sowed it again this Fall. I thrashed twenty-six pounds of beautiful, large, white grain from the rye, and sowed it on one-half acre this Fall. I planted the corn and it ripened about three pecks of nice large ears. The flowers were extremely fine. The poppies in particular attracted much attention. X.

PICTON, Ont.—The Rural Beans were vigorous growers, prolific bearers and nice for use as shelled, but worthless as string beans. The King Humbert Tomatoes were perfectly worthless, although ripening perfectly. The round, smooth kind was very good, but not so good as Livingston's Favorite. Both kinds of peas failed on account of mildew, but I think if they could be made to succeed, they would be grand, for they had enormous pods. The Garden Treasures did not amount to anything, all failing to germinate. C. M. Y.

STIRLING, Ont.—I am much pleased with the Thousand-fold Rye. I had nearly half a bushel. I have sown it again, and it looks fine. I I think it worth the price of the paper. The peas did well, but the Market Garden is the most productive. The Johnson Grass never came up. The corn produces too much stalk, and is too late; the beans are not as good as what we have. The flowers are lovely. Success to the Rural! G. M.

Colorado.

MONTROSE, Montrose Co., Dec. 14.—The third crop raised in the Uncompahgre Valley has proven, beyond all doubt, that in the Ute Reservation there lies one of the finest farming districts in the United States. Almost every variety of small grain and grasses has been fully tested this season, and all have fully repaid the labor bestowed upon them. Corn has been raised in paying quantities wherever it was planted, while all vegetables have done well. At an impromptu fair lately held here, Eastern people who chanced to be present were heard to exclaim that they would not have believed it possible to produce such vegetables, had they not seen them. Potatoes weighing five or six pounds were not uncommon. One farmer produced 40 potatoes which weighed 108 pounds! The Prince of Wales and Carter's Stratagem Peas were planted side by side; all came up splendidly and both were so fine that I cannot decide which was the best. I saved one quart of each for seed, and we used the rest for the table. Each continued to bear until October 10, when they succumbed to the frost. Each grew about 24 to 28 inches high, and continued blooming and bearing without intermission, retaining their enormous well filled pods to the very last. The 50 crosses of corn failed to ripen. I had four other varieties, all of which glazed before frost, but not a single ear of the Rural corn matured. Every one of the Flageolet Beans came up and attained a hight of about six to eight feet; were very prolific, but I am at a loss to know what to do with them. As string beans, I found them worthless, and they are too small for shell beans. The tomatoes were small, but very smooth, solid and of fine flavor. The Johnson Grass was very slow in coming up, but finally it appeared and grew five to six feet high. I am afraid the seed did not fully mature before it was killed by the frost. I cut all the heads off, however, and will plant them another year. I hope it will stand the Winters here, as I am sure it will be a valuable crop. I. G. B.

Illinois.

CASTLETON, Stark Co., Dec. 16.—The Rural mixed corn has proved too late for this part of the world. The peas have done well, especially Cleveland's Rural New-Yorker. The tomatoes are splendid. The Johnson Grass has not yet made its appearance. A. W.

Kansas.

CLAY CENTER, Dec. 23, 1885.—The Rural seeds did very well. I saved all the peas and beans for seed. I had some very fine ears from the corn, which I saved for seed. Wheat here almost a total failure; the growing crop looks well. Corn will average about 35 bushels; oats, 40. Long life to the RURAL!

S. W. M.

Maryland.

WESTOVER, Somerset Co., Dec. 14.—Since the first of December, we have had much rain and some very cold spells. The ground at times has been frozen an inch deep, and our rivers, which are to some extent salt, have been covered from shore to shore with a thin coating of ice where they are a full mile in width. Truckers have finished plowing their land; but more or less land for corn or oats will be plowed during the Winter. It is very seldom that frost interferes with winter plowing with us; but on most of our soils, it is often too wet. Merchandise and farm products are hard to move, and prices are low. Corn, 40 cents; wheat, 90 cents to 98 cents; oats, 30 cents; pork, dressed, 4 cents to 6 cents; eggs, 23 cents; butter, 25 to 30 cents. Very little good butter is made in this section, and strictly choice finds a very ready market at a fair price. S. C. S.

Michigan.

ONEKAMA, Dec. 6, 1885.—Both varieties of peas, as well as the beans, did well. I saved all for seed. The Johnson Grass grew about two feet high and seeded. I expect to see it again in the Spring. Some of the corn is too late so far north. The Garden Treasures gave us a variety of flowers all Summer. W. K.

New Jersey.

TRENTON, Mercer Co.—The Prince of Wales Peas were very fine, vigorous, handsome growers, pods unusually long and well-filled. The Flageolet Beans were exceptionally fine. I have kept all the peas and beans for seed. The 50 crosses of corn developed some ears perfect in all respects except length. This will perhaps come with continued planting in this locality. I expect to exhibit some of it at the next meeting of State horticultural and agricultural societies. The flowers were fine. F. D.

New York.

HORNELLSVILLE, Steuben Co., Dec. 10.—Farmers are harvesting fodder, tightening barns, and banking cellars. Hay a light crop, and of about average quality; price high for all grades, ranging from $12 to $18, in bulk. Corn fodder good and raised in large quantities by stockmen, owing to an early indication of failure in old meadows. Winter wheat is badly winter-killed, and in some cases injured by weevil and Hessian fly; hence crop light, but quality generally good. Spring wheat, especially White Russian, a very large yield, but acreage limited. Oats, acreage full; growth light and short; fairly filled, but grain small. The crop on whole districts was destroyed by hail after heading. Barley earlier than oats, hence better in all points; acreage, average. Corn good; yield and acreage full. Potatoes very large acreage; yield of early crop light, that of late the heaviest for years, but they have decayed badly. In many sections from one-third to one-half is unfit at digging, and they continue to decay when dug. Dealers refuse to handle them at any price except in limited quantities, hence many are stored by farmers. Queens, Snowflakes and Late Rose have rotted worst. The Rural Blush, White Star, White Elephant, Burbank, and Adirondack are most in favor for general culture, being freest from rot and blight. The present stand of winter-wheat is looking good, the Fall having been favorable for growth, and it is well covered with snow enough to prevent frost killing. Apples very plentiful and correspondingly cheap. But little is done in Fall plowing because there were too many potatoes to dig and market between rain storms. All kinds of stock are going into winter-quarters in fine condition. Milk stock in fair demand; beef and store cattle low. Sheep are abundant and there are scarcely any sales for store stock, and the market is only a little better for mutton grades. C. J. P.

Pennsylvania.

MURRAYSVILLE, Westmoreland Co.—We harvested five pounds seven ounces of the Diehl-Mediterranean Wheat from about 100 stalks the hens left me. The Thousand-fold Rye produced seven pounds nine ounces, and was well thought of by all who saw it. The Stratagem Peas did not come up well, but they bore large pods. I had a pint for seed. The Flageolet Bean was very productive. I have about four quarts. Sorghum Halapense did not come up very well; only a few seed ripened. The King Humbert Tomato was very productive, but those sent in '83 were much better. The cross-bred corn produced heavy stalks 11 to 12 feet high, but did not turn out good. One stalk of white flint had six ears, which, laid end to end, measured three feet eight-and-a-half inches. The Garden Treasures were treasures indeed. Thousands of bushels of apples sold around here for 10 cents to 12 cents per bushel; other things in proportion. E. J. L.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time.]

FERTILIZER QUERIES.

H. C. S., Lebanon, Pa.—1. What is the difference in effect of using upon small fruits, between a ton of ground bone and a ton of dissolved bone, supposing each to cost the same? 2. What is gained or lost by using the dissolved bone? 3. What effect has the sulphuric acid, used in dissolving the bones, on the growth of the crop? 4. How much less actual fertilizing matter has a ton of dissolved bones, if any?

ANS.—1. Much depends upon how fine the bone has been ground and upon the condition of the soil to which it is applied. The bone could be reduced sufficiently fine so that the plant would be enabled, by the aid of its living organism and the assistance of the soil, to take up and use what it needs for growth. But if of the fineness of mustard seed up to the size of grains of corn, the plant could get but little nutriment from it until it had rotted or decayed in the soil. In some soils also there is more humus than in others, the acid of which would aid in rapidly decomposing the bone. 2. By using dissolved bone, greater solubility and quicker action are gained. About half the manurial elements are lost, or, in other words, replaced by other and non-manurial substances. 3. Probably none, or, at most, one scarcely appreciable. 4. As nearly as may be one-half. In making the best grades of dissolved bone, to 1,000 pounds of bone are added 800 pounds of sulphuric acid and 400 pounds of water, but in the process of dissolving about 200 pounds of water evaporate, leaving one ton, so that where a ton of bone contains about 50 per cent. of tricalcic or three-lime phosphate of lime, containing about 25 per cent. of phosphoric acid, but in an insoluble form, and hence unavailable as plant food, the dissolved bone contains only 12 per cent. of phosphoric acid in a soluble form, and 25 per cent. of gypsum or sulphate of lime, formed by a union of the lime that was united with the phosphoric acid in the bone, but which was wrenched from that union by its greater affinity for the sulphuric acid.

KEEPING SHEEP WITHIN MOVABLE HURDLES.

C. L. Y., Orient, N. Y.—1. How are sheep kept in hurdles upon green crops as in England? 2. Would not the Rural Branching Sorghum, in connection with oats and peas, be good for so keeping sheep? 3. How many ewes with their lambs could I keep and fatten per acre, our market being in July and August?

ANS.—1. The hurdles are simply movable fences, made after various forms and in pannels, so that they can be easily moved. It is not easy to describe any of the fences used without drawings; but any convenient form of our numerous portable fences may be used. A small part of the field is fenced off, and into this the sheep are turned, and when the grass has been well eaten down the hurdles are moved so as to inclose another part, and so on, inclosing a new piece every time the old one is eaten down. 2. Peas and oats are sometimes used; the Branching Sorghum would get too high and coarse before the field was eaten down. In England most of the hurdle feeding is done in the Fall, and rape, colza and turnips are much used. 3. For spring hurdle feeding no crop would be superior to Red Clover, and possibly winter rye for very early use. We could not guess how many could be fed without knowing what crop was to be fed, and how rich the land is, in fact, all the data. It would also make a great difference whether grain was fed, how much and of what kind. There is a way of feeding in which about six sheep and lambs are confined in a movable pen 16 feet long and five feet wide, and so made that the sheep can put their heads through the sides to eat. The pen is moved twice daily close up to the grass or crop to be eaten off; the sheep reaching through, eating everything clean as far as they can reach, when the pen is again moved to the uneaten food. When so fed off and with seasonable rains, the clover will grow so rapidly as to be ready for again feeding over in about three weeks, and many more sheep may be kept per acre.

DEEP PLOWING; TREATMENT OF AN ORCHARD.

W. W. F., Waterville, Ohio.—1. My land is a sandy loam running from a black, sandy loam with a clay subsoil within from six to 12 inches of the surface and quite level, to light, sand on the surface and a golden yellow subsoil from 6 to 12 inches below. It was originally quite fertile, especially the lower lands, and is never wet except in the lowest places, and yet it is never very dry even in the driest time. I use considerable manure and grow small fruits; how deep should it be plowed? 2. I planted an orchard of pears and cherries five years ago in alternate rows, and a year later I planted currants among them. The trees made a large growth for the first two or three years, but since then they have not done as well, though they grow fairly. They are headed low and it is quite difficult to cultivate; how shall I manage this piece to the best advantage?

ANS.—1. It is difficult and unsafe to give specific directions, on such scanty data. It is only safe to say, in a general way, never change from shallow to deep plowing suddenly. It is entirely safe to plow each year a quarter or half inch deeper than the year before, using sufficient manure to keep up the quality of the soil. In most localities a deep soil is better than one less deep, but this is not always the case. When the soil is too sandy and overlying a clay subsoil, it nearly always improves the soil to work a little clay up into the soil, doing it gradually. We should say try plowing small plots at different depths, and watch the result. 2. Under no circumstances should you seed to grass; but you have not mentioned how far the trees are apart, and without knowing this, we cannot advise as to the course to pursue. But don't forget that you have virtually three crops growing on the land at one time, and unless you feed high some of them must suffer. The orchard should have potash, phosphoric acid and nitrogen, particularly the former two, and put on any manure that gives them in the most available form for the least money. We should say imperatively either keep it well cultivated or remove a part of the plants or trees; and the easiest way to keep it clean, is to *keep it clean*—not half way.

ABOUT STRAWBERRIES.

A. W. W., Salisbury.—1. What is the best kind of manure for strawberries, and when and how should it be applied? 2. I grew strawberries for four years in succession on a piece of ground, and then planted it to corn and again re-set the strawberries; but they have never done well since; what is the trouble? 3. Wilson Strawberries do not succeed here now; Crescents do the best of any; is there any thing better?

ANS.—1. Well rotted barn-yard manure made from grain-fed cattle is first-rate for most soils. All sandy soils are greatly benefited by an application of hard-wood ashes, or

potash in some form. Muriate of potash is good where ashes cannot be got in abundance. Strawberries also need bone dust or superphosphate on such land. We think the land is deficient in potash and probably phosphoric acid, and would recommend 400 pounds of bone flour or 600 pounds of a good brand of superphosphate and 40 bushels of unleached hardwood ashes per acre, and 10 to 20 loads of good barn-yard manure. We think strawberries would then grow again better than ever. 2. Crescent Seedling is a very good berry, and very profitable in many places. We advise trying the Jewell in a small way. If you send us three or four subscribers you will get 24, or 32 plants. It does well on sandy land, and the ground for it may be rich.

FERTILIZING AN ORCHARD; WAR ON THE CUT-WORM.

C. B. W., Douglas, Mich.—1. Is salt or lime beneficial to a peach orchard; if so, how much, and how should it be applied? 2. Can salt or lime be used in a peach orchard to destroy cut-worms, and, if so, how much? My orchard is from one to eight years old, on hemlock, sandy land, with a clay subsoil, a little rolling and well drained. The cut-worms are so very thick that they sometimes destroy trees three years old.

ANS.—1. Very likely lime would be beneficial on such land, and a moderate amount of salt would do no harm; but we should much prefer to apply a liberal amount of deciduous wood ashes and bone dust. The ashes could be bought in the hard-wood districts of Northern Michigan for from five to six cents per bushel, and they contain about three pounds of potash to the bushel. The bone dust can be bought in Chicago and freighted across the lake. Try these in varying quantities and also try them in connection with lime and salt, marking the plots, and making memoranda of the applications, and watch the results. A single year will give much light. If the ashes cannot be obtained, kainit or muriate of potash may be substituted to give the needed potash. With either of these, especially the kainit, no salt would be used, as a large share of this is in the kainit. 2. It is not possible to use enough salt (lime would do no good) to kill the cut-worms without also killing the trees. We suppose the climbing cut-worm is meant, and we suggest the extermination of these by spraying the trees, just at night, with a solution of Paris-green or London-purple, using care to cover all the lower buds and leaves, as these are first eaten. We also suggest the spreading of sheets under the trees after dark (as they work entirely in the night) and the jarring of the worms off the trees upon the sheets where they can be easily caught and killed. The sheets should be used the same as for the curculio.

ABOUT ASHES.

G. R., Colfax, W. T.—1. Have ashes from a burnt straw-stack sufficient manurial value to pay for the trouble of applying them to small fruits? 2. Are Lombardy Poplar, Cottonwood, Balm-of-Gilead, Willow and Box Elder classed with hard-wood trees? 3. What are the relative values of ashes from the above and other deciduous trees?

ANS.—1. If saved and applied without wetting, they certainly have. 2. We think the Box Elder is; the others are not. 3. We often speak of hard-wood ashes when we should say that of deciduous trees. The White or Swamp Elm is by no means a hard wood, and still it makes ashes of the highest value, containing more potash than almost any other. We think the varieties of woods mentioned make but comparatively few ashes, and these, though not rich in potash, are worth using where handy.

ROOTS FOR MILK.

C. L., Chatham, N. J.—I notice you quote in the RURAL from Sir J. B. Lawes wherein he speaks very disparagingly of roots, and especially of mangels, as a food for milk-producing cows. Now I have always noticed a gain of milk whenever I have fed turnips, and I had been led to believe Dr. Lawes was an advocate of roots as a valuable portion of stock food? I would like to know what you think of them, as I was expecting to plant them largely next season, but don't care to do so if they are worthless?

ANS—We should not advise any one to use turnips, mangels, or any other root, as the bulk of a cow's feed, and that is just the position which, we understand, Dr. Lawes occupies. At the same time, the cows should have a daily ration of some succulent food to produce the best results in giving milk. No doubt carrots are the best roots for cow feeding for milk or butter; but mangels are nearly as good, and it does not cost one-third as much to raise and put them in a pit or cellar.

MALT SPROUTS AS FOOD.

W. H. W., Crawford, Ind.—What are "malt sprouts" worth as cattle food?

ANS.—Malt sprouts, which are the growing germs broken off, in drying, from the sprouted barley that is malted, have a very high feeding value, chemically, containing 22.95 per cent. of albuminoids, 1.79 per cent. of fat, and 48.6 per cent. of carbohydrates. This makes them worth about two-thirds as much as new-process oil meal. But in our experience, stock do not relish them nearly as well, and although they can be bought for one-half the price of the new-process meal, we much prefer the latter; still the sprouts are good to mix with corn meal and bran, or to feed with straw or Timothy hay.

FEED FOR MILCH COWS.

J. H. W., Richards, Ohio.—1. Which is best for milch cows, rye, buckwheat or wheat bran? 2. Should it be fed dry or wet? 3. What is the name of a reliable New York cattle merchant?

ANS.—1. They are all good foods mixed with corn meal and oil meal. There is considerable difference of opinion as to their comparative values. We think, however, that they range in the order of buckwheat, wheat and rye, with not very much difference. 2. If fed to animals having plenty of roots, silage or other succulent food, it may well be fed dry; but if fed with dry hay and straw, we should by all means want it wet up, and it would be much better if mixed with hot water in the morning for night feeding, and at night for morning feeding. 3. Hunne & Mullen; J F. Sadler & Co.; Newton & Gillet; M. Goldsmith; D. Waisel, and Hallenbeck & Davis are all good men. A letter addressed to any of them at the stock yard will reach them.

FEED FOR MILK.

W. B. T., Round Knob, N. C.—1. I am keeping cows for milk, and can get peas, meal and wheat bran; how much of each ought I to feed each cow at a time, when fed twice daily? 2. Would it not be better to cook the peas?

ANS.—1. We cannot give a very good answer without knowing the price of each, and just whether real peas are meant or cow-peas, which are not peas at all. We would say, in a general way, mix the three ingredients in equal parts by weight, which will give as much bulk of bran as of both the others, and then feed enough to keep the cows up in flesh or gaining a little. No one can say how much any given cow should have; even her attendant should be constantly on the watch so as to give the exact quantity. 2. The peas would be much better if ground; but if it is not convenient to grind them, they will be improved by cooking, but after cooking they must not be allowed to become sour before they are eaten.

Miscellaneous.

B. C. W., Rahway, N. J.—1. Are the skins of boiled potatoes harmful to fowls? 2. I have built a hen house four feet high at the rear, and six feet high at the front, the rooms being 6x7 feet each. For ventilation, I have put into each room in one corner, a box 4x6 inches inside, running from near the ground inside, up through and out at the top; will that afford sufficient ventilation for 10 fowls? 3. Will a cement floor covered with dirt be bad for the fowls?

ANS.—1. There is no better winter food for fowls than warm, boiled potatoes, and the skins will not do the least harm. Feed them daily. 2. The rooms are large enough for that number of fowls, and your system of ventilation is simply perfect for Winter; for Summer, the tube should have an opening near the roof. It is a serious mistake often made to have the ventilator for winter use open from the upper part of the room. When running to the bottom and opening near it, as in your case, the bad air is taken out without much heat. 3. No floor could be better; only change the dirt often, say once a week or month at furthest.

E. A. Aberdeen, Dak.—1. What proportion of barley can I use with one part of oil meal and three parts of bran? No corn is raised here, and barley is worth from thirty-five to fifty cents. 2. What is the best way to kill wild mustard? Pulling is rather hard work. 3. At what season is it best to emasculate pigs?

ANS.—1. You can use almost any proportion you please, but how much to mix in profitably, depends upon the relative prices. Barley meal is a good feed of itself; but it would be improved by a mixture of bran and oil meal. Without knowing the prices, we should say, add at least four parts of barley meal to the others. 2. If the land could be plowed when the mustard is in full bloom, it would do very much towards clearing the fields, where very much filled; but, after all, there is no way to get it out and keep it out, except by use of the fingers in pulling it. 3. We think the pigs should be castrated when about three or four weeks old, unless in very cold weather, when they are obliged to be out in the cold and storms. In that case, let them run till warm weather in Spring; it is hardly advisable to keep pigs without providing them with warm sleeping quarters at least.

W. A. C., Wyoming, Iowa.—Is the Kilborne or Canada Iron-clad Peach all that is claimed for it, and will it stand the Winters of Iowa?

ANS.—The "House Peach," later called the "Kilborne," or Canada Iron-clad, was raised by Mr. J. S. House, of Beamsville, Canada, and by him given to Mr. Kilborne, of that place, and by them both, buds were given away to the neighbors. In all respects it is like the Hale's Early, except it may be a little longer from the stem to the blossom end. It is no hardier or more prolific in bearing than the Hale, and you could just as reasonably expect it to withstand the Iowa climate as the Hale or other peaches of that class. Mr. House says it was a seedling of a seedling, the parentage of which he did not know.

"Subscriber," South Bend, Ind.—1. What is the best time to prune grape-vines? 2. What does the RURAL think of mulching small fruits, grapes and shrubbery for winter protection? 3. Should grape-vines be laid down and covered?

ANS.—1. We prune our vines as soon as the leaves fall? 2. There is no doubt that strawberries are benefited by mulching. We say this from a long experience, during which we have tried both ways, *i. e.*, mulching and not mulching. We approve of mulching the soil around trees and shrubbery. 3. Unless the grape-vines are tender, we should not go to the trouble of laying them.

T. C. Atkinson, Wis.—I received some pumpkin seed from a friend in Vt., the pumpkins were of a good size, very warty and of a green color when ripe; not very thick-meated but of fine grain and good quality. One plant bore fruit of a dark-green color, round shape, smooth surface, but a little ribbed near the stem, and hard-shelled; very fine-grained, with lumps in the flesh, and of good quality; what kind were they?

ANS.—From the description, and without seeing them or the seeds, we should say they were either some variety of squash or a cross between the same and a pumpkin.

R. J. L., Hannibal, N. Y.—What is the best method of keeping parsnips over Winter?

ANS.—If not wanted until Spring, the best method is to allow them to remain in the ground, as freezing does them no harm. If wanted for use during the Winter, they should be dug and put in a cold cellar or buried; in either case they should be mixed with dirt and kept very near the freezing point. They grow with very little heat and become pithy and unfit for eating or feeding.

S. C. S., Westorer, Md.—Are certain kinds of deciduous and evergreen trees injuriously affected by salt air, or by being planted near salt water streams or bodies of salt water, and if so, what varieties are most affected?

ANS.—We are not aware that any trees are harmed by salt air. The strong winds and sandy soil near the coast are often harmful to trees.

S. H., Hartley, Del.—To what family do the numerous persimmons growing hereabouts belong, and would they do as stocks for choice persimmon cions?

ANS.—Persimmons belong to the natural order Ebenaceæ or Ebonads. The generic name is Diospyros. They may serve as stocks for any variety of persimmons.

W. A. E., Sterling, Kans.—How are walnuts prepared for planting, and how early in the Spring should they be put in?

ANS.—As early in the Spring as the soil can be worked. The walnuts must be kept from becoming dry. They may be kept in the cellar, or buried in sand, a layer of sand and one of nuts; better the latter, and keep them where they will freeze.

Subscriber, Muncie, Ind.—What is the best book on the cultivation of lilies?

ANS.—Notes on Lilies, by Dr. Wallace, of Colchester, England. It may be had of Hallock & Thorp, Queens, N. Y., or of most prominent seedsmen.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, DECEMBER 26, 1885.

BAKER'S

Breakfast Cocoa.

Warranted *absolutely pure Cocoa*, from which the excess of Oil has been removed. It has *three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup*. It is delicious, nourishing, strengthening, easily digested, and admirably adapted for invalids as well as for persons in health.

Sold by Grocers everywhere.

W. BAKER & CO., Dorchester, Mass.

Use the boss Zinc and Leather Interfering Boots and Collar Pads. They are the best.

THE LINE SELECTED BY THE U. S. GOV'T TO CARRY THE FAST MAIL.

Burlington Route

C.B.&Q.R.R.

It is the only line with its own track from

CHICAGO TO DENVER,

Either by way of Omaha, Pacific Junc., St. Joseph, Atchison or Kansas City.

It connects in Union Depots with through trains from NEW YORK, PHILADELPHIA, BOSTON and all Eastern points. It is the principal line to

SAN FRANCISCO, PORTLAND & CITY OF MEXICO

It traverses all of the six great States of ILLINOIS, IOWA, MISSOURI, NEBRASKA, KANSAS, COLORADO with branch lines to all their important cities and towns.

From CHICAGO, PEORIA or ST. LOUIS, it runs every day in the year from one to three elegantly equipped through trains over its own tracks between

Chicago and Denver,
Chicago and Omaha,
Chicago and Council Bluffs,
Chicago and St. Joseph,
Chicago and Atchison,
Chicago and Kansas City,
Chicago and Topeka,
Chicago and Cedar Rapids,
Chicago and Sioux City,
Peoria and Council Bluffs,
Peoria and Kansas City,
St. Louis and Omaha,
St. Louis and St. Paul,
Kansas City and Denver,
Kansas City and St. Paul,
Kansas City and Omaha,

For all points in Northwest, West and Southwest.

Its equipment is complete and first class in every particular, and at all important points interlocking Switches and Signals are used, thus insuring comfort and safety.

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JANUARY 2, 1886.

WE beg so say, with many thanks to the friends who have aided the work, that we have now all the copy needed for our Potato Special, to be dated January 16.

AT this date, the Golden Pinus Massoniana is the showiest plant at the Rural Grounds. It is as golden as a sun ray. This charming pine has, we dare say, a golden future.

Prof. W. W. TRACY, the superintendent of D. M. Ferry & Co.'s experiment grounds (Detroit Mich.), writes, under date of December 17. "The 60 samples of potatoes planted on our trial grounds, essentially by the Rural's trench-mulch system, yielded at the rate of from 200 to 800 bushels per acre."

As a matter of pleasure rather than profit we recommend our friends next season to try raising tomatoes trained to poles. Let the poles, 12 feet high, be set securely in the soil. As the tomato plant grows, pinch out all lateral shoots, confining it to a single stem and securing it loosely by loops to the poles as needed. By Autumn the plant will have reached the top of the pole, bearing an amount of fine fruit, which will surprise those who have not tried this simple way of raising the tomato.

UNDER date of December 2, Sir J. B. Lawes writes us: "When I saw the answers to your various questions" (reference is made to the RURAL'S Fertilizer Special.—Eds. R. N.-Y.), "I was very glad that I did not add to the confusion by sending you an article. The action of manures in your country appears to be governed by chance. Here, as a rule, they act more regularly, and in cases, where they fail, it is generally possible to find out the reason for the failure."

A NOTE FROM SIR J. B. LAWES.—EDS. RURAL NEW-YORKER: I shall have much pleasure in complying with your request that I should occasionally contribute articles to your paper during the coming year. I never write merely for the sake of writing, but because I have something to say which I think may be of some service to those engaged in agriculture.

Rothamsted, Eng., Dec. 10.

ALL who subscribe for the RURAL, and of course, our regular subscribers, are entitled to the RURAL'S Free Seed Distribution upon *application*. Others need not apply. A two-cent stamp should accompany the simple request "Send Seeds." We trust that those who do not care enough for the seeds to plant and give them good care and report to the RURAL how they succeed, will not apply. Our stock is necessarily limited, and the seeds are too valuable to be thrown away. The object of these seed distributions is to enable our subscribers to test in a small way the latest and most promising novelties without incurring any expense.

A POINT of pomological lore that can not be learned from any source but observation, is the behavior of special sorts of fruit in any given locality. They are so nice in their requirements, and differ in these so greatly, that a sort which attains high excellence and abundant fruitage in a section of soil or exposure, may be quite inferior and unremunerative in places near-by. This is becoming generally known, and already we find not only plantations of sorts of fruits, but of other crops, as onions, celery, etc., clustering around any spot on which they have shown themselves at their best. Those who test new varieties in any locality do a most useful public service, and intending planters should study well all growths and yields in their vicinity, and be guided by their own observations in selecting.

MEECH'S (?) PROLIFIC QUINCE.

MR. MEECH has issued a pamphlet entitled a "*Reply to an attack on the Meech's Prolific Quince by the Rural New-Yorker Nov.* 7, 1885." The attack referred to is the following, which appeared in the RURAL of the above date:

"The judges on fruit at the Mt. Holly Fair (N. J.) after a close and careful comparison of the Champion and the so-called Meech's Prolific Quince, were of the *unanimous* opinion that there was not the least difference whatever between them. The putting out of an old variety under a new name cannot be too quickly censured; and it seems now to be clearly settled that this is an instance in point."

We should think that the attack was made by the judges of the Mt. Holly Fair rather than by the R. N.-Y. Little need be said in reply. The question is this: Is Meech's Prolific a distinct variety? If so, is it a seedling produced by Mr. Meech? We would not, knowingly, do Mr. Meech or anybody else any unjustice whatever. Did you raise this quince from seed, Mr. Meech? If you did not, why do you give it a name which implies that you did? If you did not, who did? Let us settle this first.

The pamphlet further on says that the R. N.-Y., a few year ago, decided that the Champion was identical with the Angers. This is a mistake on Mr. Meech's part. We were *informed* that such was a fact by an experienced quince grower, and when it was found to be otherwise, the correction was promptly made in these columns. The only "positive" statement we have made in regard to the Champion is that it "bears early, but that it is too late for the Rural Ex. Grounds."

A WORD TO STRANGER FRIENDS.

WE are now sending thousands of copies of the RURAL NEW-YORKER each week to those who have asked to see it that they may become acquainted with it. We have been told by our contemporaries that only dead beats and those who wished to get something for nothing would apply. This we believe to be a slander on those who follow the most honest and honorable calling man ever pursued. We believe that all who have sent for it have done so in the utmost good faith, and with the intention, if satisfactory, of becoming subscribers. We find many in full sympathy with its honest, practical course, and we believe a large proportion will at least try it for a year.

We ask all who do like it and who become subscribers, to mention the fact when sending their subscriptions, as we wish to preserve such a list to be able to refute, by positive proof, the slanderous imputation upon those who sustain and feed the nation. We also ask all those who are pleased with it and think it worthy of the patronage of progressive farmers, to assist in extending its circulation by organizing clubs in their neighborhoods. Please send to us for posters and premium lists, and as many specimen copies as you think you can profitably use. We know that the longer you read the RURAL the better it will please you.

Dear stranger friends, we cordially invite you to join our ranks and help the RURAL NEW-YORKER on to a success worthy of its ability and honest purposes.

THE REGISTRATION BURDEN.

IT seems as though the thorough-bred stock breeders' associations are losing sight of the main objects to be secured by registration, and are cutting their own throats by charging such outrageous fees for registry. Each seems determined to excel the others in the amount fixed, as though the chief end and aim of the association, was to make money out of the registration and we fear the result will be only disastrous to the best interests of the best breeds. The central leading idea of registration as it seems to us, is to provide some means whereby a purchaser may be able to trace an animal back to its ancestry and be reasonably sure of its purity. It is well known that no thoroughbred animal is worth its hundreds or thousands of dollars as a mere meat, milk or butter producer. Its chief value comes from the power of imparting one or more of those qualities to its offspring, and to do this it must be pure-bred, and the registry is for the purpose of showing this purity.

The members of these associations largely breed such animals for sale, and if such sales are to be made only to the members, they will be very limited indeed, and the business would soon be overdone and unprofitable. The more such stock can be scattered among cattle men for crossing purposes, the more money there will be in it. Few farmers and men of ordinary means will buy thoroughbred stock and breed it in a small way, when they are compelled to pay from $25 to $100 for the registry of its progeny and no matter how good, without such registry they cannot sell it for more than its value for beef or butter production.

Such a course is at once unwise, arbitrary and unjust, while it is no barrier to improper or dishonest registration. Let the fee be placed at the lowest point paying expenses; watch the applicants with vigilance, and then make your money out of the excellence of the breed and the sale of stock! Don't let us have an onerous registration monopoly, on top, of all the rest!

SHALL FRAUD RULE THE LAND?

IT seems to us that there is a broad ground of self-interest on which the farmers who make, and the consumers, who desire to use genuine butter should stand together. The attitude assumed by the "bogus butter" makers at Chicago, shows clearly that they care nothing for law or public opinion; that they are united and have determined to use any amount of money in the courts, if necessary, in the defence of their unhallowed deception and fraud. They boldly declared that they made an article much better than large amounts of genuine butter, and that they were not going to be deprived of the privilege of selling it in any market they chose, and under any name they cared to adopt, saying, in so many words, "The makers of pure butter have no patent on the English language, and we have a right to brand our product as we please."

Now, conceding their claim that oleomargarine, when properly made, is not unwholesome and that it may be superior to poor butter, it is still true that nine-tenths of the stuff is not so "properly made," and that one pound in one hundred is never sold under its true name. The very act of offering and selling it as butter is a fraud, and robs both the farmers and consumers, the former by competition with genuine butter, thus reducing its price, and by creating a distrust of all butter and consequently reducing consumption; the latter by charging them two or three prices for an inferior article. The compelling of the manufacturers to put it into distinctive packages, branded with its true name, does not offer a cure to the evil, because nine-tenths of it is removed from the package before sale, and when so removed it is difficult to distinguish it from genuine butter.

We urge national legislation in this matter. Let us have a law appointing inspectors who shall have supervision of the manufactories, and let the makers be compelled to give it a uniform and distinctive color, and then let the manufacturers have the markets all to themselves. If they really can make an article superior to butter, they should be able to create a demand for it even when easily known by its appearance, and certainly the people whom they teach to prefer it, should be protected from being imposed upon by the substitution of poor butter. There is, then, no injustice in compelling it to be so colored as to be easily known, and this offers an easy solution of the difficulty. Let us then unite, both farmers and consumers, in agitating the matter and demanding of Congress immediate action. Let us have a distinct oleomargarine color, and we suggest a pale green as the most appropriate.

THE RURAL'S
Special Contributors
For 1886.

With a Revised List of the Subjects to be Considered.

(ENGLAND.)

SIR J. B. LAWES.
Subjects not as yet decided upon.

PROFESSOR J. P. SHELDON.
Dairy and Stock Notes.

JAMES SINCLAIR.
General English Farm Notes.

(UNITED STATES.)

PROFESSOR G. E. MORROW, ILLINOIS.

1. A series of short articles on The Principles of Breeding and Improvement of Animals, with Descriptions of Breeds and their Adaptations.
2. Notes on Live Stock in general.

GEN. CASSIUS M. CLAY, KENTUCKY.
How Live Stock may be Improved.

GEN. W. H. NOBLE, CONNECTICUT.
Rural Adornments and Comforts.

PROF. THOMAS MEEHAN, PENNS'A.
The Relation which Water bears to Successful Culture.

MAJOR HENRY E. ALVORD, Houghton Farm, NEW YORK.

1. A Noteworthy Change in Public Opinion regarding the Bureau of Animal Industry.
2. The Prospective Increase in the Factory System of Dairying, as the Result of Competition from Substitutes for Butter.

C. A. GREEN, NEW YORK.
Improving a Run-down Farm. (Continued.

WILLIAM FALCONER, LONG ISLAND, NEW YORK.

1. The Flower Garden.
2. Ornamental Trees and Shrubs.
3. The Window Garden.

A series of articles on Matters connected with Beef Cattle, and Beef Making.

Prof. W. W. TRACY, MICHIGAN.
A series of articles on the Testing, Introducing, naming and describing of Varieties of Vegetables.

PROF. E. M. SHELTON, Kansas.
Subjects not yet decided upon.

IN GENERAL
we may say that all of the RURAL'S regular contributors will continue with us during the year.

BREVITIES.

THE best grape vine? That is a question.

THE best strawberry: Jewell (?)

THE best wheat: Diehl-Mediterranean (?)

THE best oats: White Australian (?)

TRY the Earhart Everbearing Black-cap.

TRY the Golden Queen Raspberry.

TRY the Alaska Pea for the earliest.

PLANT a tree of the Frederick Clapp Pear.

PLANT a tree of the Prunus Pissardii if you admire purple leaves during the entire Summer.

YOUNG people—let botany be one of your studies for the new year.

PROF. J. L. BUDD, of the Iowa Agricultural College writes: "The RURAL is doing a grand work."

SUBSCRIBE for the R. N.-Y. if you are a progressive farmer and are not "penny-wise and pound foolish."

MONEY sent in letters for subscriptions to the RURAL NEW-YORKER is at the sender's risk. Our terms are invariably $2.00 a year in advance.

PROF. J. W. SANBORN, of the Missouri Agricultural College, under date of December 14, says; "The RURAL for energy and breadth holds a very high place in my estimation, and is worthy of your pride."

THE price of Cole's Improved Garden Plow complete with scuffles is $5.80 instead of $5.00, as stated in our premium list. Notwithstanding the difference in price is against us, we shall continue to send it for five subscribers, as announced.

IT is often said that to be well gloved and well shod are two prime conditions of dress. Similarly it may be said of a dwelling, that to have a neat front yard, and neat, smooth roadway are two indispensables to its good appearance. But we often see this truth overlooked even by people who have gone to great expense with the house itself. All good effect is spoiled by a habit of letting litter lie about the yard, or throwing it into the street where it is a nuisance, and a public notification of the character of the people living in the house.

The Herdsman.

A FINE HEIFER.

THE animal shown at Fig. 10 is said, by the London Live Stock Journal, to be one of the best living representatives of the Hereford breed, being almost perfect in every point. She is two years old and is owned by Mr. H. W. Taylor, England. She has been remarkably successful in the show yard, having taken many first prizes, notably one at Monmouth, where she won the champion prize as the best cow or heifer on exhibition.

Indust'l Societies.

CONVENTION OF THE ILLINOIS STATE HORTICULTURAL SOCIETY.

(RURAL SPECIAL REPORT.)

THE Illinois State Horticultural Society held its thirtieth annual meeting on Dec. 8th, 9th and 10th, and in point of interest, attendance and display, it was one of the most important of the association's gatherings. The following varieties of vegetables were recommended by the association for Illinois farmers: spinach, lettuce, radish, onions, beets, peas, beans, cabbage, parsnips, turnips, Irish and sweet potatoes, squash, cucumbers, melons, sweet corn, asparagus and rhubarb.

Dr. H. Shroeder, of Bloomington, introduced and recommended the planting of willow. He showed that the product of an acre would be from four to eight tons, which would sell for $25 to $30 per ton.

In view of the failures of the past 10 years, the association decided that the best 10 varieties of apple trees, out of a total of 1,000 trees, are as follows: Red Astrachan, 25; Stanard, 10; Maiden's Blush, 10; Ramsdell's Sweet, 10; Jonathan, 20; Rome Beauty, 20; Winesap, 10; Minkler, 20; Ben Davis, 475; Willow Twig, 400. It was decided to be unprofitable to raise more than two crops of strawberries from one planting. The fruit display of the association was the finest ever made, there being over 300 varieties of apples. It was the general opinion that the exhibit far surpassed those of New Orleans and the Illinois State Fair.

The next annual meeting of the association will be held at Jacksonville. "SUBSCRIBER."

The Poultry Yard.

HEN ROOST.

WE show, at Fig. 5, a design for a handy hen roost, for which we have to thank our friend, Lynn D. Wood, of Elden, N. Y. This

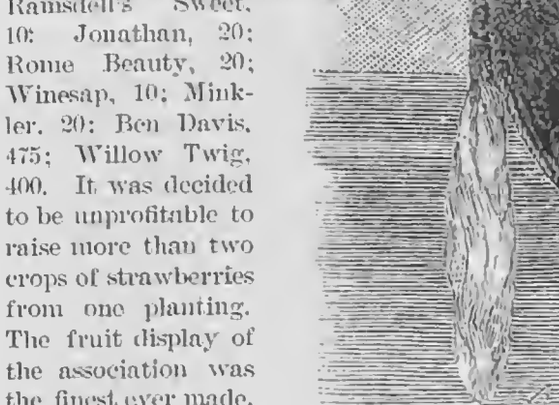

Fig. 5.

roost is very simple and can be constructed at little or no expense. For cleanliness, which is of the utmost importance in poultry keeping, and for handiness in clearing away the droppings, it will be hard to beat. The end boards are sawed out in the shape represented at the bottom of the figure. The roosts are round, with the ends hewed to fit into the notches. The boards at the lower end are nailed fast to the side-pieces; but the bottom boards are simply placed on cleats so that they can be removed at will and cleaned. The roosts, too, can be easily taken out and cleaned. The whole arrangement can be set up on posts, as shown in the illustration, or fastened to the walls.

The Post Office Department has received information of a supposed swindle by New York law sharks operating through a local attorney in West Virginia upon a considerable number of people who are heirs of an Englishman named Drake. The operators are representing to these heirs, some seven hundred in all, as reported, that there is a vast estate in England in the name of their progenitor, Drake, waiting distribution, and that certain litigation is necessary before the distribution can be accomplished. The litigation, of course, is somewhat costly, and the heirs must foot the bill, but this it is held out to them, is but a mere trifle when compared with the vast benefit to accrue to them upon the successful issue of the suit, which issue is a certainty. The last assessment issued for this purpose was for $16 each for adults of the present generation, and for children or sub-heirs in proportion to their rights under the law of descent. The local attorney, through whom the enterprise is being operated, lives in Ritchie County, and he has succeeded in working up the Drake relationship into a state of infatuation over the early prospects of great wealth. It is thought the case will come under the statute prescribing a penalty for using the United States mails for fraudulent purposes. The Drake kindred are said to live principally in Ritchie, Kanawha, Clay, Roan and Calhoun Counties.

A Southern paper has reached this office which contains the advertisement of an uncommonly gifted physician. It is stated that "From a strictly scientific knowledge of the structure of man, He tells the Disease at a Glance, Without asking any Questions, Looking at the Tongue of Feeling the Pulse." It is further stated—in order that the climax should not be left without a nice, becoming cap—that "No examination is necessary—no information from the Patient—no previous knowledge of the Case. Every ache, pain and disagreeable feeling pointed out and described fully, clearly explicitly and better than the patients can themselves." It is unnecessary to say that this is the sort of a doctor for whom the world has anxiously been waiting. He ought to have a great career before him—if he doesn't die prematurely of modesty. Of course he is a fraud. Have nothing to do with such charlatans, who are quite numerous in country places.

TO SEVERAL INQUIRERS: We have received favorable reports of B. V. Head, Vienna, Va. ..... The Bohemian Oats swindle has been frequently exposed in this place during the last five or six years ..... The chemical compound in most, if not in all, of the hand grenade extinguishers is but little, if any, better than a strong solution of salt and water. Their efficacy for extinguishing fires depends entirely upon the coolness and accuracy of the person using them, and a person possessing the same presence of mind and good judgment, would in most cases put out a fire as quickly and as effectually with water, or whatever might be at hand suitable for the purpose, as with a hand grenade ..... Emil Bassett, *alias* Theodore Lenk, *alias* Pemberton, Ayer & Co., of 29 and 31 Chatam Street, this city, is a swindler. Marsh & Basset Watch Company is another *alias* of the fellow, who also operates under the name of the Norman Electric Lamp Company. ... The Moore's New Process of butter making is a humbug . .... Again we say no one should buy land in Florida until he has inspected it in person, or got a trustworthy friend to do so. There are a great many swindling concerns offering land for sale there: some of them we have exposed already, and we are investigating others! But it is slow work .....The American Bureau of Geneological Inquiry of New Haven, Conn., is a humbug .....We do not advise anybody to deal with any concern that offers goods at half price for 30 days or any other period. One concern is widely advertising an "organetta" for $2.25 for 30 days, after which purchasers must pay $5! Humbug!

For Women.

CONDUCTED BY MISS RAY CLARK.

AN UNSATISFACTORY VISIT.

MAY MAPLE.

I WAS just putting the vegetables into the kettles for dinner, when I espied some little folks, one, two, three, passing the window. One was a little toddler, carried in the arms of an elder brother, so I knew their mamma was not far away, and most likely their papa had gone to the barn; and so it proved.

They all received a cordial welcome, for they were old time friends. "But how about the dinner?" I hear some nervous Martha inquire. "An addition of five make such a difference in one's previous calculations. One always wants to treat their honored guests to the best the house affords, and that may be nothing rich or rare.

Very true. But at our house "the best" does not mean a great display of tempting dishes. Our guests share with us of our "daily rations," except on state occasions. And so, in the present case, there was merely an addition in quantity of what we were about to cook before the arrival of our friends. And while the vegetables and meat were cooking we visited. For very soon we had the little folks settled with a box of toys (which we keep for the especial benefit of the children who visit us), and L—— had come into the kitchen saying she came for a visit and she hoped I would not put myself to any unnecessary trouble on their account.

When I told her that I prized her society too highly to spend the whole of the day in getting up a royal feast for stomachs alone, she laughed and said that reminded her of an incident in her life that she too well remembered. "And it happened," said she, "when we were pioneers in this northern region.

"You remember," she continued, "where Mrs. S—— used to live when they first moved into the county. It must have been about four miles from our place, and I had never been accustomed to long walks. But one morning I started out for a visit, with her. I reached my destination about eleven o'clock, feeling a good deal tired and not a little hungry."

"Mrs. S—— seemed overjoyed to see me, and we sat and chatted without interruption for, perhaps half an hour, and then the duties of hostess seemed to rush in upon her mind like a great tidal wave. So she excused herself, and began preparations for *dinner* as I supposed. Vegetables and meat were soon prepared, the tea kettle filled, and all were set on the back part of the stove, to await further proceedings. Then a pie was manufactured; also two kinds of cake, cookies and biscuit. The stove oven was small, admitting but two small tins at a time. When her baking, boiling and frying were all done, it was nearly three o'clock; in addition to all these, three or four kinds of sauce were placed upon the table; each kind being brought from the cellar, which was reached by means of a ladder, and through a heavy trap door that was opened and closed for each successive article. At last everything was smoking upon the table, and I flattered myself that my empty stomach would soon be comforted, and Mrs. S—— would be obliged to sit down for a few minutes at least. She was about to place the chairs, when she declared she could not stomach to eat while her floor was in such a plight. So she swept and washed the floor, and changed her dress, before having the meal served. As it was Autumn when I made my visit you can imagine what a pleasant time I had returning home through the woods after dark.

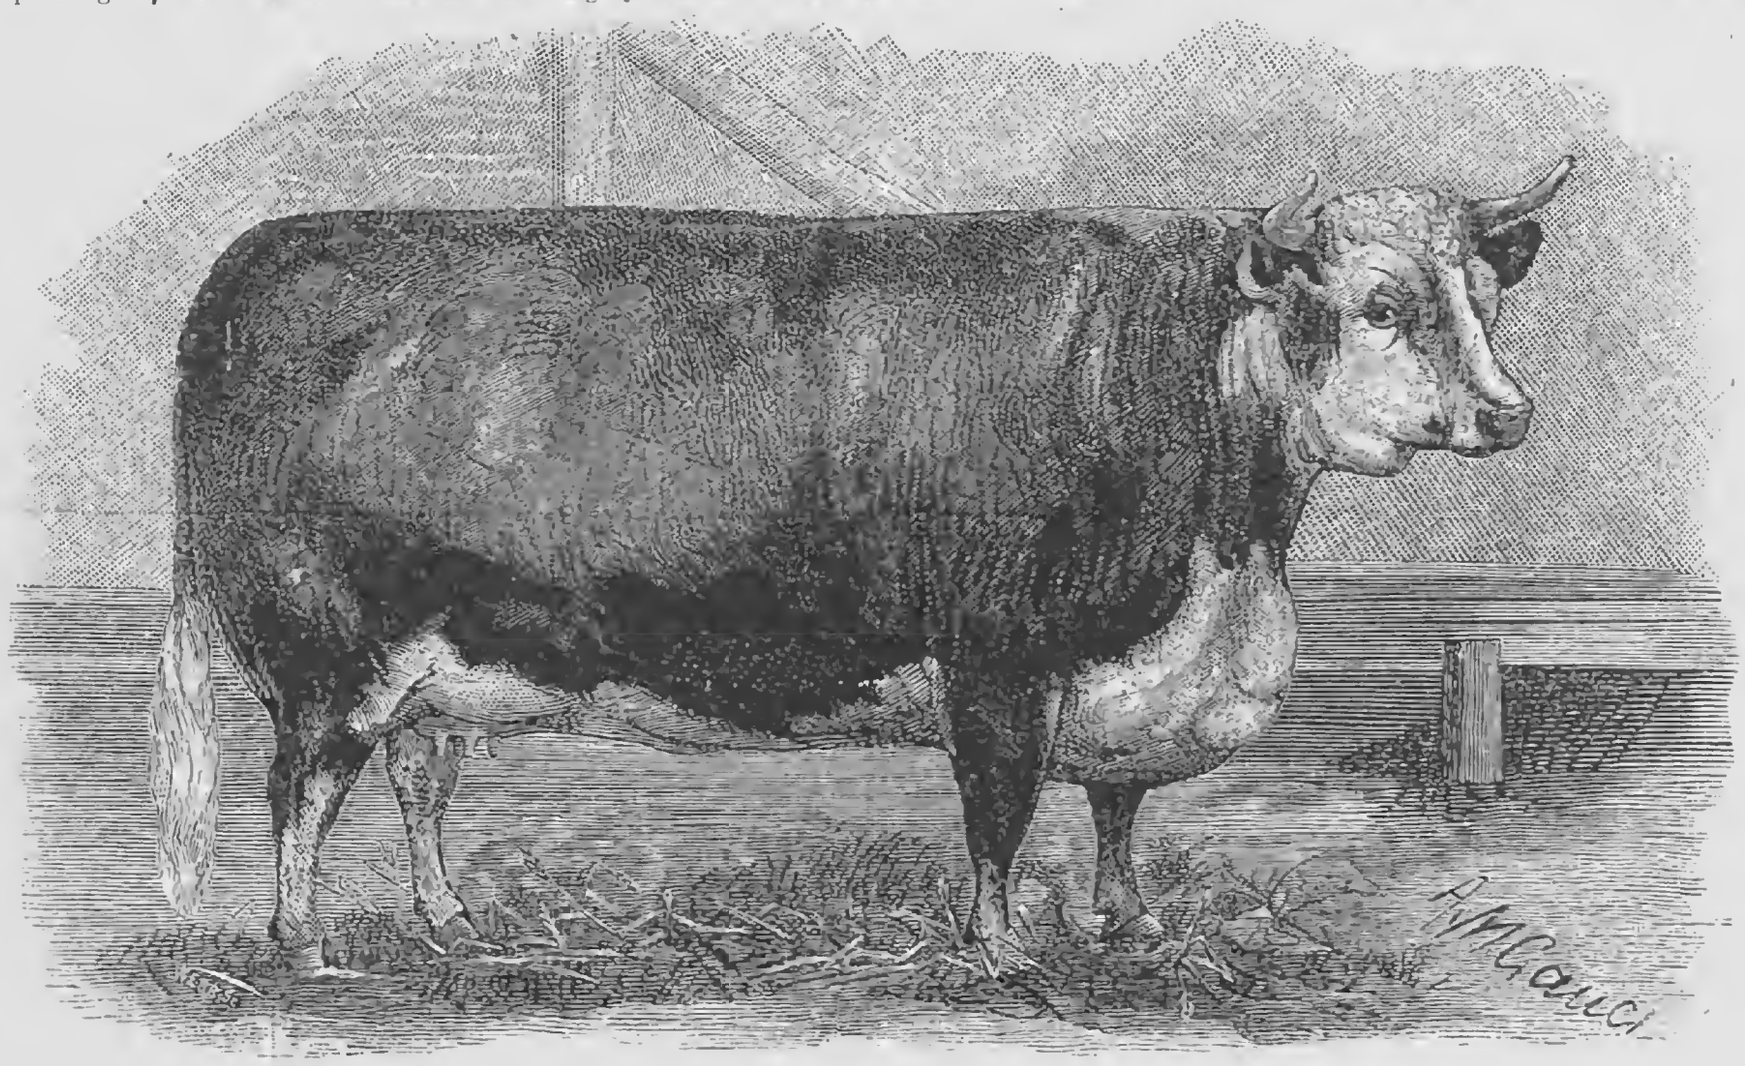
"I was bitterly disappointed; I wanted to have a good visit with her intellectually. For she was well read and possessed splendi conversational powers, which she used to good advantage when away from home. But that day her whole mind was engaged in exhibiting her ability as cook and housekeeper.

"That was a visit that gave no pleasure to myself as guest, and I am sure the tired, overworked hostess would much rather I had remained at home."

What nonsense! and yet who has not passed through the same experience? And who has not relished the simple fare of bread and butter with a cup of tea or coffee, and perhaps a sip of sauce, with a chatty friend, and at the same time been refreshed, entertained and instructed.

Why spend the whole time of your visitor's stay in getting up a great feast, when you have good reason for believing they have an abundance, at home, of the good things of earth?

Farmers can live, and should set an every-day table good enough for any chance friend who may come, no matter what his calling may be, and when a farmer's wife must spend a whole day to get up a meal for a single guest, on an ordinary occasion, it certainly looks as though good living was for company and not for the family.



HEREFORD VANITY 7th. (Re-engraved from the London Live Stock Journal.) Fig. 10.

THREE NEW YEAR'S DAYS.

ANNIE L. JACK.

"I'LL never come back till I'm rich enough to buy out Squire Watson." The speaker was a lad of 18, and he had his hand on the latch of the kitchen door, while saying good-bye to his mother and younger sister. A fierce hatred of farm life had possessed him for years, and he was at last about to be emancipated, for Dickson Lawton & Co. had sent word from the far off city to select them a clerk, and the Sunday-school superintendent, to whom the letter came, gave George Bushnell the first chance, and he could not give up the long coveted opportunity. So a neighbor had engaged to work the farm on shares, and everything was arranged for his going, only it did seem too bad that he had to say good-bye on New Year's Day, in order to reach his destination in time for work the day after, and Mrs. Bushnell's face paled, and her heart sank at the thought of the long, winter evenings on the lonely farm without George'

cheerful face and his helpful presence. True, she had "Nora" and the neighbors were kind, but what can take the place in a poor widow's heart of her first born, her only son? And yet it seemed flying in the face of Providence to think of refusing, for the salary was good, with prospects of a rise, and the farm was stony and hard to till. Besides George had always been fond of study, and fretted because he could not make any progress at home. Once his discontent was known so far as to reach the minister's ears, but the advice and consolation he received from that source was not likely to encourage him, "Bind the book to the handle of your plow, and study while you work and while you eat." This was all very well in theory, but was wasted advice as far as George was concerned. For a plow is a ticklish thing on stony land, and when the lad came in at night, after seeing his horses were comfortable and doing the out door chores, besides bringing in wood and water, he was generally too tired and sleepy to study, and even resented the idea. And so he must go out into the world that was so wide and so full of dangers, and leave her to depend on strangers, to fight for bread for herself and Nora, who was trying to fit herself for a position as teacher, by dint of hard study in the academy two miles away. The sleigh came to the door, the last trembling good-bye was said, and he was gone, while with tearful gaze she watched the last glimpse of his tall and rather ungainly figure till all vanished in the dim distance. And the flakes of snow began to fall silently and cover up even the track of the sleigh, while Nora drew near the fire, and tried to make the most of the remaining hours of the old year tide.

Oh! these children, how they become at once our solace or our care, and fill the mother heart with fears and many a deep, dumb pain. You are over the nest now, birdling, and singing a song of freedom as the sleigh-bells, and the car whistle and the church bells mingle this eventful night.

A year passes by, the spring blossoms, the summer's heat, the autumn rain, and once more the snows of a New England Winter. Mrs. Bushnell had spent the Thanksgiving in solitude with her young daughter only for company, but she set about her preparations for the New Year in the hope that George would come to share it with them. He had sent them money, not much, of course, but enough to prove his thoughtful love and remembrance; yet she thought she noticed an eager desire for acquiring wealth, a craving for position at all hazards that filled her with alarm. But there was no want of faith in her careful preparations, no lack of hope in the burnishing and polishing of her little best things, and the goose was nearly stuffed when Nora came in from school bearing in her hand a letter. "From George, surely he is coming?" she asked, dismayed; but it read as follows:

"Dear Mother and Sister: I am sorry to say I shall not be at home for New Year's dinner. Squire Watson and his daughter Minnie are in town and have invited me to dine with them on New Year's Day. They are expecting some other guests and I think it will be as well to stay and get acquainted with some people of good social standing, so that I may have a few friends. I inclose you a little cash as a Christmas gift. I wish it could be more, for my own sake and yours. Wishing you a happy New Year I remain

Your affectionate son, GEORGE."

Poor Mrs. Bushnell sat down and cried bitterly; but Nora, with tears in her own eyes, said plaintively: "You have *me*, mother," and they talked each other into becoming reconciled. And on New Year's Day they invited lame David Nelson and poor Widow Dobbs with her two children, and tried to enjoy the goose and other extras that furnished the feast. And softly in the twilight David and Nora sang till the mother's heart grew tender and hopeful with the soothing words. It was so sweet to know that

"Only a little while
Of walking with weary feet
Patiently over the thorny way
That leads to the golden street.
Suffer if it's God's will,
And work for Him while we may:
From Calvary's cross to Zion's crown
Is only a little way,"

and in the far-off city, flushed with the new excitement of being in the company of those socially his superiors, smiled upon by a pretty girl, who always smiled on young men, from habit and a love of conquest, George spent the first evening of the New Year. He tried to make himself believe that his mother would be pleased and proud that he remained, for Squire Watson was the richest man in their country village, owning a great deal of property, and spending his Winters in the city with his pretty daughter, who meeting George in the store where he was employed one day, had renewed the acquaintance in a spirit of coquettish caprice. He thought he had done his duty by the mother and sister at home. "A *man* must look out for himself," he said, and his thoughts that evening were of the wildest, most visionary dreaming, so much so that he did not remember Christmas or notice the chiming of the bells, announcing the birth of another year. He was not trying to serve "God and mammon," but was content to try mammon, for the glitter of wealth, the longing for a life of ease above the petty struggles and savings he had seen all his life, took possession of him, and he could think of nothing else. For to him the Christ Child had lost its meaning, he scorned the very thought of a "manger" and after the brilliant lights were out in the mansion that had entertained him, this memorable evening his thoughts as he returned to his third-class boarding house were how to obtain such wealth as Squire Watson seemed to possess.

To Mrs. Bushnell living at the quiet farm, it seemed like a fairy story to read the letters that came from George of his doings in the city. Parties and concerts, dinners and receptions followed in quick succession, then a pause, and in the Spring came the news of Minnie Watson's marriage to a wealthy stock broker. George did not make many comments; he seemed quite engrossed with his business, and in a small way engaged in speculations that proved successful. Then in the early Autumn came news of Mr. Watson that was very disquieting to his old neighbors. Stories of alarm and fears of trouble were rife in the country, and at last as the new year was approaching again, there was certain word that he had been arrested for forgery, and all his estate was under the hammer. There was not much of joy in Mrs. Bushnell's heart when the evening came round that seemed always of necessity one of special preparation. It was true that Nora had passed her examination with honor, and was still to be near her and teach in the district school, but her heart yearned for her boy of whom she had not heard for a long while. The evening closed in with drift and snow, but the next day was clear and cold, and early in the morning, lame David came over to be their guest for the day. It was a very sad face that bent over the preparations that morning, and she sent Nora into the little parlor to talk to David, and sing some Christmas hymns, while she tried to keep her mind employed with the words so comforting and soothing while her hands were busy. She had faith in George; he would not fall, though blinded by the glamour and glitter of the rush for wealth. And as she sat down to sort over the cranberries, a click of the latch caused her to look up, and there he stood, pale and careworn, but with his honest eyes looking into hers. "Oh my boy!" was all she could say, as she clasped him in her patient, motherly arms, and he answered, "I have come back to finish my New Year's Day, mother, and am richer than Squire Watson, though I have not a dollar." It is needless to repeat the story of his awaking. The shock that came to him when his patron's dishonorable dealings were made public, the revulsion of feeling, that caused him to long for his old home and for the steady, honest, simple life he had left, and the faithful, patient mother, "I am going to stay now," he said, "for I believe there is wealth on the farm if only I can work it intelligently. And meeting men who look down on farmers, I find they are not often as well read or as thoughtful as country people are, only there is a polish that attracts and dazzles one, and the city press and public that sneer at 'country bumpkins' are to blame for the false sentiment that sends thousands of young men to the city." All this and much more George said in snatches that morning, and afterward to his young companions; but it was of little consequence to his happy mother, so long as she had him with her and heard his reassuring words of his remembrance and longing for her and for his home. Brave mother, the reward has come of patient endurance and kindly charity, while all unconscious of the arrival, the singing continued in the inner room and the voices chimed sweet and clear as the forerunner of a jubilee.

"Good tidings of great joy
To all people do I bring,
Unto you is born a Saviour
Who is Christ the Lord and King!
Gospel bells! how they ring
Over land and over sea!
Gospel bells, freely bring
Blessed news for you and me."

"NOTHING BUT LEAVES."

It seems very sad to see a lone woman left in middle life with "no resources," as we commonly use the term, and obliged to eke out a support by her hard labor, or to "eat the begrudged bit and drink the begrudged cup" in some home where she should be welcome. But even such a life has its compensations and rifts in the clouds. Hard work itself brings deep, sweet sleep, and there are little children in most homes whose love can be won by a wise, loving woman. Books and papers are a resource, also, for leisure hours.

But I know a woman growing old who has means enough to procure the comforts of life, but whose existence is wretched because she has no resources except money. Her mind has been left a blank. Fancy work filled up the years that should have been given to self-improvement, the love of kindred was never won; children were too much trouble about the house, to be much encouraged in their visits. She depended wholly upon father and mother to decide for her in any matter of importance in life, and now that both are gone she is like a shipwrecked voyager at sea in an oarless boat. She can scarcely decide the smallest matter, but worries and distresses herself over the merest trifle, asking advice of all and yet unable to decide which council to follow, making herself nearly distracted by her indecision. Though a woman of nearly 50, she needs a steady guiding hand as much as she did at 10.

She had good, natural capacities, but she left them all to run to waste. "She never could bear to read," said her niece, and now when time hangs heavy on her hands she has none of the rich enjoyment she might find in such occupation. The joys of benevolence she has never known, so the blessings of the poor and needy does not gladden her pathway. Her worrisome ways strike terror to the heart of every household where she decides to visit for a week, or two. Even where they have the kindest of wishes and sincerest of pity for her loneliness. One cannot but wonder what will she be at 60 if nature keeps her alive when she finds life such a burden now.

Whatever resources for old age we may lack let us not fail to lay up abundant stores of head and heart riches. OLIVE.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

KITCHEN TALKS.

ANNIE L. JACK.

There was a council meeting in the kitchen to discuss Christmas, and the ways and means of accomplishing what we desired.

"I wonder what is best to give"—

"Books," interrupted the Student.

"Man cannot live by books alone," said the Amateur Cook."

"Neither can he by mince pie alone," said the Artist, who had taken the easel to a sunny kitchen window and was busily engaged painting a little winter scene therefrom. It was only a tree laden with snow, where some hungry sparrows hopped and twittered about; but there was sunshine on the grass, and weeds that glittered with frost. There was a golden sheen everywhere, that our artist could not fully depict. But the pause that followed was eloquent, as the brush worked industriously, and the rolling-pin came down heavily on the baking board.

"That gives me an idea," she said.

"Hold it fast, dear," responded the Idler from the depth of an arm-chair; "it is an event of unusual interest." The "Cook" gave a glance of withering scorn and continued.

"You know that fruit we put up that we did not need, just because it was going to waste—strawberries, raspberries and cherries! Why not give that away to some people who have none, as well as pen-wipers, or slipper cases."

"Oh don't," said the Epicure. "We can eat it all."

"Greedy boy!" said the generous Cook, her cheeks blushing with the kindly impulse, "but you know we do not need it all, and I believe in giving sometimes in unusual ways. Don't you remember how pleased Mr. Bagot was last year when we sent him a nice box of celery packed in sand? I believe in trying to give just things for Christmas, that people need, and not for show. Why one year I got four things all alike, and another year three, when one was quite sufficient. Now if anyone gave you three or four jars of fruit, you could eat them by degrees"—

"I only need a gold mine," said the Idler.

"Then you would be too idle to work it," retorted the Student.

"Come, children," I interrupted, "be considerate of each other's feelings. I think our "Cook" has the proper estimate of gifts, and I indorse all she says. There is a great deal of useless giving just for the form of the thing, and it has become an extravagance in many ways. But find out if possible what your friend lacks, and try to supply a need. Christmas is the time when we are free to bring our frankincense and myrrh, and offer them at the shrine of friendship in memory of the Christ child. I remember once a kind housekeeper who could make neither slippers nor dressing-gowns, but she cooked a turkey, made some pies and cookies, and other dainties and left the basket at the minister's door on Christmas eve, running away before they had time to answer the knock. I am sure he appreciated it, having a delicate wife whose hands were full. So give what is most suitable to the receiver, whether it be fruit, or any other product of your home industry, children."

(The above article came too late for timely publication.—E. M.)

LITTLE ECONOMIES.

The question of how to make every dollar go the farthest is an important one in the majority of households. For each family like the Vanderbilts, Goulds, Astors and others of like riches, who possess the means for gratifying every wish, there are thousands upon thousands who can scarcely make both ends meet. In such homes the art of making the most of little things, of utilizing the odds and ends, of planning so that 25 cents, carefully spent, will go as far as 50 cents thoughtlessly expended, will make a great difference in the comfort and prosperity of the family.

While making a visit not long since I took down a few jottings in planning and economizing, which I thought very suggestive. Said my hostess: "For the first few years of our married life, it was a difficult matter to do more than just come around even at the end of the year. It seemed so hard not to have any spending money; not to be able to take any reading matter or to spend money for anything but just the bare necessities of life! I set my wits to work to see if I could not manage to save a little in different ways, so as to have a little margin after the necessaries were bought. And as small as the results are in each item, they make quite a difference on the whole. For instance, I used to consume an eight-cent bar of soap in doing my week's washing. I now use Babbitt's washing compound in connection with the soap, and the cost is reduced to half what it formerly was. I put the clothes to soak over-night in warm water, in which has been dissolved one heaping tablespoonful of the compound, according to the directions. This soaking greatly facilitates the washing, and at the same time less soap is required.

"Every white apron that I own is made of the back parts of my undergarments. The fronts always wear out first, and the aprons made from the backs last quite a long while for afternoon wear. On the other hand, my morning aprons are made of heavy gingham and extend to the bottom of my dress and far in the back, so that my dress is thoroughly protected.

"My husband likes meat at least once a day. We cannot afford sirloin roasts and expensive

Miscellaneous Advertising.

The country is flooded with highly chemicalled and very dangerous soaps, the result of the fierce competition among soap makers, and the average housekeeper can not determine which is the safest to use. Prof. Schaeffer, of Cornell University, says, "My analysis "shows the Ivory "Soap to be a remarkably good article, and "by actual trial in my "house it has proven "itself to be an excellent laundry soap."

Free of charge. A full size cake of Ivory Soap will be sent to any one who can not get it of their grocer, if six two-cent stamps, to pay postage, are sent to Procter & Gamble, Cincinnati. Please mention this paper.

steak, and what is worse than a tough piece of cheap meat? But I can now cook cheap meat so that I am not ashamed to place it before the most fastidious epicure. I get from three to five pounds of meat, costing from six to eight cents a pound. Such pieces come from the neck and legs. This meat is always cooked on baking or ironing days, so that extra fire is not required for it. I put it on directly after breakfast, in an iron kettle, in about two inches of water. It must commence boiling immediately and boil fast all during the forenoon, as the meat is mostly cooked by steam. The water should be kept at a depth of about two inches, and occasionally the meat should be turned over. As noon approaches, I let all the water boil out of the kettle and let the meat brown on one side. When that side is nicely browned I put in one cup of water and allow it to boil out, then turn the meat to let the other side brown. I watch it carefully to see that it does not burn. When it has browned a nice, rich color, I put in water enough for gravy. Water and flour are then smoothly mixed and the gravy is thickened. The meat remains in the kettle while the gravy is being made. Cheap meat cooked in this way is both tender and delicious. The amount I cook is sufficient for two dinners.

"You have just spoken of the cozy appearance of my sitting-room. The most of its furnishings are the works of our hands. John made the frame to that lounge, in the evenings, while I did the work of upholstering. That large easy chair was an old frame of a chair that I painted and varnished, then upholstered and covered with that heavy, dark cretonne. These rugs that you so admire were hooked from old clothes and rags that I dyed."

The articles referred to were not only comfortable, but really handsome; and yet the cost was comparatively trifling. In purchasing goods it is always an economy to get a good article. It costs more to buy first-class articles in shoes and dry goods, but oftentimes they will wear twice as long as those of a cheaper and inferior grade. To buy good cloth is a saving not only in money, but still more in labor. I have known of persons who made two garments of cheap material that would last no longer than one made of good cloth.

NELLIE BURNS.

SOME NICE QUILTS.

At a recent loan exhibition which I attended, the display of quilts was much spoken of. There were 25 of various kinds in one alcove. As the long winter evenings, with their leisure and lamp light, are approaching, perhaps a description of a few will be acceptable.

By virtue of seniority, the first mention is claimed by a quilt labeled "Made in 1790." It was of very fine white linen, with an elaborate center-piece and border. The center was a cornucopia filled with flowers and leaves, and the border was a grape-vine design. The outline of every leaf and flower was done in the finest back-stitching. The lining was of linen of very open texture, and through this the pattern was stuffed with cotton, so that the flowers showed in bold relief. The quilt was bordered with a knit or netted linen fringe.

Of richer materials, but not more beautiful than this, was a Japanese quilt prepared by the ladies of an eastern congregation as a present for their pastor's wife on occasion of the couple's silver wedding. The blocks were 12 inches square, and each was made according to the fancy of its donor. The only point of similarity was a triangular patch in one corner of each block, which was fastened down on two sides, the diagonal being closely buttonholed. This patch was of dark satin or velvet, placed on a square of light color, being fastened in with it. On raising the loose edge of this patch, one could see the name of the giver on the light material beneath. This gave it the value of an autograph quilt to its recipient, without the outré effect produced by the bad writing and occasional blots that disfigure so many album quilts. The center block was of plain, old gold satin, on which was a sketch of the church, which was rather ornate in style, done in etching silks by an artistic parishioner. This was especially appropriate, as the silver wedding of the pastor was also the 25th anniversary of his settlement over that congregation. The quilt was lined with crimson satin and edged with heavy cord in black and gold. There were other elegant quilts of Japanese or crazy designs, but this was the most interesting. I saw on some of the most elaborate, a feature that I would criticize. This was the introduction of bits of delicate lace and bows of bright ribbon in place of embroidery. Such fragile material as lace seemed out of place with the heavier materials, and the ribbon bows looked as if they would drop off sooner or later.

A cloth quilt comes next on our list. It was made entirely of blocks of fine black cloth in the figured styles now so much worn by men. Each block was four by seven inches in size, and was ornamented by an embroidered figure—a flower, a stork, an owl or a fish, and many other things, quaint and pretty. The blocks were separated by black dress binding, stitched on both edges and ornamented with fancy stitching in bright silks. Such a quilt is nice to spread over the back of a lounge, and is not so easily soiled as a silk one.

A plainer, and perhaps more useful quilt was made of scraps of worsted dress goods. Pieces of the best dresses of several generations of one family were there, and it was quite pleasant to note the differences of designs and textures. The fancy stitching on this was done with zephyr yarns.

A lovely bed comfort was of cheese cloth tacked with light blue Germantown yarn and losely button-holed around the edge with the same. It had in it three pounds of cotton and was very soft and warm.

A splendid bed covering for our Western winters, where a temperature of thirty degrees below zero is not unusual, was made of two old merino dresses, a brown and a garnet, set together in alternate stripes. It was lined with an old blanket (with its holes and thin places neatly darned, then colored light-brown with Diamond Dye), and filled with three pounds of wool batting. Such comforts are very warm and seem much lighter than those made with cotton though they may weigh the same.

DOMESTIC RECIPES.

AN EXCELLENT FRUIT CAKE.

Two pounds of sugar, two pounds of butter, one-half pound of lard, one pound of eggs, two pounds of raisins, two pounds of currants, one pound of mixed peel, two teaspoonfuls of allspice, one teaspoonful of cinnamon, one teaspoonful of cloves, one teaspoonful of ginger, one nutmeg, one teacupful of milk, three pounds of flour, four teaspoonfuls of baking powder. Mix until very stiff and bake in a steady heat for four hours. If you wish to keep this cake for a long time, use a cupful of water in the place of the milk.

PLUM PUDDING.

One pound of chopped suet, one pound of raisins (stoned), one-and-one-half pound of currants, one-half pound of candied peel, one pound of bread crumbs, one pound of flour, one pound of sugar, six eggs, one nutmeg, and other spices to suit the taste, a small glass of ale. Boil in a pudding mold six or eight hours. Serve with cream sauce.

S. M. TAPLIN.

NEAPOLITAN CAKE.

Black: Take one cup of butter, two of brown sugar, one of molasses, one of strong coffee, four-and-a-half of sifted flour, four eggs, two teaspoonfuls of soda, two of cinnamon, two of cloves, one of mace, one pound of raisins, one of currants, and a quarter of a pound of citron.

White: One cup of butter, four of white sugar, two of sweet milk, two of corn starch mixed with four-and-a-half of sifted flour, whites of eight eggs, two tablespoonfuls of baking powder, one-half teaspoonful of extract of bitter almonds. Bake the cakes in round jelly pans with straight edges; the loaves should one-and-a-half inch thick after baking. When the cake is cold, each black loaf should be spread with a thick coating of lemon and sugar made as follows:—The white of one egg, thoroughly beaten, the grated rind of two, and the juice of three lemons, powdered sugar enough to make a thick frosting; lay a white loaf on each black one and frost as you would any other cake. This cake is most delicious.

EMMA GRIGSON.

BROWN BREAD.

Every one who eats of my brown bread says it is excellent. I made four loaves for our last church social, and there was not half enough of it. The ingredients are: half cup of molasses, one-third of a cup of lard or butter, three cups of sour milk, one teaspoonful of soda. Add brown flour to make it just as stiff as can be stirred with a spoon. Dissolve the soda in hot water and stir it in the last thing. Try it if you want something good. MRS. W. F. B.

CAKES FOR LITTLE FOLKS.

Break two eggs in a teacup and fill it up with sweet cream; add one cupful white sugar and two teaspoonfuls of baking powder sifted with two cups of flour. Flavor to taste, beat well and bake in patty tins. In the center of each put a small china doll, cover the cakes when baked with chocolate or white icing. The dollies will be "raised" in various positions, and will make fun for the little folks, and the little folks' remarks will make fun for the big folks.

MARY MANN.

QUICK PROOF.

The quick proof mentioned in RURAL of Dec. 19 is good two weeks or more, and may be made of wheat canaille if fresh meal is not convenient.

Miscellaneous Advertising.

Take it during the spring and summer months. The peculiar taint of scrofula lurks in the constitutions of multitudes of men, but can be expelled by the use of Ayer's Sarsaparilla. M. J. Conway, 337 Hicks st., Brooklyn, N. Y., writes: "Two years ago I was examined, at the Long Island Hospital, in this city, and my case was declared to be Salt Rheum. Large scales covered my legs, and were constantly dropping off; my eyes, also, were badly affected. My only relief was in warm salt water baths. I was unable to remain in a warm room, and could only sleep under very light bed-clothes, as the heat increased the burning and itching. The use of

This Month is the time to take Ayer's Sarsaparilla. A. F. Willard, Rogers' building, Boston, Mass., says: "I know of no remedy of equal efficacy with Ayer's Sarsaparilla in cases of debility, and as a spring medicine." Rich'd H. Lawrence, M. D., Baltimore, Md., writes: "It affords me pleasure to testify to the success which Ayer's Sarsaparilla has had in the treatment of cutaneous and other diseases, arising from a vitiated condition of the blood. Were it necessary, I might give you the names of fifty individuals who have been cured of long-standing complaints, by the use of Ayer's Sarsaparilla. It is a specific for the most obstinate cases. Ayer's Sar-

Ayer's Sar saparilla gave me great relief. The itching abated, and I continued to improve until the cure was complete."

saparilla is, without exception, the best blood purifier and prophylactic with which I am acquainted."

For sale by all Druggists. Price $1; six bottles for $5.

WHOLESALE PRICES ON BOOKS

COMPLETE NOVELS AND OTHER WORKS ALMOST GIVEN AWAY $4.00 WORTH BOOKS FOR $1.00.

To open at once a direct trade with the reading public, we have decided to offer this list of books at prices which are far below those usually charged to newsdealers at wholesale. If you buy these books at a store, you have to pay the dealer a profit to cover his rent, clerk hire and expenses. Save this by ordering direct of headquarters, and get the books delivered at your P. O. for half the price you could buy them for. Send us a small order if only to see how low books can be sold. These are published in neat pamphlet form, many of them **handsomely illustrated**, and all are printed from **good type upon good paper.** They treat of a great variety of subjects, and we think no one can examine the list without finding therein many that he or she would like to possess. In cloth-bound form these books would cost $1.00 each. Each book is complete in itself.

1. **The Widow Bedott Papers.** This is the book over which your grandmothers laughed till they cried, and it is just as funny to-day as it ever was.
2. **Fancy Work for Home Adornment,** an entirely new work upon this subject, containing easy and practical instructions for making fancy baskets, wall pockets, brackets, needle work, embroidery, etc.; etc., profusely and elegantly illustrated.
3. **Grimm's Fairy Stories for the Young.** The finest collection of fairy stories ever published. The children will be delighted with them.
4. **The Lady of the Lake.** By Sir Walter Scott. "The Lady of the Lake" is a romance in verse, and of all the works of Scott none is more beautiful than this.
5. **Manual of Etiquette** for Ladies and Gentlemen, a guide to politeness and good breeding, giving the rules of modern etiquette for all occasions.
6. **The Standard Letter Writer** for Ladies and Gentlemen, a complete guide in correspondence, giving plain directions for the composition of letters of every kind, with innumerable forms and examples.
7. **Winter Evening Recreations,** a large collection of Acting Charades, Tableaux, Games, Puzzles, etc., for social gatherings, private theatricals, and evenings at home; illustrated.
8. **Dialogues, Recitations and Readings,** a large and choice collection for school exhibitions and public and private entertainments.
9. **Parlor Magic and Chemical Experiments,** a book which tells how to perform hundreds of amusing tricks in magic and instructive experiments with simple agents.
10. **The Home Cook Book and Family Physician,** containing hundreds of excellent cooking recipes and hints to housekeepers, also telling how to cure all common ailments by simple home remedy.
11. **Manners and Customs in Far Away Lands,** a very interesting and instructive book of travels, describing the peculiar life, habits, manners and customs of the people of foreign countries; illustrated.
12. **Sixteen Complete Stories** by Popular Authors, embracing love, humorous and detective stories, stories of society life, of adventure, of railway life, etc., all very interesting.
13. **The Budget of Wit, Humor and Fun,** a large collection of the funny stories, sketches, anecdotes, poems, and jokes that have been written for some years; illustrated.
14. **Useful Knowledge for the Million,** a handy book of useful information for all, upon many and various subjects; illustrated.
15. **Called Back.** A Novel. By Hugh Conway, author of "Dark Days," etc.
16. **At the World's Mercy.** A Novel. By Florence Warden, author of "The House on the Marsh," etc.
17. **Mildred Trevanion.** A Novel. By "The Duchess," author of "Molly Bawn," etc.
18. **Dark Days.** A Novel. By Hugh Conway, author of "Called Back," etc.
19. **The Mystery of the Holly Tree.** A Novel. By the author of "Dora Thorne."
20. **Shadows on the Snow.** A Novel. By B. L. Farjeon, author of "Bread-and-Cheese-and-Kisses," etc.
21. **The Gray Woman.** A Novel. By Mrs. Gaskell, author of "Mary Barton," etc.
22. **The Frozen Deep.** A Novel. By Wilkie Collins, author of "The Woman in White," etc.
23. **Red Court Farm.** A Novel. By Mrs. Henry Wood, author of "East Lynne," etc.
24. **In Cupid's Net.** A Novel. By the Author of "Dora Thorne."
25. **Back to the Old Home.** A Novel. By Mary Cecil Hay, author of "Hidden Perils," etc.
26. **John Bowerbank's Wife.** A Novel. By Miss Mulock, author of "John Halifax, Gentleman," etc.
27. **Lady Gwendoline's Dream.** A Novel. By the author of "Dora Thorne," etc.
28. **Jasper Dane's Secret.** A Novel. By Miss M. E. Braddon, author of "Aurora Floyd," etc.
29. **Lecline.** A Novel. By Mary Cecil Hay, author of "Brenda Yorke," etc.
30. **Gabriel's Marriage.** A Novel. By Wilkie Collins, author of "No Name," etc.
31. **David Hunt.** A Novel. By Mrs. Ann S. Stephens, author of "Fashion and Famine," etc.
32. **Reaping the Whirlwind.** A Novel. By Mary Cecil Hay, author of "Old Middleton's Money," etc.
33. **Dudley Carleon.** A Novel. By Miss M. E. Braddon, author of "Lady Audley's Secret," etc.
34. **Esslea;** or The Mystery of the Highlands. A Novel. By Ella W. Pierce, author of "The Birth Mark," etc.
35. **A Golden Dawn.** A Novel. By the author of "Dora Thorne," etc.
36. **Valerie's Fate.** A Novel. By Mrs. Alexander, author of "The Wooing O't," etc.
37. **Sister Rose.** A Novel. By Wilkie Collins, author of "The Woman in White," etc.
38. **Anne.** A Novel. By Mrs. Henry Wood, author of "East Lynne."
39. **The Laurel Bush.** A Novel. By Miss Mulock, author of "John Halifax, Gentleman," etc.
40. **Amos Barton.** A Novel. By George Eliot, author of "Adam Bede," "The Mill on the Floss," etc.

OUR UNEQUALED OFFER We will send any 4 of these books and our catalogue containing prices of all leading papers and books for 12c. in stamps. Any 8 books 20c.; the whole 40 for $1.00. Send stamps, P. O. Note, Registered Letter or Money Order. Address at once and receive books by return mail. FRANKLIN NEWS CO., 725 Filbert Street, Philadelphia, Penna.

PURE MILK.

WARREN MILK BOTTLES

Patented March 23d, 1880.

Adapted for the Delivery of Milk in all Cities and Towns.

A Long Needed Want at last Supplied.

DESCRIPTIVE CIRCULARS ON APPLICATION.

A. V. WHITEMAN, R. N.
72 Murray St., NEW YORK.

TELEPHONES SOLD.

Don't pay exorbitant rental fees to the Bell Telephone Monopoly to use their Telephones on lines less than two miles in length. A few months' rental buys a first-class Telephone that is no infringement, and works splendid on lines for private use on any kind of wire, and works good in stormy weather. It makes homes pleasant; annihilates time; prevents burglaries; saves many steps, and is just what every business man and farmer should have to connect stores, houses, depots, factories, colleges, etc., etc. The only practicable and reliable Telephone that is sold outright and warranted to work.

Chance for agents. No previous experience required. Circulars free. WM. L. NORTON, Buffalo, N. Y.

ANGLO-SWISS CONDENSED MILK.

MILKMAID BRAND.

Economical and convenient for all kitchen purposes. Better for babies than uncondensed milk. Sold everywhere.

News of the Week.

HOME NEWS.

SATURDAY, Dec. 26, 1885.

THERE has just been a socialistic scare in San Francisco, where a Socialistic Revolutionary Association has been detected in a plot to assassinate a score or so of the leading citizens, without distinction of party, Senator Leland Stranford and Governor George Stoneman heading the list. It was proposed to shoot down Chinamen, and burn their quarters. Four of the blood-thirsty miscreants, mainly foreigners, have been arrested. The extremes of social conditions are no where greater than in California, and the sight of wealth easily and rapidly acquired, tends to make poverty reckless and desperate. .. A very wholesome reaction is setting in nearly everywhere against skating rinks. They have been the cause of a great number of deplorable scandals, and have brought shame and sorrow into many families. In several places prohibitory licenses have been imposed on them, and public condemnation is setting strongly against them. . Senator Edmunds has introduced an anti-Mormon bill into Congress, so stringent that, if it passes, polygamy is sure to be wiped out..... There is a regular hydrophobia scare in many towns in different parts of the country, and unmuzzled dogs are being kill in the streets on all sides. The four children bitten by a mad dog at Newark, N. J.,and who were sent to Paris to be treated by M. Pasteur, arrived there safely last Monday and were at once put under treatment. According to the latest accounts, they are doing well. Several others who have been bitten by rabid dogs have also started for Paris, to which dog-bitten people are flocking from all parts of the world.....Capt. Eads's Tehuantepec ship railway scheme has received a great impetus from the recent action of the Mexican Congress in enlarging the concession to the railway,and guaranteeing it $1,250,000 a year for 15 years, on condition that some other country guarantees twice as much for the same period..... ....A great deal of dissatisfaction has been aroused by the action of Land Commissioner Sparks with regard to settlement on the public domain, and a multitude of petitions against his confirmation have been sent to the Senators and Representatives in Congress..... ... The recommendations of Postmaster-General Vilas for supplemental legislation to suppress the lottery lawlessness has resulted in the introduction of a bill into Congress by Senator Wilson, of Iowa, "to prohibit the mailing of newspapers and other publications containing lottery advertisements, and providing a penalty for violation of the same."..... The silver men in Congress are preparing for a vigorous fight in behalf of the "unlimited coinage" of silver. They say that restriction would benefit the moneyed classes at the expense of the debtor classes and the poor generally by increasing the value, and therefore the purchasing power of gold. With money more abundant, higher prices, it is said, would be the rule.....The Grant Monument Fund has reached a grand total of $111,228. The daily additions aggregate, on an average, about $20 .....The small-pox plague has nearly disappeared from Montreal, the deaths now not being over two a day. It is still pretty fatal in the surrounding country, however. .. ..A telegram from St. Paul, Minn., last Wednesday, says that for two weeks the weather in the Northwest was more like Spring than Winter. Snow had disappeared, and a light warm rain was falling—the third time rain has fallen in December since 1870. At date the Mississippi had been opened, having been closed with ice since Thanksgiving,..... ....A company of the 8th United States cavalry, under Lieut. Fountain, were ambushed by hostiles with disastrous results near White House, N. M., Saturday. In the fight that ensued Surgeon Maddox and Privates Collins, Gibson, Hulton and McMillan were killed. Lieut. Cahill and Coporal McFarland were slightly wounded. The Indians numbered 21. After the fight they headed in the direction of Clifton. This is the same band with which Lieut. Fountain had a fight on the 9th. No Indians are reported killed..... The New England Congressmen are reported to be a unit in favor of excluding Canadian fish. The New England fishermen have had the whip-handle the past Summer, but they may find by another year that they will be shut out of Canadian fishing grounds. They cannot afford to look only upon one side of this question. . ....Jacksonville, Fla., had a $450,000 fire some days ago. The fire broke out in Hubbard's warehouses on the dock, spread to the Abel block, in which were the Herald newspaper, Hazzen's billiard parlors, Kurtz brothers and several others. The buildings in the rear of McConkie's, Hubbard's and Abell's blocks on the wharf, with their contents, were destroyed. The total insurance is estimated at $350,000..... Representative Morrison, speaking of the movement in South Dakota, says: "The present Congress will certainly not consent to a division of one-half as a State. The admission of the entire Territory to the Union may be possible."..... During the present session of Congress, 728 bills and joint resolutions have been introduced in the Senate and 71, which originated in the House, have been passed. Twelve hundred and forty-seven executive messages, containing about 1500 nominations, have been sent by the President to the Senate, which referred them to the proper committees; two treaties, one relating to the boundry line between this county and Mexico, and the other providing for the settlement of the claims of certain American citizens against Venezeula, have been sent to the Senate for ratification.

Over-worked Business Men.

As a restorer of exhausted nerve force, it has been largely shown during the past thirteen years that the Compound Treatment of Drs. Starkey and Palen, 1529 Arch Street, Philadelphia, Pa., is the most prompt and efficient agent yet discovered. Its use by over-worked business and professional men would save many hundreds of lives every year, and give to thousands more the ability to work without the weariness, exhaustion, and peril which now attended them. A pamphlet containing full particulars in regard to the nature and action of this remarkable Treatment, will be mailed free. Write for it.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, Dec. 26, 1885.

THE NEW YORK STATE AGRICULTURAL SOCIETY.—The annual meeting of this society has been called at the society's rooms at Albany, on Wednesday, January 20, 1886, at noon. No programme is announced, and we suppose the only business of importance will be the ratification, by the handful present, of the slate that will no doubt be prepared beforehand all ready for the farce. The time was when these annual meetings were a power; when they meant a show of fruit, grains and vegetables, rivaling even that of the State fair; when the farmers gathered until the Agricultural Hall would not hold them, and when two or three sessions were devoted to essays and discussions, full of interest and instruction, equaling a veritable Western farmers' institute. But times have changed since then. Sadly changed! Either the farmers are losing all interest in their business, or the society is slowly but surely drifting away from them. Whatever is wrong it is time it should be righted.

PENNSYLVANIA HORTICULTURAL ASSOCIATION.—The annual meeting of the Pennsylvania State Horticulatural Association will be held at Reading, Pa., commencing Wednesday January 20. A good list of subjects for consideration has been prepared, a lively time is expected and all who come are guaranteed a cordial welcome to Reading. E. B. Engle, of Waynesboro, is the Secretary. Write him for programmes and full particulars. We know he will like to hear from you.

THE VERMONT DAIRYMEN will assemble in the annual winter meeting of their association at Bellows Falls, January 19, 20, and 21. The Secretary, O. M. Tinkham, of North Pomfret, will give information and be glad to receive subjects for consideration. He also urges the farmers to come for a good time and prepared to talk as well as to hear.

All should go!

Artificial eggs are the latest sensation, will artificial spring chickens be the next? ..... Contagious pleuro-pneumonia has broken out among a large herd of cattle near West Willow, Lancaster, Co., Pa. The worst cases have been killed by order of the State Veterinarian, and the others have been quarantined..... Under pressure from the Havre Chamber of Commerce M. Dantresme, the Minister of Commerce, has promised that a bill to abolish prohibitive duties on American preserved meats will be introduced in the Chamber of Deputies after the New Year's vacation. The president of the Paris Chamber of Commerce joined with the Havre delegates in an interview with the Minister, in demanding urgency for the measure in order to give to the American trade its former facilities. On the other hand, the agricultural group in the French Chamber of Deputies have resolved to oppose the importation of American salt meats "in the interest alike of sanitation and of French husbandry." . ... The New York Fertilizer and Chemical Exchange is the name of a new institution in this city, the object of which is to promote social intercourse among its members and especially to introduce a free interchange of opinion upon all subjects of general interest to the trade .. .. First Comptroller Durham has disallowed an item of $1,800 in the accounts of Norman J. Colman, Commissioner of Agriculture, on the ground that that amount was used in the purchase of seeds and labor and illegally charged to the appropriation for "Laboratory." This case is exactly similar to that of Commissioner Loring, Mr. Colman's immediate predecessor in office, whose accounts for purchases made in the same way were also disallowed. The explanation given by Commissioner Colman is that the seeds were purchased in his absence and without his knowledge by General Carmen, then chief clerk of the Department. The Comptroller, however, says the Commissioner is alone responsible under the law .... Farmers and others at Barrington, only about 16 miles distant from Chicago (and in the same county), have suffered of late to such an extent from prairie wolves that a bounty of $5 a head for each wolf slain is prayed for. The animals are reported to be bold and savage....Assistant State Dairy Commissioner M. A. Perry, of New York, is making things lively in Buffalo for grocers and other dealers in dairy products, who are charged with selling watered milk, oleomargarine for butter, and adulterated cheese. Over 200 cases of the sale of impure milk and 40 cases where bogus butter was alleged to have been sold are reported, and over 50 warrants have been issued for the arrest of dealers who are alleged to have sold bogus butter or adulterated milk. ....

An entirely new product, obtained from the distillation of petroleum, has been perfected by a chemist of Titusville, Pa., which he calls the Oriental potato bug powder. It is non-poisonous, harmless to man or animals, but the most destructive agent to insect life ever discovered ..... . Germany devotes 9,000,000 acres to the cultivation of the potato, the yield last year being 23,000,000 tons. Not only is the tuber largely used for food and in manufactures, but heavy exportations are made to other parts of Europe and to America.

The oleomargarine manufacturers met the other day at Philadelphia and formed a combination for the purpose of opposing a united front to all legislation hostile to their interests and to subscribe liberally toward the cost of contesting all laws restricting or hampering the sale of bogus dairy products .... The Maryland State Grange has just held its 13th annual session in Baltimore. It has, of course, long ceased to have political influence, and in fact, never in that State exercised much positive force. It was organized in 1873, and in 1876 arrived at its greatest growth. There were then 150 granges with a membership of 5,921. At present there are but 69 local organizations supported by 2,085 members. It is practically held together by the Commission Agency of the State Grange, by which members participate in the profits of all produce and mercantile transactions. This is a successful institution, and it is the intention to extend its scope. In 1884 the business transactions of this agency amounted to $362,000. It now has a surplus of $20,000. It is claimed that the price of fertilizers has been reduced 25 per cent. This agency does not undersell other houses, but at the end of the year divides the profits proportionately. Its influence socially and educationally is regarded as beneficial....

THE LARGEST CABBAGE GROWERS IN THE WORLD use and recommend Tillinghast's Puget Sound Cabbage Seeds. The disseminator of this renowned brand of seeds, in order to introdnce them into every county in the Union, has organized a Seed and Plant Growers' Association. One reliable party in each town is being enrolled as special agent, and is supplied with seeds in trade-marked packages, and also instruction books which will enable any one to grow cabbage plants successfully anywhere. Parties desiring seeds or plants, will, upon application, be furnished with the addresses of agents nearest them from whom they may be obtained.

This association thus furnishes one man in each town—the appointed agent—a good cash paying business in selling seeds and growing and supplying plants. There are still many excellent localities unoccuped, and any one so situated as to act as agent for this association should address, for particulars in regard to it, Isaac F Tillinghast, La Plume, Pa.—*Adv.*

Crops & Markets.

SATURDAY, Dec. 26, 1885

BRITISH dispatches say the average price of wheat in 187 towns in England and Wales last week was, 30s. 5d. per quarter, or 98⅜ cents a bushel. This is precisely the same as the lowest price touched at any time last year, namely, in the week ending Nov. 29, and last year's average was the lowest for more than a century. In England the average during the first half of this year was 33s. 1d. a quarter against 37s. 8d. last year, or $1.02¾ a bushel against $1.28 last year. Since the middle of the year the price has steadily declined, every month falling below the average for the corresponding month last year. Here, on the contrary, according to the last report of the Department of Agriculture, prices for wheat have this year been everywhere higher than last year; and for much of the time they have been higher at the seaboard than in England. The exports from this country have so far been too small to seriously affect prices in England; it is the heavy importations from India and Russia that have depressed the market. The amount of wheat raised in Russia is not large compared with that of some other grains; but as rye bread is used almost exclusively by the "common" people, a large proportion of that raised is exported.

According to the American Consul at St. Petersburgh the proportion of cereals cultivated in the Empire is as follows: Assuming 100 as representing the total production and export, the different varieties participate as follows: production: rye, 38·33 per cent.; oats, 31 per cent.; wheat, 12.67 per cent.; barley, 7 per cent.; other cereals, 11 per cent. Exports: Rye, 25.73 per cent.; oats, 17.22 per cent.; wheat, 39.97 per cent.; barley, 6.63 per cent.; other cereals, 10.45 per cent. The recent changes in the tariff of Germany and France have also lowered prices in Great Britian. Previously these countries imported a great deal of grain; but increase of import duties of late, has stimulated home production and greatly checked importation, so that the wheat, marketed in those countries formerly, is now thrown on the markets of Great Britian which lays no duties on cereal imports. Probably the chief cause of low prices, however, is the great depression of all industries in the United Kingdom. Poverty lessens consumption, and makes people have recourse to the cheapest kind of food, and hence the demand is less than usual while the supply is greater.

The importation of wheat and of flour as wheat into the United Kingdom for three months ended November 28 last amounted to 35,746,888 bushels, against 35,127,768 bushels during a like period in 1884, and as compared with 41,225,736 bushels for the quarter ending December 1, 1883.

The price of corn has fallen in sympathy with wheat, and also because the visible supply has increased. It is now 1,382,000 bushels. Oats have been only moderately well sustained. The decrease in the visible supply was 77,480 bushels as per the New York, and 90,288 bushels as per the Chicago report. There has been also a better demand for oats from abroad. The speculation in this grain has been light.

The visible-supply report in this city shows 612,236 bushels of wheat increase during the week, about 200,000 more than indicated by the Chicago report. In addition to this, cables from London and Liverpool show less disposition to buy than heretofore, and report larger stocks of wheat than at a like date last year. While the United Kingdom is ordering from India, Russia and Australia for future delivery, and ignoring our grain, it is observed that British imports during three months past have been slightly in excess of the like period in 1884, including flour as wheat.

Until early in the week the winter wheat belt was covered with snow, but then a thaw set in, and by Wednesday the snow disapeared nearly everywhere, leaving the wheat bare. A multitude of reports from every winter wheat State as far south as Tennessee, go to show that in Tennessee and Kentucky, the outlook is good, providing there is a covering of snow in the Winter; in Kansas and Missouri, seeding was late and dry weather caused a slow growth. In Southern Illinois, the great winter wheat region, the acreage is reported considerably smaller than usual. In Michigan the Hessian fly is troublesome.

The Michigan crop report for December 1 shows the condition of wheat in the southern four tiers of counties to be 94, and in the northern counties 96, compared with 100 as representing an average of years in vitality and growth. One year ago, the southern counties averaged 104, the northern counties 103. Condition of live stock one per cent. below an average. Reports from elevators in regard to quantity of wheat marketed indicate a total this season of 7,748,870 bushels, or 3,345,445 more than in 1884 for four months ending December 1. The report contains an article by Erwin F. Smith, of the University of Michigan, on the causes and nature of the potato rot, prevalent in that State.

Owing to the excellent quality of last year's Michigan wheat crop, large quantities have been sold for seed to other sections. In that State as well as in Indiana and Ohio, the ground is

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria,

bare and the crop looks well. Owing to the low prices of flour and the comparatively high price of wheat, and the greater popularity of Spring wheat flour, small mills in the Winter wheat section are shutting down, and the big ones are not in much better condition. The general impression among millers, railroad men, etc., at the West, is that farmers have marketed a larger proportion of their crops this year than at the same date last year.

The movement of new corn in Nebraska, Kansas, Iowa and Illinois is unusually small, as the late fine weather has favored the gathering of virtually the entire crop. It is thought that the scant receipts at the principal points are due to the great number of cattle and hog feeders who are loading up corn for winter and spring use at from three cents to four cents a bushel higher than the figures offered by dealers. There is a growing impression that the corn crop has been overestimated in quantity and quality.

According to the report of the Chicago Board of Trade last Tuesday, the following was the number of bushels of grain "in sight" in the United States and Canada on Saturday December 12, together with the increase or decrease the preceding week:

Wheat	58,388,469	Inc. 407,313
Corn	5,215,643	Inc. 710,246
Oats	2,440,064	Dec. 90,283
Rye	749,157	Inc. 10,247
Barley	2,197,384	Dec. 165,000

At the same time last year the visible supply was 42,000,000 bushels. The amount of flour in the hands of the dealers this year is also much larger than last.

At Philadelphia there has been very little activity in any branch of the trade. Wheat 1c. lower than last week under pressure to realize by speculative holders and continued lack of foreign demand. Corn is 1c. higher for December delivery. At St. Louis, Mo., all grains have declined and are unsettled. At St. Paul, Minn., wheat prices have at no time during the week fluctuated over 1c. during market hours, and the close shows a total variation of less than 2c., this being an advance over last week. The large dealers of the Northwest are now interested in holding the market steady, and are succeeding remarkably well so far. Stocks at Minneapolis are 6,350,113, at St. Paul, 1,232,009, and at Duluth, 5,016,068. The increase over last week at the three points is more than 1,000,000 bushels. It would have been larger but for the steady running of the mills. Deliveries in general are reported light: 13 flour mills have been running during the week, making an output of 96,000 barrels.

Prices of creamery butter have advanced, and the markets for prime goods are very strong. The receipts amount to 1,255,671 packages, against 1,227,701 packages for the same time last year.

	Dec. 23, '85.	Dec. 22, '84.	Dec. 23, '84.

State, new dairy fancy	25@29c.	23@25c.	24@27c.

There has been an improved demand for the export trade for fancy colored cheese, and prices have advanced. The receipts amount to 1,817,017 packages, against 2,147,855 packages for the same date last year.

	Dec. 23.	Dec. 24, '84.
Choice fancy State creamery,	9¼@10¾c.	12¾@12¾cs.,

The speculative market for hog products has been downward during most of the week. This was due to free receipts of hogs at the chief packing points, slight interest on the part of packers and others, the declines in prices of grains, to the embarrassment of a large English provision house, and a light export demand with no special reason for thinking an early revival in the shipping demand probable. Barreled pork ranges about $1 below the rate at a like date in 1884, lard about one-half cent per pound lower. It is thought prices will be stiffer towards the middle of January.

An Extended Popularity. BROWN'S BRONCHIAL TROCHES have been before the public many years. For relieving Coughs and Throat troubles they are superior to all other articles. *Sold only in boxes.*—Adv.

MARKETS BY TELEGRAPH.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]

Is the only Practical Preventive of the so-called Swine Plague.

It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.

AS AN EVIDENCE OF FAITH

in my remedy I make the following offer:

I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.

1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.

2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.

Facts are Better than Assertions.

Please read the following testimony:

GIBSONTON P. O., PA., Feb. 2, 1885.

Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*

Yours very truly, WHITE & CO.

[N. B.—White & Co., since writing the above letter, have purchased $4.50 worth of the remedy.]

The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

JOS. HAAS, V. S.

For the Young.

THE NEW YEAR.

ANOTHER year has gone—and Father Time
Has placed within his dusty desk with care
Another manuscript; and prose and rhyme,
Both good and bad are sadly mingled there.
And now we take another sheet as pure
As is an angel's wing, and grasp our pen
To write the New Year's tangled record, sure
That all our writing will confront us when
The wing of years shall blow the dust away,
And from Time's pigeon hole the Master's hand
Shall take our manuscripts all stained and gray,
And read them so that all may understand.
Then let us write with patience through the years,
Lest all our work be blotted out with tears.

[UNCLE MARK.

THE NEW LEAF.

THE first of the year is always quite an eventful time with most of us. We are generally advised to "turn over a new leaf"—to take a new start, and try to make the new year better in every way than the old. This is good advice and I feel sure that all the Cousins, yes, and their fathers and mothers too, are thinking about the way they would like to have their "new leaf" read. Now it seems to me that we should turn this leaf over very carefully. We don't want to tear it out by any means, and we don't the edges soiled, or the corners turned down. There are plenty of things that we would like to have taken away—no doubt about that, but I am going to believe that they are comparatively few by the side of the good things that we would gladly have remain. Now, before we turn this leaf over let us take a good look at it, and even have it fixed so that we can turn it back, if we like, for study. I believe my boys and girls have tried pretty hard to do what is right. If they have been naughty at times, I know pretty well how sorry they have been afterwards, and I hope that will be punishment enough for them. We are all going to try and make 1886 just a little the best year we have ever known. Suppose we each promise to hunt out 12 ways in which we can please mother, 12 in which we can please father and 12 more for each brother and sister. Did you ever think that in this way we can make over 100,000 happy hours? We can all do it I know.

"Time is up" on the bean reports and next week I shall give the names of the winners. They seem to be pretty well scattered about the country. Uncle Mark is sorry he can't give prizes to all those who tried so hard.

Are you going to keep a diary this year? I think it would be a good plan. It is pretty easy to write up the first few days, but after that, unless we are careful, the work grows a little tiresome. I should say, begin with a very few lines at first, and spend a few minutes every night in thinking over what you have done through the day. In this way you can think up many things that will be useful some time.

NEW COUSINS.

OUR family is growing. May Gardner lives in Massachusetts. She writes about a cat named Sambo and a great dog named Bravo. They have a pet pony named Kitty that will follow them about for an apple. I saw a horse the other day which would do all sorts of tricks for a piece of a potato.

GRACIE C. UFFORD lives in Ohio. She has a pet sheep with twin lambs. Her little calf is called Mollie Garfield. She has a little kitten, too.

MARY M. BORK raised some seedling potatoes which were very nice. Besides these, she raised onions, beans, cabbage and lettuce. She has 17 chickens and sold six last year.

GUY O. HAMMOND comes all the way from Colorado. He raised 30 chickens last year, but the skunks caught most of them. His papa raised 32 pigs.

NANNIE DOTSON lives in Indiana. She lives on a farm of 80 acres. Her mother has been sick for five weeks and Nannie has been doing all the work. How glad she must be to think she can do much.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: The frost killed my Lima beans before they got ripe; they were loaded with green beans. We had some very pretty flowers from the RURAL Garden Treasures, many of which we did not know the names of. In my last letter to you, I said some time I would tell you about the hens we keep; I will do so now. A year ago last Summer, we had 20 well-bred Plymouth Rocks, from one to three years old, which laid 1,945 eggs from March 1st to Nov. 1st, and they had but ordinary care. This season we kept 18 of last year's chickens, which laid in the same period of time, 1,645 eggs. Last June, Papa sent and got a setting of Wyandotte eggs and one of brown Leghorns. We got a pair of Leghorn chicks from the eggs, and eight Wyandottes, five of which were pullets, so you see we will have a variety for next year.

Your niece, MINNIE CRAIG.

Lapeer Co., Mich.

[The hens ought to have a premium I think. We shall want to know how the new ones do. U. M.]

DEAR UNCLE MARK: I took very good care of the Lima beans. I had 19, but we had an early frost here. As they did not ripen, I did not get any. I raised a nice little patch of pop-corn, and had some flowers. I hope Uncle Mark will not forget to tell us about his Mustang, for I love to hear stories. I go to school every day. There are not very many scholars there now, but there will be more when the winter term opens. We have a nice teacher; she teaches us to sing every morning. I have quite a distance to go. As it is so muddy, Pa has promised to let me ride one of our horses to school every day. She is quite small, so she will be nice. As there is a stable right by the school-house, she will have a nice place to stay during the day. I hope that Uncle Mark and the Cousins all had a nice Thanksgiving. Although it was so muddy we could not go to church, I had a very good time at home. We had all the pumpkin pie we could eat.

Windham, Ohio. ANNIE A. DAVIS.

[I shall surely tell the story. I am glad you are learning to sing.—U. M.]

DEAR UNCLE MARK: I am a girl 13 years old and wish to join the Y. H. C. Well, I will tell you how many turkeys we raised this year. We raised 60, and they look so nice. We have everything to make a home happy. Flowers and birds. We have 11 birds, and we have a bay window full of nice flowers. In the summer-time we have a large, round flower-bed full of Petunias. The brighter the sun the nicer they look. Uncle Mark, I would like to have you see our flowers; they are so nice; we have a Calla lily in bloom now. I can do all kinds of house work. We have a little rat dog; she is a little pet; when I go to hunt the eggs she takes hold of the bottom of my dress and follows me around. Ma and I put out a big row of strawberries; they are all alive. We had lots of pears this year, and not very many apples. My Pa has taken the RURAL two years. It has been snowing all day. Your niece,

Alexander, Ohio. ADA MOUNT.

[There must be plenty of music in your house. I am glad you have such a happy home.—UNCLE MARK.]

DEAR UNCLE MARK: We take the RURAL, and to say we like it, does not express our admiration for it. I am a farmer boy. Now you can better guess why it is that I want all the possible information poured in from all the ends of the earth. In view of what our fathers, grand and great-grandfathers have suffered from ignorance in farming, we are determined not to be cheated out of our precious rights, if perseverance fails not. After the pages have been written about our farming facilities, all is not told. We have vast water power for various machinery as well. For instance, my father owns one of the finest mill sites in the State, yet it has not been utilized in years. He offers it for sale, but I am more inclined to hold on and find a way some day, when I skip out of my teens, to make this wasting water turn a wheel that shall count units, tens, hundreds, thousands. I intended to have a chat with the Cousins, but I am such a new comer, and so backward in introducing myself, that you will please permit me to make my bow and retire, hoping to come again.

Jamison, Ala. KELLETT CAMPBELL.

[I am glad you came to see us. What a fine chance you will have some day to build up your State. There are hundreds of ways in which you can utilize that water power, at dairying, grinding grain, running a cotton gin, and still avoid the great noise and dust of a factory. Don't think there is nothing to be done in life but to make money, however. Build up a good character for the first thing. I am sure you will do that.—U. M.]

DEAR UNCLE MARK: I received the beans and let Mamma have them to plant. She planted them in May. They grew nicely, but the season was not long enough for them to ripen. I was very sorry. We have a white calf; we call her daisy. She was almost frozen to death when Papa found her. We brought her in the house. She staid in the house a week before the weather got warm enough for her to go to the barn. Her ears were frozen so that half of them came off; but it is a nice big calf now. My sister has a large white cat; his name is Pearl. He got to catching chickens this Summer. She wouldn't have him killed, so she kept him chained up like a watch dog until the chickens got big so he would not catch them. When she turned him loose he weighed 12 pounds. After we let him loose we saw him with seven rats in a very short time, and one day we saw him with four mice. Don't you think he is a noble cat? We have a little maltese kitten; his name is Frank. We have a large black dog; his name is Rover. Sometimes he goes with me to school; one day he stayed all day. We have two horses, their names are Frank and Fannie. I like Frank the best for I can ride on his back. If any one gets on Fannie's back she will kick up and try to throw them off. HENRIETTA CARRIER.

Sullivan Co.

[What a shame it was that Daisy suffered so. I hope you take the best care of her. That is surely a noble cat. He earns his own living—that is more than some men can say. No wonder you like Frank best. We all like good nature.—UNCLE MARK.]

DEAR UNCLE MARK: I would like to belong to the Y. H. C. We have been interested in the new Croton aqueduct all Summer, as we live about a mile from a shaft. They have been using a 500 horse-power engine and now they are putting in another of the same size. The shafts are from one to two miles apart, and worked out like a mine in both directions until they meet, This shaft is number 17, about 93 feet deep; they have thrown out a small mountain of broken rock. Brother Fred and I went down in the shaft on the elevator one day. We saw the men at work by the electric light. They use steam drills from two to eight feet long. The rocks are blasted by dynamite exploded by electricity, and they work night and day. Sometimes it is wet down in the shaft. The workmen take turns, ten hours in the wet, and 11 hours in the dry. They use about ten tons of coal a day. I will try to write again, but school takes most of my time. Yours truly,

WILLIE E. BENJAMIN.

Westchester Co., N. Y.

[Hope you will write again, Willie. I wish we could all go to see the work.

UNCLE MARK.]

DEAR UNCLE MARK: I am 12 years old. Two years ago this Fall pa said after the wheat was sown he would get me a paper. He sent and got the RURAL NEW-YORKER. I like to read the letters from the Cousins. I would like to join the Y. H. C. I planted all the seeds. Thinking this letter is getting too long I will close. Your nephew,

JOHN W. WORTHINGTON.

[Don't be afraid of writing too much, John. Uncle Sam will take much more than that for the same money. I am glad you can join us. —UNCLE MARK.]

DEAR UNCLE MARK: I should like to be one of the Cousins. I had a garden last Summer. I had two sun flowers, some beans, some potatoes and some radishes. I earned 75 cents last Spring making strawberry boxes for papa. I am nine years old to-day. I should like some of your Garden Treasures when they are ready. Your nephew, SHIRLEY WEEKS

Lyons, Wis.

[You will soon be quite a business man Shirley. I am glad you want to join —U. M.

DEAR UNCLE MARK: We are two little sisters. We enjoy reading the letters from the Cousins, and we would like to join the Y. H. C. Papa planted the Garden Treasures you sent him last Spring, but the woodchucks ate all the peas and beans when they first came up. The Rural Corn grew nicely, but none of the ears got ripe. We have for pets two kittens and four canary birds. We have picked up a good many bushels of apples this Fall, also walnuts and chestnuts, which we expect to enjoy next Winter. We would like to have you come and help us eat them. Well we must close for fear this will be too long

CARRIE & NELLIE CONVERSE.

Otsego Co., N. Y.

[Those woodchucks deserve to be killed. I wish I could come.—UNLCE MARK.]

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALCOM, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

EDWARD SUTTON, Eastern Agent, 300 Market St., Philadelphia, Pa.

PERSONALS.

BLAINE is interested in a new bonanza just struck near Leadville. Ex-Senators Chaffee and Tabor are associated with him.

AT a charity fair in Berlin the Crown Princess of Germany has been selling sausages at $35 apiece and sponge cake at $1 a slice.

CONGRESS has granted a pension of $5,000 a year to Mrs. Grant, and the President signed the bill so that the measure became a law before Christmas Day.

The late Marshal Serrano, of Spain, during his political career saw 84 changes of Ministry in that country, 40 rebellions and 12 changes in the head of the State.

POPE LEO is said to have an income of $1,500,000 annually, and it is stated on the authority of Monsignor Capel that the Pope's personal expenses are limited to $2.50 a day.

PRINCESS LOUISE and the Marquis of Lorne are preparing for Good Words an article on the Canadian Pacific Railway, the Princess contributing the pictures and Lord Lorne the letter press.

SENATOR HAWLEY, of Connecticut, has just paid $10, balance of a bill for his schooling, sent up from North Carolina the other day by his old schoolmaster, Mr. James Patterson, of Lumberton.

GENERAL SHERMAN remarked recently to an interviewer: "Now, look here, there's been enough written and said about General Grant to give him his proper place in history. You might as well question the greatness of Washington."

WHEN the King of the New Zealand Maoris was in England he promised to work for temperance reform among his people. He seems to have kept his word, for it is now announced that more than 11,000 of his subjects wear the blue ribbon of teetotalism.

"THE dramatic incident of my life," said Robert Garrett the other day, "was the sudden death of Vanderbilt in my presence. I shall never forget it. It came like a fearful dream, and so swift was the change from life to death that it could scarcely be realized."

MR. BERGH is opposed to inoculation for hydrophobia. He thinks a better, surer remedy than M. Pasteur's virus is vapor baths. He knows of cases in which the patient has had the poison sweated out of him be this means.

MISS MAY ENDICOTT, the only daughter of the War Minister, is very English in appearance. She drives in a drag with a London coachman in the front seat, and wears a close-fitting suit of blue flannel, with cap to match, and poses *a la* Langtry. She has a brilliant color in cheeks and lip, and resembles, only she is fairer, the famous Jersey beauty.

MR. E. A. WALKER, the statistician of the New York Produce Exchange for more than 16 years, will leave the Exchange on the first of February and will be succeeded by Mr. J. C. Brown, who has been connected with the Bank Department at Washington, and who will work for $3,000 a year, $1,000 less than his predecessor got. Much discontent in the Exchange.

JOAQUIN MILLER is spending the Winter in Washington, engaged in literary work. He has an intense hatred of dogs. A visitor who recently called upon him was accompanied by a large English mastiff. "Take that beast out!" exclaimed Miller, furiously. "There was but one nation (the Greeks) that knew how to properly treat a dog, and they put him at the gates of hell."

DURING the last year Messrs. Armour & Co., of Chicago and Kansas City, killed a little over 1,100,000 hogs and 300,000 cattle. They have on their pay-roll at the stock-yards 4,000 men, and during the winter season frequently exceed that number. Their capacity for slaughtering hogs at their packing-house in Chicago alone is 12,000 per day, their usual run being about 5,000 hogs per day.

LORD TOLLERNACHE, now in his 80th year, is the model English landlord. His estate of 46,000 acres in Cheshire has been cut up into farms averaging 200 acres each, because he thinks a family couldn't do well on a smaller holding. He has built or rebuilt from 50 to 60 farm houses at a cost of $740,000, each costing $14,000, and in addition he has built 200 cottages for laborers. During all the recent agricultural distress he has had neither a vacant farm nor a tenant in arrears.

THE RURAL NEW-YORKER

The great national standard of Rural Journalism. It is the accepted medium for the introduction of all New Plants, Seeds, and farm implements. These are tested regardless of cost at the Rural's Experiment Grounds of 300 acres. Its Free Seed and Plant Distributions have popularized many of the most valuable varieties in cultivation. It is original from beginning to end. It employs the best writers in the world. It is the first journal to have established Experiment Grounds; the first to present careful and original illustrations of plants of all kinds, of cattle, farm and garden helps, poultry, large and small fruits, grapes, and everything appertaining to rural life. Over 500 engravings yearly. Over 600 writers. It is edited by practical farmers. It combines the best features of the daily and weekly press with all that can instruct, elevate and interest the rural home. It costs more to publish than any other weekly in America. It is for the North, South, East, West. The ablest farm and garden weekly in the land. It is pure, trustworthy, sparkling, alive, independent, and faithful. It exposes all frauds. It answers over 5,000 questions in its Farmers' Club. Free specimen copies will give a full account of its present Free Seed Distribution, and of the sterling presents offered for clubs. We want you to KNOW that the Rural New-Yorker is the best journal of its class published. It will help you to make money and to spend it judiciously. Fine paper, 16 pages, $2.00 a year. Subscribe now. Address the Rural New-Yorker, 34 Park Row, N. Y.

Humorous.

"So the missis is to be married, eh?" said the gardener to the cook. "Yis; and in illigant stoyle, too. She's goin' fer to have a dhress thray yarruds long, and four pall-bearers ter kerry it.'

A GENTLEMAN bought a newspaper, and tendered in payment a piece of 40 sous. The newspaper woman; "I haven't the change; you can pay me as you pass along to-morrow." The gentleman: "But suppose I should be killed to-day?" The newspaper woman: "Oh, it wouldn't be a very great loss."

A SIMPLE-HEARTED and truly devout country preacher, who had tasted but few of the drinks of the world, took dinner with a high-toned family, where a glass of milk punch was quietly set down by each plate. In silence and happiness, the new Vicar of Wakefield quaffed his goblet, and then added: "Madam, you should daily thank God for such a good cow."

"Do I love George," mused Clara, softly, "or is it simply a sister's affection that I feel for ——" Just then Bobby rushed noislessly into the room and interrupted her sweet meditations. "Get out of here, you little brat!" she shouted, and seizing him by the arm she shot him through the door. "Ah no," she sighed-as she resumed her interrupted train of thought, "my love for George is not a sister's love. It is something sweeter, purer, higher and holier."

"I WANT a lawn mower," said a citizen yesterday, as he stepped into a hardware store, "Any special kind you prefer?" inquired the dealer. "No; I don't know much about lawn mowers myself, but I want the noisiest one that's made. I've got a darned mean neighbor, whose children worry the life out of me with their whooping and yelling every night till ten o'clock. I want a mower that can discount the tannery whistle, and I'll whoop it up every morning from four o'clock till breakfast, and wake up the rats. When night comes they will be sleepy enough to go to bed at a decent hour." A machine was picked out. "Never mind the oil-can," said the citizen, as the merchant began to tie one to the handle. "I ain't going to use any oil. Noise is what I'm after."

JOHNNY DID NOT GET A CHRISTMAS SLED.

SILVER CREEK, N. Y., Feb. 6, 1880.
GENTS—I have been very low, and have tried everything, to no advantage. I heard your Hop Bitters recommended by so many, I concluded to give them a trial. I did, and now am around, and constantly improving, and am nearly as strong as ever.
WILLIAM H. WELLER.
MONROE, MICH., Sept. 25, 1975.
SIRS—I have been taking Hop Bitters for inflammation of kidneys and bladder. It has done for me what four doctors failed to do. The effect of Hop Bitters seemed like magic to me. W. L. CARTER.

THE GREAT AMERICAN TEA COMPANY
GOOD NEWS TO LADIES.
Greatest inducements ever offered. Now's your time to get up orders for our celebrated Teas and Coffees, and secure a beautiful Gold Band or Moss Rose China Tea Set, or Handsome Decorated Gold Band Moss Rose Dinner Set, or Gold Band Moss Decorated Toilet Set. For full particulars address
THE GREAT AMERICAN TEA CO.,
P. O. Box 289. 31 and 33 Vesey St., New York.

CIDER MAKERS Should send for our New 1885 Catalogue, mailed FREE
Boomer & Boschert Press Co., Syracuse, N. Y.

MOORE'S EARLY GRAPE.
We have reserved a limited quantity of well ripened wood of Moore's Early Grape which we can offer by the 1,000 eyes and upwards at a reasonable price. Orders must reach us soon to receive attention.
JOHN B. MOORE & SON,
CONCORD, MASS.

Heebner's Patent Level-Tread Horse-Powers.
WITH PATENT SPEED REGULATOR.

Heebners' Improved Threshing Machine. Fully warranted. Catalogues with valuable information Free. Sole owners of Level-tread patents. All others infringements. Heebner & Sons, Lansdale, Pa.

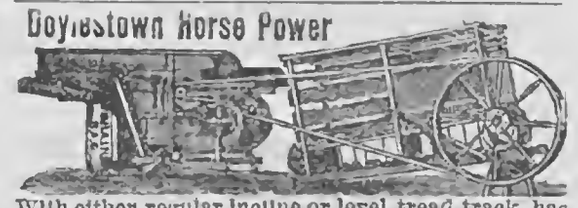
Grind your own Bone, Meal, Oyster Shells, GRAHAM Flour and Corn in the $3 HAND MILL (F. Wilson's Patent). 100 per cent. more made in keeping poultry. Also POWER MILLS and FARM FEED MILLS. Circulars and Testimonials sent on application. WILSON BROS., Easton, Pa.

Buy the Best. THE EUREKA
Awarded FIRST Premium and Gold Medal at World's Fair New Orleans, over 12 leading Wind Mills. The EUREKA, after a trial lasting 4 mos. was pronounced the best over all and to-day stands at the head of all competitors. Sizes, 10 to 18 ft. diameter of wheel, either for Pumping or Power Mills. *Perfect in all parts and warranted.* Estimates on application. Also Mfrs. of the Adams Direct Draft Barn Floor Horse Power. *Live Agents Wanted.* Address Mfrs.,
SMITH & WOODWARD, Kalamazoo, Mich.

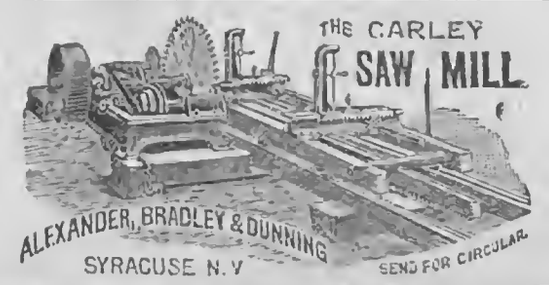
A SAFE FAMILY REMEDY.
ESPECIALLY SUITED FOR
BABES,
CHILDREN AND DELICATE PERSONS.
TROPIC FRUIT LAXATIVE
Entirely harmless and delicious to take. Tropic Fruit Laxative is unequalled for Constipation, Biliousness, Sick Headache, Loss of Appetite, Complaints of Children, and liver, stomach and bowel ailments generally.
Absolutely safe for delicate and nursing women. Taken eagerly by infants and children.
Ask for Liquid Tropic-Fruit Laxative. Price 25 cents per bottle. *Sold by Druggists.*

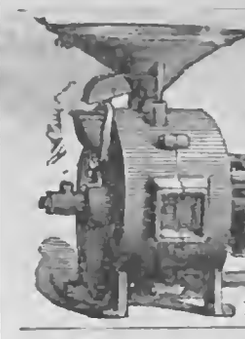
Clydesdale and English Shire Horses.

The only stud in America containing the very best specimens of both breeds. Prize winners at Chicago Fair, the World's Fair at New Orleans, the Royal Society of England, etc. Large importation arrived August 12, and more to follow. Our buying facilities being unequalled, there is no such opportunity offered elsewhere, to procure first class animals of choicest breeding at very lowest prices. Every animal duly recorded and guaranteed. Terms to suit all customers. Catalogues on application.
GALBRAITH BROS., Janesville, Wis.

Doylestown Horse Power


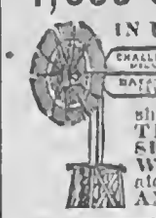
With either regular incline or level tread track, has the simplest and most efficient governor made. The Doylestown Junior Thresher and Cleaner has no superior. For Illustrated Catalogue address sole manufacturer, DANIEL HULSHIZER, Doylestown, Bucks Co., Pa.





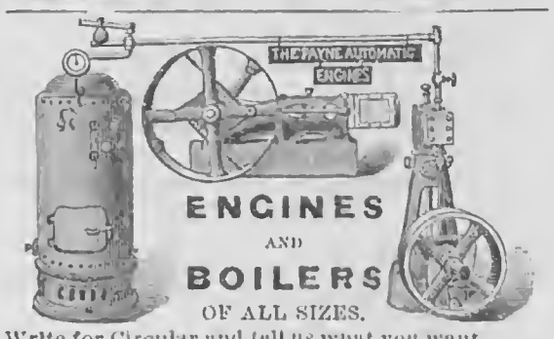
The Edward Harrison MILL CO., Manufacturers of HARRISON'S STANDARD GRINDING and FLOURING MILLS of all sizes and varieties for Steam, Water, Wind, Horse & Hand Power. Possessing great capacity and durability. Every Mill warranted to do just what we claim for it. Write and enclose a 3ct. stamp for our new 80 page illustrated catalogue and mention this paper. The Edw. Harrison Mill Co., New Haven, Ct.

7,000 CHALLENGE WIND MILLS.

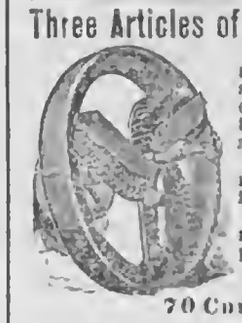


IN USE IN EVERY State and Territory of the U. S. It is a sectional wheel, has been made by us 15 years, and has never blown down without tower breaking, a record no other mill can show. MILLS SENT ON 30 DAYS TEST TRIAL. BEST FEED MILLS, CORN SHELLERS, ETC. GOOD AGENTS WANTED in all unassigned territory. Catalogues free. CHALLENGE WIND MILL AND FEED MILL CO., Batavia, Kane Co. Ill.

CORN MILL.
Best Corn and Cob Grinder in the World.
ENGINES AND BOILERS OF ALL SIZES.
Send for Catalogue
COMMON SENSE ENGINE CO., Springfield, Ohio.



ENGINES AND BOILERS OF ALL SIZES.
Write for Circular and tell us what you want.
B. W. PAYNE & SON, Drawer 1005, ELMIRA, N.Y.
or address our New York Office.
Eastern Agents, HILL, CLARKE & CO., Boston, Mass.
Our patented Vertical Boiler will not prime. No danger of burning flues.

Three Articles of Great Value to the Farmer.


1. Dick's Cornstalk Cutter and Splitter.—Prepares stalks so that every particle will be eaten with a relish. The cut shows the large fly-wheel, with knife and slitters.
2. Triumph Steam Generator. For Cooking and Steaming Food for Cattle.
3. Griffing's Corn Sheller and Separator.—The most perfect Sheller in the market.
Send for Circular.
H. B. GRIFFING,
70 Cortlandt Street, New York.

SPAIN'S CHURNS. Star Churns, Rapid Ice Cream Freezers, Improved Tree Tubs, all made of CEDAR. Send for illustrated circular and prices. Clement & Dunbar, Philadelphia, Pa.

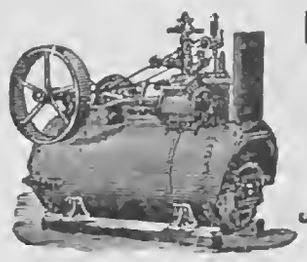
FISH SEINES

Large Ill. Catalogue free. Address Great Western GunWorks, Pittsburgh, Pa.

A beautiful work of 150 pages, Colored Plates, and 1000 Illustrations, with descriptions of the best Flowers and Vegetables, prices of SEEDS and Plants, and how to grow them. Printed in English and German. Price, only 10 cents, which may be deducted from first order. It tells what you want for the garden, and how to get it instead of running to the grocery at the last moment to buy what seeds happen to be left over, meeting with disappointment after weeks of waiting.
BUY ONLY VICK'S AT HEADQUARTERS. SEEDS, JAMES VICK, SEEDSMAN, Rochester, N. Y.

HOLSTEIN-FRIESIAN CATTLE!

ALL AGES AND BOTH SEXES. HOME-BRED AND IMPORTED.
Cows and Heifers Bred to best Netherland and Aaggie Bulls.
The average Records of a Herd are the true test of its merit.
The following Milk and Butter Records have all been made by animals now in our Herd:
MILK RECORDS,
Five Cows have averaged over 19,000 lbs. in a year. Ten Cows have averaged over 18,000 lbs. in a year. Three Cows have averaged over 20,000 lbs. in a year.
We know of about 30 Cows that have made yearly records exceeding 16,000 lbs., and 14 of them are now in our Herd and have averaged over 17,500 lbs.
Twenty-five have averaged over 16,000 lbs. in a year. Sixty-three, the entire number in the Herd that have made yearly records, including fourteen 3-year olds and twenty-one 2-year olds, have averaged 12,785 lbs. 5 ozs. in a year.
BUTTER RECORDS.
Five Cows have averaged 20 lbs. 7 ozs. in a week. Nine Cows have averaged 19 lbs. ½ oz. in a week. Fifteen Cows have averaged 17 lbs. 6 ozs. in a week. Six 3-year olds have averaged 14 lbs. 3 ozs. in a week. Eleven 3-year olds (the entire number tested) have averaged 13 lbs. 2 ozs. in a week. Six 2-year olds have averaged 12 lbs. 1⅓ ozs. in a week. Fifteen 2 year olds (entire number tested) have averaged 10 lbs. 8 8-10 ozs. in a week. The entire original imported Netherland Family of six cows (two being but three years old) have averaged 17⅔ lbs. in a week. This is the Herd from which to get foundation stock. Prices low for quality of Stock.
SMITHS, POWELL & LAMB,
LAKESIDE STOCK FARM, SYRACUSE, N. Y.



BOOKWALTER ENGINES
UPRIGHT AND HORIZONTAL,
3 TO 10 HORSE POWER.
OVER 3,000 IN SUCCESSFUL OPERATION.
Illustrated Pamphlet sent free. Address,

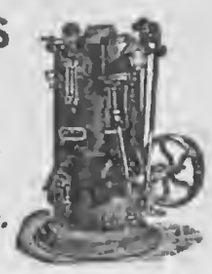
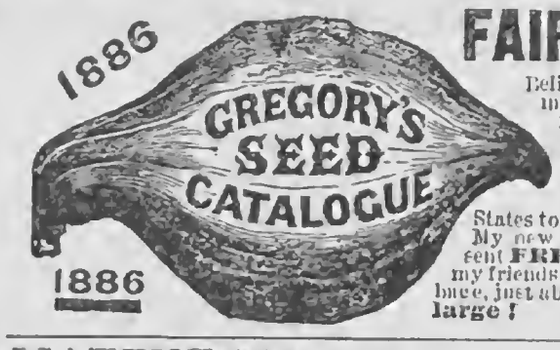
Eastern Office: 110 Liberty St., New York.



AGENTS WANTED FOR THE PICTORIAL COMPLETE STOCK-DOCTOR
Embracing Horses, Cattle, Sheep, Swine, Poultry, Bees and Dogs. By Hon. J. Perham and Dr. A. H. Baker, V. S. Covers every subject pertaining to Stock of Farm both in Health and Disease. Two charts for telling ages of Horses and Cattle; 720 Engravings and 14 Colored Plates. Farmers clear $100 a month. ACT NOW! Exclusive Territory. Book absolutely without Competition. For Confidential Terms and "Extracts from Agents' Reports," etc., address N. D. Thompson Pub. Co., St. Louis, Mo., or New York.

GRAPE VINES Niagara, Empire State, and all the best varieties. Low prices for first-class stock. Jewell, Parry, May King, etc., STRAWBERRIES (several varieties $2 for 1000). New and Old RASPBERRIES, BLACKBERRIES, &c. Plants by mail a specialty. Descriptive Catalogue, with colored plates, Free; contains $1, $2, $3 and $5 collections, and instructions for planting. JOEL HORNER & SON, Merchantville, N. J.



FAIR AND SQUARE DEALING.
Believing that if a man has dealt squarely with his fellowmen his patrons are his best advertisers, I invite all to make inquiry of the character of my seeds among over a million of Farmers, Gardeners and Planters who have used them during the past thirty years. Raising a large portion of the seed sold, (few seedsmen raise the seed they sell) I was the first seedsman in the United States to warrant (as per catalogue) their purity and freshness. My new Vegetable and Flower Seed Catalogue for 1886 will be sent FREE to all who write for it. Among an immense variety, my friends will find in it (and in none other) a new drumhead Cabbage, just about as early as Henderson's, but nearly twice as large! James J. H. Gregory, Marblehead, Mass.

MATTHEWS' SEED DRILL.
Hand Cultivator, Wheel Hoe,
SINGLE OR COMBINED.

Admitted by leading Seedsmen and Market Gardeners everywhere to be the most perfect and reliable implements in use for planting and cultivating garden crops. *Beware of cheap Imitations!* Inquire for the genuine machines which are made only by

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XLV. No. 1876. NEW YORK, JANUARY 9, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Herdsman.

JERSEY BULL, DUKE OF KENESAW NO. 11959.

IN Fig. 11 is shown the Jersey Bull Duke of Kenesaw, the property of Mr. J. I. Chamberlain, Marietta, Georgia, and generally considered the finest bull of the breed in that State. His sire was the Earl of Logan 6,179, and his dam Maggie of the Grange 8323. He was dropped January 17, 1883, and weighed 11,130 pounds on August 3. Jerseys are very popular at the South, where quite a large number have been introduced, especially into Kentucky, Georgia, Mississippi and Texas. The genial climate of that section suits them admirably, being not unlike that of their native island, especially in the northern tier of States.

A COW THAT PAID.

ON October 15, 1884, I purchased one of the most promising of 16 cows. She had a fine Flanders escutcheon of the first order, a square and well-spread udder, and large milk veins. The only objection to her was that she was too small, weighing only 900 pounds on December 4, 1885. She had been giving milk since March 1884, as I understood, and from October 15, 1884, to April 8, 1885, when dry, she gave 2,150 pounds, that sold for $22. May 14, 1885, she dropped a calf, which I sold for $1.50, as she had been bred to a poor bull. From May 14 to October 15, 1885, she gave 4,024 pounds of milk, that sold for $21.37. This was a total of 6,174 pounds of milk for one year, that sold for $42.87. Add to this the value of the skim milk, 4,040 pounds, at, say, 20 cents per 100, and we have the total value of her milk to be $52.71. Suppose, now, that at the end of the first year I had sold her to the butcher for 2½ cents per pound, or $22.50, I would have remaining, after paying interest at eight per cent., $28.21, with which to pay for feed and labor. Now, it costs not more than $16 per year to feed such a cow, and there remain $12.21 to pay the labor of milking. In addition, we have also the value of the manure, which in Iowa is no small item.

The problem is quite different when considering her milk yield for five years and distributing the loss by selling for beef to each year. This would amount to only $5.22 per year, and leave a net profit of about $23.59 after deducting all expenses that have occurred.

There are many cows in this and other localities weighing 1,000 pounds and selling for $30 to $25, that will not give over 4,500 pounds of milk per year. They require just the same attention and feed and barn room as a good cow, and figures will show that they are not the cows that pay for three or five years.

Jesup, Iowa. J. N. MUNCEY.

Sheep Husbandry.

Notes from the Rural's W. N. Y. Farm

DOWN MERINO *vs.* MERINO DOWN.

WE suspend the consideration of the regular division of our subject this week, to notice a criticism made by the Michigan Farmer on our remark that, "all things considered, the Down Merino was the ideal lamb for winter feeding," in which our respected contemporary says that "the Down sheep puts its fat on the outside next the skin," and that "while every one admires a fat carcass of mutton, but few want to buy it," and that a "cross-bred Merino-Down will give a more salable carcass than even a pure-bred Down." That the writer of these quotations has had no experience in feeding or marketing lambs, and that he is so anxious to show his smartness as to do so at the exposure of his ignorance, is shown by the utter falsity of each of the statements we quote. It is a fact that long-wool sheep do put their fat on the surface, both inside and outside, in excessive abundance, while their meat does not contain enough to give the beautiful marbling so much sought; and that the lean in their carcasses is in unduly small proportion. But the Downs, and particularly the South Downs, are everywhere the ideal of a perfect mutton sheep, and unless excessively fattened, the fat is finely mixed through, and with the lean in the most perfect proportions, beautifully marbling the same, and while the carcass is nicely coated with fat, it is never so in excessive proportions. This is the unanimous testimony of every author on sheep husbandry, and is shown by every Christmas market in this country.

That people do admire fat mutton and buy it as well, is proven by the fact that in New York and every other market, the fat carcasses always sell first, and at a price several cents per pound higher than the lean. Even the very fat carcasses of long-wool sheep sell for an extra price over the lean ones. It may be, and no doubt is, a fact that such meat is not so profitable for the consumer, and that a larger proportion of it is thrown away; but what care we who produce the meat, what becomes of it after it passes out of our hands and we have the money for it? We feed lambs for the profit, and a difference of two or more cents per pound makes a great difference in our profits, and so long as those people with abundance of money prefer it, and are willing to pay for it, we say, let them have it; even if it were a fact that the Downs were *all fat*. But this last proposition is the most mischievous of all, and will work utter failure and loss to any who read and may be induced to follow it. While we advocated the Down-Merino cross as the best for producing feeding lambs, we did not claim for such, the production of a grade of meat superior to the pure Down. Such would not be the case, as no better mutton can be produced, or desired than that grown inside of a *pure Down skin*. It was other considerations, as then stated, that led us to recommend that cross as the "ideal lamb."

But a Down-Merino and a Merino-Down are very distinct crosses and produce very different results. While the use of the Down male on the Merino female (a Down-Merino cross) would give a quick-growing, large-bodied, short-legged, hardy, heavy-fleeced and long-wooled lamb, having a mother that will give more and better milk for her size and for the food consumed than any other; the use of a Merino male on a Down female (a Merino-Down cross) would give a lamb with directly the opposite characteristics, and the mother will be found a comparatively indifferent milker, more inclined to grow and fatten herself than to force the lamb to do so. We have tried both these crosses, and know from personal experience the worthlessness of the latter. As poor as we regard full-blood Merino lambs for winter feeding, we should much prefer them to those bred by such a cross, and our friendly contemporary, if it really regards the success of its readers, should hasten to correct its statements, and advise them under no circumstances, to ever make a "Merino-Down cross."

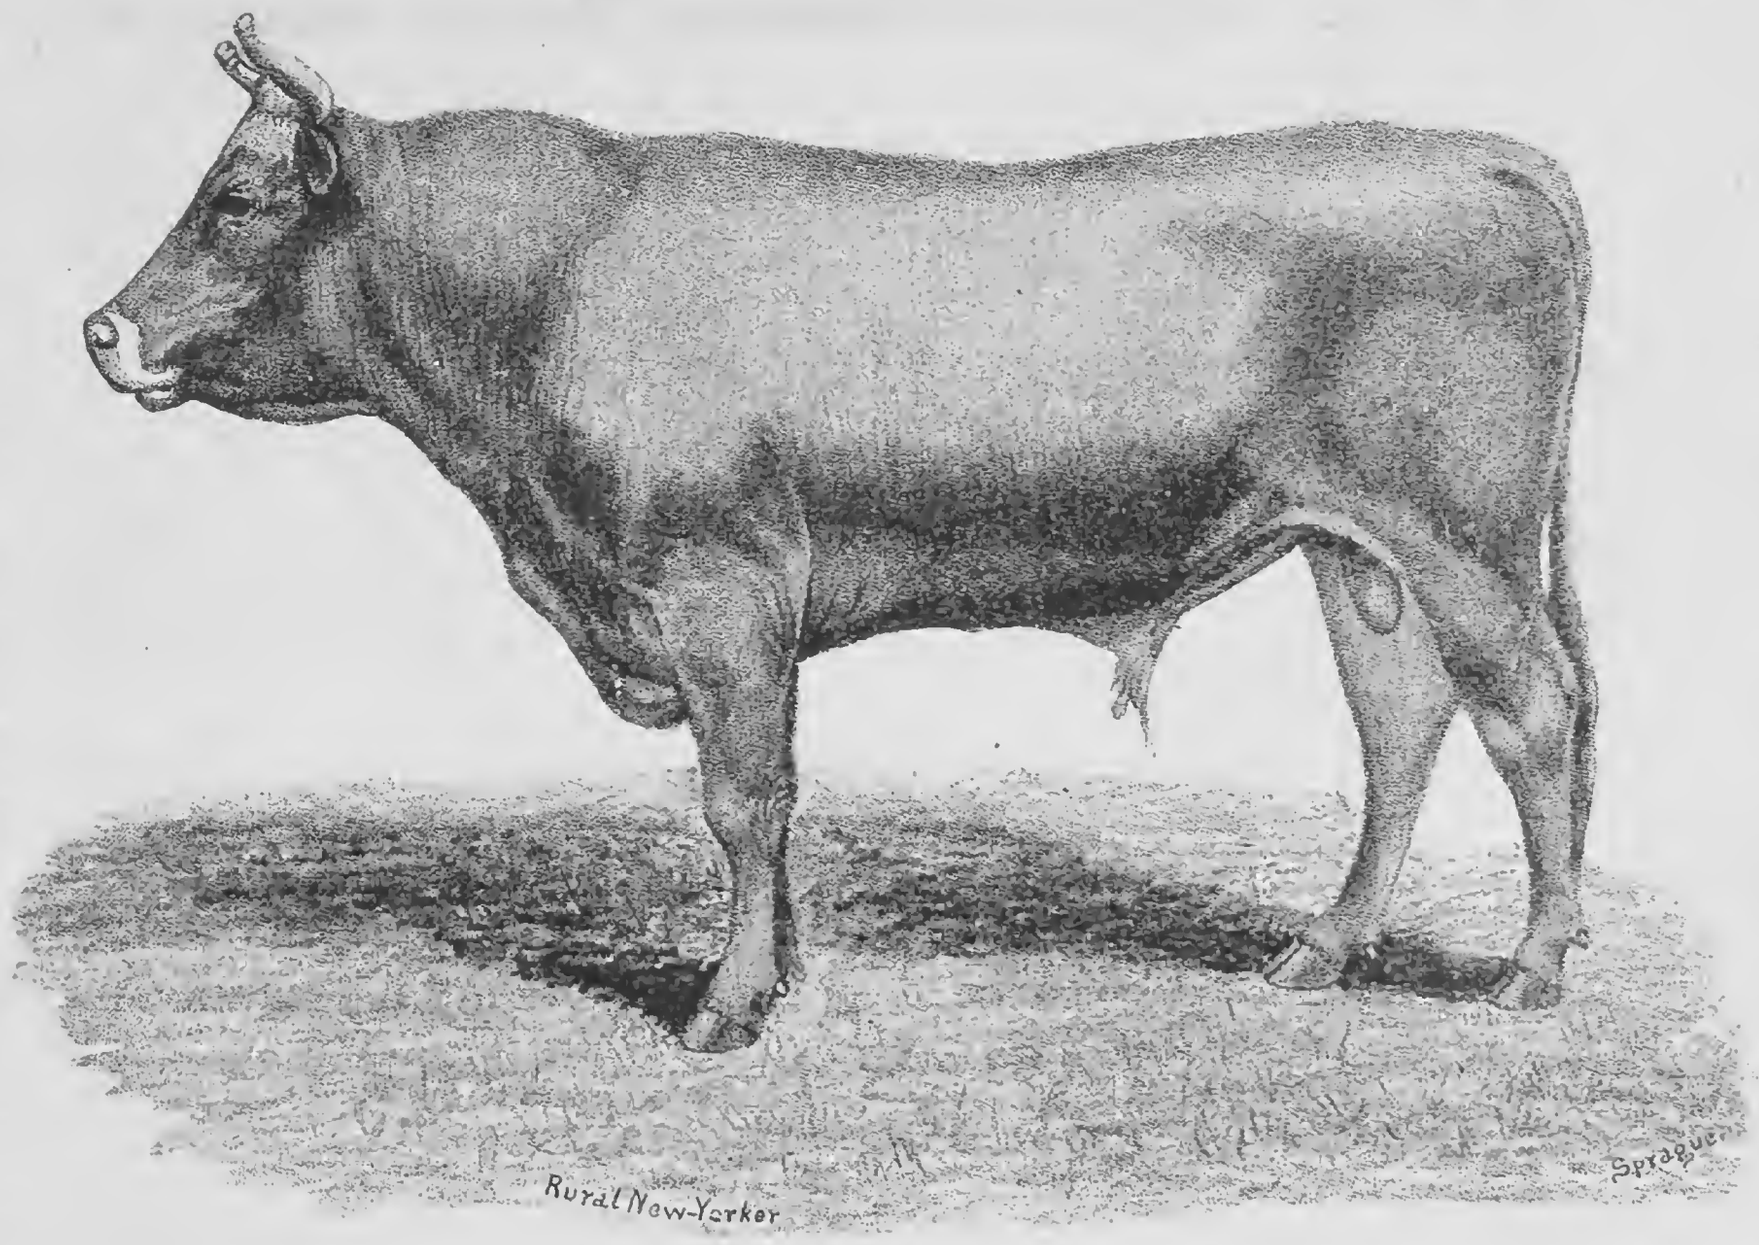
JOTTINGS.

We had a field of corn planted with purchased seed, which for some reason did not come up well, and as a consequence, the frost caught it before it was fully ripe. We fed these stalks with the soft corn to the cows, and feed what we would with them, there was a taste to the butter, which we could recognize and which we did not like, and since we changed to good clover hay, and mangels in place of the corn-stalks, there is a marked change in the butter.

We are satisfied that there is no better food for the production of gilt-edged butter than mangels or carrots and plenty of bran, oil meal and corn meal with early-cut, well cured clover hay. You can almost smell the fragrance and taste the nectar of the clover blossoms.

Our sheep were never doing better. The lambs are now dropping lively and some of the older ones are ready for the market as soon as we think it best to send them.

Oil meal is cheaper this Winter than we ever knew it before, and we wonder our farmers do not feed every pound of it, keeping it at home to fertilize our farms instead of letting hundreds of tons every week go abroad to enrich the farmers and the fields of Great Britain.



JERSEY BULL, DUKE OF KENESAW, 11959. Fig. 11.

Dairy Husbandry.

SALT AND SALTING BUTTER.—NO. 3.

Faulty method of salting; the proper way; treatment of the salt.

T. D. CURTIS.

IN previous articles we have spoken of the

desirable qualities and pointed out the objectionable features of salt for dairy purposes, referring also to the evils of carelessness in handling, whereby dirt and foul odors are imparted to it. We now come directly to the operations of salting dairy products. The usual method has been to take butter out of the churn, place it upon the worker, give it a thorough cutting, rolling and rubbing to get out the butter-milk, then to sprinkle on the salt and to proceed as soon and as rapidly as possible with the work of grinding it into the butter. After the strength of the operator was exhausted, the butter was set aside for 24 hours for the salt to dissolve, and then the butter was given another working to get out the surplus brine! If the salt happened to be fine, even-grained and freely dissolving, a large proportion of it was run away in the brine, and then it was charged with lacking the requisite strength, or accused of dissolving too easily and wasting! The butter—well, the butter was made into grease, which might be tolerably palatable, if immediately consumed, but quickly parted with its volatile flavoring oils, or had them converted into offensive compounds by uniting with the gases of the atmosphere! And even now there are those stupid enough to talk about the waste of salt by its dissolving too quickly, when in fact this is a most desirable quality. But there are those who know better, and dairymen who practice a more desirable method of salting their butter. Since the adoption of the practice of not gathering the butter in the churn, but leaving it in a granular condition—some say as fine as wheat, and others as fine as mustard seed—the problem of getting out the butter-milk and salting the butter has been much simplified.

The butter is now generally washed in the churn by pouring in cold water—which should be as low as 55 degrees, if not 50—agitating the churn a little and then drawing off the water. This process is repeated until the water runs clear, and if one washing is in weak brine it will greatly aid in freeing the butter from caseous matter. After washing, let the water drain off sufficiently, which it will generally do in half an hour or so, sprinkle on the salt and stir it in gently with a ladle or by gently turning the churn. At the temperature of 55° or below, the butter will not pack, so the salt—especially if it freely dissolves and becomes brine—can easily be worked into the butter in a very few minutes. There is no grinding, crushing lever-moving over the butter, but sweet brine, aided by the stirring and capillary attraction, penetrating all through the mass, and covering every particle, however minute. As soon as the salt is dissolved, the butter is evenly salted as no amount of lever working could do it with undissolved salt, or with the butter gathered into a solid mass. Butter so salted into the granular condition may be at once taken from the churn, and packed directly in the tub, the packing pressing it together in a close body. Or it may be taken on to a worker, and gently, very gently, pressed together and then packed. No second working is required, and it is already as evenly salted as it ever can be, and a second working is even more disastrous to the texture than the first working. After the butter has once settled together and become "set," as it were, like mortar, working it rapidly deteriorates it and makes it oily, which injures the keeping quality, and hastens the time when it gets "off flavor."

The foregoing is feasible in small dairies, In large dairies and factories, it might be difficult to salt in the churn or stir in the salt as directed. But the process of churning and washing may be the same in all cases. Where there is a large amount of butter—well cooled down, of course—it may be scooped out of the churn and placed on the working table, there spread as evenly as possible, and the required amount of salt sprinkled on. Then take a rake—a smooth, common hay-rake is good enough—wet it first in hot, then in cold water, and proceed to rake in the salt by beginning at one edge, and carefully drawing a small amount of the granules toward you just a little. Then reach out and take a little more, thus proceeding until the whole mass has been gone over. Next, begin on another side and repeat the operation, continuing the stirring until the work is done. It will not be a difficult task to decide when the salt is all dissolved and sparkling in the form of brine on every particle of butter. The work is now completed and the butter is ready for the tub. It is a matter of little consequence whether it is first pressed together and then packed, or the pressing together is done as the packing goes on. If first pressed together, let it be carefully done without working. In this way, perfect grain and even salting are secured; and if the rest of the work is perfectly done, perfect butter is the result.

Too much attention cannot be given to every operation in butter making, and salting is one of the most important.

NEW YORK STATE DAIRYMEN'S ASSOCIATION.

Composition of milk; puzzling experiments at the New York Experiment Station; influence of soil on milk; milk a perfect food for infants only; evils of unclean stables; stable floors; need of pure-bred bulls; influence of food upon milk; skim cheese; work of the Dairy Department; dairy management.

[RURAL SPECIAL REPORT.]

THIS association met in annual convention, at Jamestown, on the 15th, and closed its sessions on the afternoon of the 17th of December. After the preliminaries, Prof. J. T. Edwards read a paper on the composition of milk. It is a mixture of liquid and solid compounds, extremely sensitive to outside influences. Only about one-half of one per cent. of the mineral portion of it is derived from the soil. The rest is elaborated from the atmosphere through the plant food of the cow and her own organism. It used to be considered a product of vital chemistry, but its constituents are so well known now, that the chemist can produce a very close imitation of it. During the siege of Paris by the Germans, artificial milk was produced for the use of infants. It was composed of 87 parts of water, four parts of olive oil or horse fat, four parts of sugar, four parts of egg albumen or gelatine, one half part of common salt, and one half part of carbonate of soda. This sustained the lives of the little ones fed on it. This is more than can be said of some of the milk sold in our cities. Immature corn-stalks the Professor considered very objectionable feed for milch cows. He had noted that bowel complaints and mortality among infants prevail at the season when dairymen are soiling with sowed corn. Immature corn-stalks are bad, whether fed green, cured, or ensilaged. They do not digest well, and produce a feverish product.

Dr. E. L. Sturtevant said he knew less about milk than he formerly supposed he did. Four years of experiment, at the Station, with contradictory results, only point the way for further investigation, without reaching any definite conclusions. He has found that bacteria, one way and another, play very important parts in the conduct of milk. He had fed putrid food without any apparent results, and had been greatly perplexed with milk produced from sound food and under what were supposed the best conditions. But examination showed there were bacteria floating in the atmosphere of the stable, and these were traced to some decaying matter that had escaped observation. He found the same results in the milk product, from feeding four pounds of corn-meal per day with hay, that he did from feeding 40 pounds of turnips with hay, but in the latter case more hay was consumed. He has found that artificial digestion of foods corresponds very closely with the costly German experiments in feeding, and hopes soon to furnish the farmers reliable feed tables indicating the value of different foods. But there is great variation in animals; and the same feed and care do not always produce like results with the same animal. One cow will drink 150 pounds of water daily, while another cow, standing by her side and treated in the same manner, will drink only 40 pounds. He did not say whether there was any correspondence between the flow of milk and the amount of water drank. Dairymen should test every cow. He had no doubt that all the profits of many herds came from a few of the herd, the rest reducing instead of increasing the profits. He had found milk testing chemically six per cent. of fat, that would not yield more than two or three per cent. of butter, while milk showing only four per cent. of fat, would churn four and a half per cent. of butter. The water and albuminuous matter made up the excess of weight.

Prof. L. B. Arnold commented upon the fact of milk containing only one-half of one per cent. of minerals, as indicated by Prof. Edwards. Yet the soil has wonderful influence on the quality of the feed it grows, and hence, on the quality and flavor of the milk resulting. But small as the amount of mineral matter is, it is very essential, to make milk a perfect food. It is not a perfect food, however, for any except the young, and for them but for a short period. It is not suited to adults as an exclusive diet, for it does not contain enough of the respiratory or heat-producing elements, while it has an excess of nitrogenous matter not needed for tissue-building, and of minerals not needed for bone-building. This excess soon clogs the system or breaks down the organs exercised in throwing them off as superfluous material. Skim-milk is still worse for elderly people, because deprived of its fats. The butter fats are equaled by no others in aiding digestion. The volatile oils which they contain are very penetrating, and help wonderfully to break up and dissolve the solids—especially the caseous ones. Milking cows in ill-ventilated stables is not only favorable to the introduction of bacteria into the milk, but to the absorption of bad odors. These are introduced, not so much by being absorbed by the milk, as by being breathed by the cows, thus going into general circulation and tainting all their fluids, milk included. Fifteen minutes in the stable, inhaling the odors, are sufficient time in which to impart their smell and flavor to the milk. He had known milk tainted and flavored with onions by the cows feeding in the pasture by the side of an onion patch. In ventilating a stable, it should be so done that the air will come first to the cow's head and pass out at the rear of her, instead of coming in, as is usual, through an open window behind her, carrying along with it the odors of her droppings to be inhaled at every breath.

Prof. I. P. Roberts recommended concrete—one part of Portland cement to two of sand—for the floors of farm buildings. But he would have the cows stand on wood, as more comfortable; and to prevent the planks from rotting, he would imbed them in an inch or two of cheap salt. The floor of the dairy house at Cornell University slopes from all sides to a sewer pipe which receives and runs off all the liquids. Wood cannot be kept clean enough for the floor of a dairy house.

Hon. Willis P. Hazzard recommended dairymen to purchase blooded bulls for use in grading up their herds. In no case should a grade bull be relied on, as he may grade down instead of up. Be sure that the bull is of a good milking family, and has good points.

Prof. G. C. Caldwell discussed the influence of food upon milk, He said, anything held in solution in the blood may be carried into the milk, though it appears probable that milk is the immediate product of the tissues of the milk glands which are broken down and assume a liquid form. The blood, however, may be no more watery, on watery food, than on dry food. But insufficient food thins the blood and also reduces the quality of the milk. Some diseases have a similar effect. In late trials, it was shown that the relative proportions of the fats and albuminoids may be changed by food. By feeding palm-nut oil, there was an increase of the fats, but none of the caseine. The same feed and care do not always produce the same result. It is safe to increase the food as long as there is any corresponding increase in the amount and quality of the milk yielded. Good silage, fed in a proper manner with other food, will not injure the milk. Chemists are experimenting on the effects alkaloids have on milk; and though they have still much to find out, they will always be valuable aids to the dairymen. Aromatic grass might be used to flavor milk, but the result might not always be favorable to them. Sweet clover is not relishable by cows and it affects the milk badly. Grown in mass, cut early and properly cured it is more nutritious, and might have a more favorable effect on the milk product.

B. D. Gilbert said the manufacture of skim cheese had hurt the reputation of our goods, and fine goods are now sought in Canada by foreign buyers. But Canada cheese last season was made too dry, and over-salted. There was an increase in home production during the past season, but retail dealers should be content with smaller profits than they are wont to demand.

Prof. Arnold said the lack of home consumption, was owing to the poor quality of the cheese put upon the retail market. He was in favor of a State appropriation to employ a competent cheese-maker to travel over the State and instruct the cheese-makers, as has been done in Canada and in some of the European countries.

Dairy Commissioner Brown rehearsed the work of his department. The duty has devolved upon him to ascertain just what statutes are in force since the decision of the Supreme Court in the case of Marx *vs.* The People, and how far they have been modified by that decision. He now has over 200 cases on his hands, and new ones are constantly arising. This State has over $200,000,000 invested in dairying, and the annual production is not less than $60,000,000, and he thinks so large an industry is entitled to its share of legislative care. Some might think the appropriation of $50,000 large. So it is; but if it were $120,000 he could do more effective work, and the share of the tax which would be paid by a farmer owning a $5,000 farm would be only 20 cents—the equivalent of a pound of butter, or of two pounds of cheese, or of two 10-cent cigars.

Major Henry E. Alvord protested against our exhaustive system of farming, which gives us a little present gain at the expense of our ability to produce more wealth. He considers stock-raising and dairy farming the best for the farm and the farmer. We should improve our stock as well as our farming. We ought to bequeath to posterity something better than exhausted farms and worn-out tools.

Jessie Owen gets 250 to 278 pounds of butter per year from a cow. He has grade Jerseys. He thinks an acre of corn-stalks worth as much as an acre of hay. He cuts and cures the corn-stalks as soon as the ear is formed. His grass is cut early, and cured as little as possible and have it keep. He gets better results from winter milk than from summer. His stables are kept at 45°. Spring water is given the cows once a day. He raises 10 calves a year from his best cows. They suck only a few times, and then they are fed skim-milk. At the end of a month, he gradually drops off on the milk and feeds hay and ground feed. The calves are seldom troubled with scouring. His cows are fed oats and corn ground together in equal proportion. Of this meal, they are given, mixed with bran, eight quarts a day He sets his milk in a dry cellar the year round. In Winter it is heated to 60° or 65°.

The election of officers resulted in the choice of Hon. Harris Lewis, Frankfort, for President: Maj. Henry E. Alvord, Houghton Farm, first vice-President; and Hon. Josiah Shull, Ilion, Secretary and Treasurer.

The Poultry Yard.

PROFITS DERIVED FROM EARLY CHICKS.

Losses of chicks; necessity of warmth; gain in weight of different breeds; results of an experiment; when to market.

P. H. JACOBS.

THESE depend upon the markets and the locations of the poultry farm. Experiments have shown conclusively that up to the weight of three pounds, the cost of production is five cents per pound. But this may be increased if the chicks are not properly brooded. When a brood of chicks are hatched by a hen, early in the season, she will be successful with them in proportion to the care given her. If allowed to carry her brood wherever she prefers, and a sudden change in the weather occurs, such as cold winds or rain, the chances will be that she may lose some of them; but if she is kept in a dry, warm location, well sheltered, and the chicks are fed regularly, the loss will be small. The same rule applies to raising chicks in brooders. The loss of chicks among those under brooders is apparently greater than with hens; but it is well known that a hen hatching out 10 chicks will be fortunate if she raises eight of them. The same proportion among the brooder chicks allows a loss of 20 out of every 100, which, though seemingly large, is less than the usual loss with hens.

Young chicks grow very rapidly when kept warm, and that is the secret of success—*keep them always warm.* They require feeding very often at first, for the reason that there is a rapid formation of feathers, and consequently the food should be highly nitrogenous (meat, milk and eggs), while the ground grain should contain largely of phosphates (wheat and oats), though corn meal may also be given moderately, as it produces warmth. The practice of feeding chicks on corn meal is well enough in the Spring, when the hen can carry them about, and assist to procure other food for them, but in the brooders a variety must be supplied. Although it may be a repetition, it is safe to claim that the bowel complaints are due to colds contracted through insufficiency of heat in the brooders (from 90 to 100 degrees being required), and as crowding, disease, and debility are caused thereby, too much care in that respect cannot be exercised.

Up to the age of three months, the average gain of each chick per week, in a selected brood for experiment, was four ounces; but they were specially fed in order to attain the greatest possible gain in the shortest time, gaining more, of course, as they advanced in age than during the first week, they weighing two pounds each when nine weeks old, and three-and-one-fourth pounds each when 13 weeks old, no deduction, however, being made for weight at the time they were hatched. While the average farmer may not be equally successful, yet the experiment demonstrates what *can* be done. The average weights are about one-and-a-half pound at eight weeks of age, and two-and-a-quarter pounds when they are three months old.

Contrary to expectation, it was found that chicks from all the breeds made nearly the same ratio of growth up to the age of four weeks. That is, chicks of the Leghorn breed, when weighed in lots of ten, were as heavy as Brahmas of the same age and number, but after they arrived at the age of four weeks, the chicks of the large breeds gradually increased faster. On weighing Brahmas and Leghorns, in lots of ten, when eight weeks old, the Brahmas weighed 17 pounds and the Leghorns 14. Ten Plymouth Rocks, of the same age, weighed 14 pounds, or the same as the Leghorns. All the chicks had been fed alike, being in one brooder. The above applies to pure breeds only. Crosses of the Plymouth Rock and

Brahma have done better, as also crosses of the Houdan and Brahma, they being the chicks that attained two pounds each when nine weeks old. For market purposes the best results are obtained when Plymouth Rock, Wyandotte, or Houdan cocks are mated with large hens of the Asiatic breeds.

The great obstacle to obtaining the highest prices is, that chicks of certain weights must reach the market at a particular period. If too soon, they will sell for but very little, and if too late, the same difficulty occurs. Just what that time may be cannot be stated, as something depends upon the severity of the Winter. For instance, about the first of February, there is a demand for small chicks of less than three-quarters of a pound each. Should they reach the market too soon, they will get there ahead of the demand, and as each succeeding week a heavier chick is preferred, if the three-quarter pound chicks arrive in market when the demand is for those weighing a pound each, the heavier ones may sell for 75 cents each, and the lighter ones at only 25 cents; but should the pound chicks arrive when the demand is for smaller weights, the spectacle will be presented of a half-pound chick selling for double as much as those that are heavier. The greatest demand is usually when asparagus is in the market, but those who make a specialty of raising young chicks should keep themselves well informed regarding not only the prices, but also the weights in demand. Should the chicks be hatched so late as to be behind the size wanted, they cannot recover such disadvantage. Hence the value of incubators, which afford the poultryman opportunities of hatching at any time desired.

Rural Topics.

Experiment Grounds of the Rural New-Yorker.

TO DESTROY THE PEA WEEVIL.

We have been discouraged from trying to raise new varieties of peas by cross-breeding, for the reason that nearly every pea becomes so badly weevil-eaten as to be nearly worthless. Last Summer, we treated all of our peas saved for seed to bisulphide of carbon. A few drops were put upon cotton and the cotton placed in covered tomato cans which contained the seed peas. Up to this time (Jan. 1), after a careful examination we do not find any weevil holes.

A few weeks ago, we received 34 bushels of the Alaska Pea from Cape Vincent, New York. These were measured out into 20,000 envelopes for our seed distribution, and but *one* weevil was seen. Were they treated in the same way, or were they grown in Canada where no weevils are seen? Bisulphide of carbon is not costly, and an ounce bottle, we should think, would suffice for a dozen bushels of peas.

FORSYTHIA OR GOLDEN BELL.

The Golden Bell, considering that it is of comparatively recent introduction, is very well known. This is because it is a beautiful shrub—beautiful in flower, beautiful in foliage and one easily raised from cuttings. It was sent to England from China by Mr. Forsyth in 1845, and a few years later was catalogued by the nurserymen of this country. Its switch-like branches remind one of willow shrubs, and its flowers of the Dog-tooth Violet. It begins to bloom here from the middle to the 21st of April before the leaf-buds unfold, wreathing the stems as if with yellow stars. The flowers last until about the middle of May, when the bright-green, sturdy foliage is fully developed. In late Fall the leaves change to a dark purple, and they do not fall until early Winter. We have referred to it before, but still it may not be generally known that this shrub is well adapted to being confined to a single stem, when, in two or three years, it forms a very pretty little tree, resembling, in general appearance, an oleander. The suckers must, of course, be removed and the branches cut back as needed.

Within a few years another Forsythia has been introduced—Forsythia Fortunei—which by some has been considered the same as the F. viridissima. Last year we compared them carefully, and find that they are really different in many respects. The leaves of Viridissima are more lanceolate. The petals of the flowers of Fortunei are a little longer and a third to almost a half broader, and of a lighter shade of yellow and a trifle thicker. The tube of the flower is also longer, while the calyx is a third longer. The orange stripes in the throat of Viridissima are of a deeper color, and the pistil longer in every flower than the two stamens; while the two stamens in Fortunei are invariably longer than the pistil. The limb of the corolla in Viridissima is obscurely veined, while that of the other is distinctly veined. The main branches of Fortunei do not have so many secondary branches; the flowers are mostly four at each node, two on either side; while in Viridissima there are usually but two at each node. As, however, Viridissima sends out so many secondary branches, the flowers seem to be more in clusters at a little distance. We observed, also that they were more drooping. Much of this

FORSYTHIA FORTUNEI. From Nature. Fig. 12.

may be seen by a comparison of the two cuts, which are drawn from our own specimens (Figs. 12 and 13). Both shrubs are quite hardy here; but how much further north they would prove so we are not prepared to state. Perhaps some of our readers of the Northwest, as also in Canada, will kindly advise us.

It needs only to be added that these Golden Bells are the showiest of all shrubs of the early season in which they bloom, and well merit a place in every garden. They are catalogued by all nurserymen at from 25 to 50 cents each.

BLANCHING CELERY IN THE CELLAR.

We are now (Dec. 23) using celery which has been blanched in a large packing-box in the cellar. A small quantity of soil was first placed in the bottom, and the plants set upright upon this as closely together as they could well be packed. This was done Nov. 25, at which time the celery in the garden had merely been "handled." It is splendidly blanched, and as tender as any celery we have ever eaten. The variety is Carter's Ivory, a half-dwarf kind.

FORSYTHIA VIRIDISSIMA. From Nature. Fig. 13.

Farm Topics.

STORING THIN ICE.

The mildness of the weather during the first of the winter months has doubtless awakened apprehensions of a deficiency of ice next Summer in the minds of many to whom ice has become a farm necessity. Perhaps it may not be known to some that ice four inches thick can be economically stored and kept all Summer. My house, 10x10x10 feet, and almost entirely above ground, has kept ice through the last two Summers, at a cost of $10 each season for filling, not counting the labor of my own team and driver. The ice was four inches thick and was hauled two miles, and the house was filled in a day and a half.

The plan is not original with myself, but common to the farmers of Ocean County, New Jersey, where the mild Winters sometimes fail to make even four inches of ice.

In filling with thin ice, we take it in irregular cakes from the water, as large as may be conveniently handled, and throw it into our wagons. Having spread nearly two feet of sawdust in the bottom of the ice-house, we throw the ice into the house, and break it down as fast as possible by striking with the flat side of an axe all the projecting points of ice, so as to leave no very large cavities, though there are many small ones everywhere. We fill from wall to wall, and in this careless way, disregarding all attempts to place it in layers, we fill as near the rafters as we can put it in. We now leave the doors open for about two weeks for the ice to settle a foot or two; then we apply three feet of sawdust—much more than where it is packed in courses, for as it melts away from the walls we run the sawdust down near the walls, to preserve the ice from wasting. This we do twice a week; if the weather is very mild, for several weeks; and then about once a week during all the Summer we tramp it down around the walls of the house. This method doubtless requires much more ice, but I judge less labor. It is only commended to those who are unable to get thick ice because of the usual mildness of the climate, or the exceptional mildness of a Winter like this.

Farm Economy.

A HANDY CORN-HUSKING BENCH.

To husk corn all day, standing or kneeling, is among the hardest works of the farm, and if one uses a stool to sit upon, or sits on a bundle of corn-stalks, the legs are so much in the way that fast work cannot be done. It takes but little lumber or time to construct a stool like that shown at Fig. 14. It is made by procuring two pieces 1⅛x2½ inches, and nine feet long of any light, strong wood. On the side in the middle of each, fasten a piece of one-inch board eight inches wide and five feet long, across these, four inches from each end, fasten a piece of 1⅛x2½, four feet long, and on these fasten five pieces of light wood ¾ x4 inches wide and five feet long. Across the side-pieces six inches from each end, fasten an inch board eight inches wide and four feet long for a seat. To each side, 10 inches from each end, fasten a piece of tough wood 2½ inches square and 10½ inches long for a leg, halving it on to the side piece and bolting through with a ¼-inch bolt. Crosswise under the side-pieces fasten to the legs a board of strong wood 1x6 inches, which should be notched on the upper edge so as to go snugly between the side-pieces. It will be 10 inches from the seat at each end to the corn platform. To use it, tip it up against the shock, and by taking hold of the band and pulling down, the bench will be tipped up, carrying the shock with it. Two huskers can now take hold of the ends of the side pieces, which should be nicely rounded, and carry the shock where desired. They can then sit down each on a comfortable seat and husk the shock much sooner and easier than they could kneeling on the damp, cold ground. Such a corn rack will pay for itself every week, if not every day.

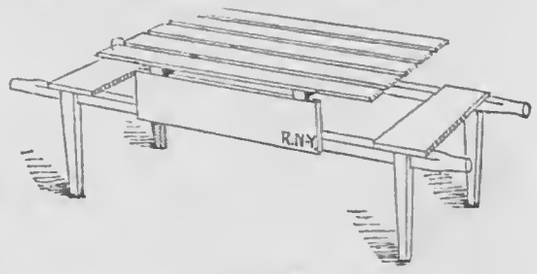

Fig. 14.

A CONVENIENT MANURE SKID.

Here is my plan of loading manure with a hay fork:—A grapling hay fork is fixed to one of the beams in the basement, and the wagon is

food. It is far better to feed a certain quantity to three cows and produce 600 pounds of butter, than to feed the same amount to four cows and only get 500 pounds, as is often done. Keep the young cattle growing without check from the time they are started as calves until they are ready for the shambles or the dairy. To do so is less expensive than if they start again after they have once been stunted. The same rule applies, also, with all young stock.

Use plenty of bedding for all farm stock, saving for this purpose everything that can be obtained. Stock are more comfortable and the manure heap is augmented. If muck can be obtained, compost it with the barnyard manure.

Feed hens well with a variety of mixed feeds and keep them supplied with plenty of material for shells, as powdered clam and oyster shells, burnt bones, etc. Provide also plenty of fresh water daily. If they are kept in confinement, spade or plow up a small portion of the yard every few days, and give them a chance to work in the soil. It is more healthful for them, and they pick up a great many insects, etc. If the fowls are kept confined, throw all weeds pulled from the garden in their yard. It is surprising how much green feed they will eat. Clear the hen-roosts from lice by scorching them with a flame from a cloth saturated with kerosene oil and sprinkled with sulphur.

Give all farm stock shelter from the cold storms of Autumn. Feed milch cows sparingly, and they will yield sparingly.

Remove all unnecessary fences and so gain in area of land cultivated and also in the convenience in working the same.

Provide yourself with some kind of shelter for wood, and keep at all times supplied with sufficient fuel, and thus save fully one-third in quantity of fuel required, besides saving many times that amount in good nature of your wife and family.

Clear up all decaying vegetation, and add to the compost heap and thus turn it to some account, and at the same time prevent one leading cause of malaria.

Concentrate your forces. It is better and at the same time more profitable to grow 150 bushels of ears on one acre of corn than to work over two acres for the same amount, and the same in proportion with other farm crops.

Keep fruit trees properly trimmed from the beginning of their growth, and so secure the desired form, and save cutting large limbs. In manuring the orchard, manuring a small strip just about the body of the tree will not meet the requirements, especially if trees are large. The whole surface should be equally enriched.

If maple sugar is made on the farm, have everything in readiness to begin operations when sugar weather arrives. One day's time lost on every 100 trees is no inconsiderable loss. Keep every thing pertaining to the "sugar camp" scrupulously clean. A small amount of impurities in the sap becomes so concentrated when boiled down to sugar, as seriously to affect both color and quality.

In preparing any kind of farm produce for market, remember it is the first-class article which brings the greatest profit. Better sell one barrel of prime fruit for $3, and keep the half barrel of inferior at home, and use or feed it out, than to pay the cost of sending all to market, receiving only the same amount for the whole.

Keep all your promises, especially if you are a poor man. A poor man cannot afford to have his credit impaired by failure to meet his promises. Finally, follow the advice of the RURAL, and avoid running in debt, and so become successful, prosperous and happy.

Horticultural.

A NOTE FROM PETER HENDERSON.

I THINK you are all wrong about the flavor of the White Plume Celery. I'll engage to let you taste six different kinds, including White Plume, and if you will, thrice in succession, be able to tell "which is which," I'll agree to make a present of a five years' subscription to the RURAL to any friend you may designate; for the fact is, with the exception of the Red and the Sandringham, there is no perceptible difference in the flavor of any celery; it is its condition that affects the flavor, not the variety.

THE LINCOLN BLACKBERRY.

IN the RURAL of Dec. 19th it is said that the above blackberry originated on the grounds of President Lincoln. This is an error for it originated on my fruit farm two miles northwest of Springfield, Ill.: 11 years ago it fruited for the first time. I have fruited it for 11 years without a failure. The very hard Winter of '83—'84 killed all blackberries in this part of the State, except Lincoln and Snyder. The former came through and bore a full crop of fine fruit, while Snyder only bore a partial crop. W. H. LIGHTFOOT.

A COLLEGE EDUCATION.—A young man, 18 years old, earning $6 a week, with poor parents, writes to the N. Y. Sun for advice. He has worked ever since he was 14 years old, sees small chance of getting a better place, and thinks if he could get a good education at some college, he might do better. The Sun wisely states that the college means an entire change of life in every way. Instead of earning money, the boy must become a charge on his parents for the next six or eight years. Even at his present salary he would earn during that time over $1,800. He must give that up and run in debt for the cost of his education. It would take him two years to prepare himself for entering college. If he graduated at 24 years, he would have hard work to earn $300 the first year after graduating. The ordinary college education fits no one for special employment. It is simply a foundation. Long years of special study are required, to build upon it. Even after the profession has been gained, there are long years of struggle with poverty. The Sun doubtless had in mind a city boy. These statements may rub the vanity of the average boy, but they are absolutely true. In these days of "influence" and "name" the poor college graduate, with no weapon but his education, is like a man fighting against an army with a lump of iron. He must forge, sharpen and polish his weapon alone. There is no harder work in the world, but there is none which, if faithfully endured, brings out a truer manhood. It is easier for the country boy to obtain an education. The agricultural colleges of the West are filled, for the most part, with boys who pay a large proportion of their own expenses. By teaching during the long winter vacations, by working on the college farms, and doing other work that may be presented, a boy can work his way through college. The majority of boys do not have the heart to work through. Not over 25 per cent. of the boys who enter the freshman class with no resources beyond their own labor, ever graduate. They become discouraged, or else discover that the "education" involves too much work, too much responsibility and too much privation. The boy that starts in with the idea that the moment he obtains his degree, the world will open its doors to him, will be sadly disappointed. The world always looks with a little distrust upon the "fresh" college graduate. It is only after a year or so of hard rubbing against the world that he can "pass." The successful agricultural colleges of the West offer by far the best chance for the poor boy. He can find plenty of time for study, and the hours, which at literary colleges are devoted to exercise in games or walking, he can make profitable on the farm. At the end of his college course he can easily make $300 and his board per year, and gradually work his way up into a sure and profitable business.

SHORT AND FRESH.

ROBERT DOUGLAS believes the White Pine to be the most valuable timber tree for Iowa, Minnesota, Dakota, Wisconsin, Canada, and the New England States. The Scotch Pine is one of the most rapid growers of all hardy evergreens while young. It makes a fine windbreak for orchards and buildings.....

MR. DOUGLAS says that the American White Spruce is far preferable to the Norway for the West, as it endures the hot, dry winds in Summer, and never browns in Winter. As an ornamental tree for the East, we much prefer the White to the Norway Spruce . . ..

MR. DOUGLAS characterizes (no doubt justly) the Wild Black Cherry as one of the most rapid growers of all our valuable Northern hard-wood forest trees, making lumber almost equal in value to the Black Walnut. It grows freely on any dry land, even if too poor for agricultural purposes. It is of upright growth, and very easily transplanted .....

PETER HENDERSON mentions, in the Garden, that, during his recent visit to England, nothing surprised him so much as the growing of tomatoes. In one establishment, there were in running feet, two-and-a-half miles of greenhouses all filled with tomatoes; These must have cost not less than $100,000. The tomatoes were then selling at six pence sterling per pound, or about $6 per bushel. Here is a chance for our growers to send tomatoes to England in cold storage. But we want better-keeping tomatoes ....

O. S. BLISS expresses the opinion in the N. Y. Tribune, that if the public knew enough to select the best poultry and keep them, the occupation of some folks would be soon gone: 99 per cent. of the people who buy fowls and eggs at fancy prices are disappointed .....

IT may be well for our new readers to bear in mind that the Potato Special of the R. N.-Y. will be dated the 16th instant. Everybody who lives in the country ought to raise potatoes—therefore everybody ought to read the Potato Special ....

ONE of the delights of country life in the Winter, is derived from having plenty of evergreen trees about the country home.... .....

MR. STEWART says that lambs will make twice the growth in Winter they would otherwise do, if they are given a very little ground feed, or a small quantity of rye or oats, once a day. Good clover hay is the best staple food for them. A few chopped turnips or beets or a chopped cabbage will be very grateful and useful to them..... ....

DR. HOSKINS says that a man's farm is a volume, every acre of which is a page bearing the marks of his character, indicating the degree of mental and moral culture to which he has attained .....

THOSE interested in poultry should read the R. N.-Y. during this year .....

A WRITER in the American Florist thinks that the Bride is destined to become the most popular white rose ever known .....

THE New York Experiment Station has succeeded in raising cabbages from leaf cuttings, the same as begonias and a few others may be propagated ....

ANOTHER interesting experiment made was that of growing cabbages from green (unripe) seed. The seed sprouted before ripe seed, and the heads were earlier and larger. .....

THE New York Experiment Station finds Buhach (Pyrethrum) powder, applied through bellows almost "instantaneons" death to the cabbage worm. The RURAL was the first journal to use Buhach in this way. But we have never known it to kill them immediately. From four to ten hours are required. Our later subscribers may be interested to know that we ascertained last year that this insecticide will kill rose bugs.. .....

SEVERAL of our agents while visiting New York have at our suggestion examined the RURAL'S Avery Sewing-Machine. They all report that it is by far the simplest, lightest-running, nearest to noiseless, and, altogether, the best machine they have ever seen. It is constructed upon an entirely new principle and must not be confounded with the *old* machines offered by other journals. The retail price is $60. We give it for 40 subscribers, pay the freight, and guarantee it to please....

A WRITER in the Maine Farmer says that a blush of shame yet burns on his brow as he thinks how many more comforts he could have provided for his dear lost ones had he done without tobacco; how many hours of needless labor he could have saved his gentle wife if he had not cared so much for tobacco. It is the same with many of us to-day. .....

MR. HIRAM SMITH, of Sheboygan Falls, Wis., on a farm of 200 acres, feeds 65 cows, six horses and 36 head of calves and yearlings. Every ounce of feed that is bought is paid for in money that comes from pork made from skimmed milk. Every one of the cows earns $75 per annum. The U. S. Dairyman in noting these facts, says that the man who keeps cows cantering over about five acres or more of land to get a skimped livelihood may wonder how it is done; but it is easy enough, if one knows how, and there is no necromancy about it, either. The vital items are, the half-soiling process; some grain food, fed in a warm barn every day; eleven months' milking of each cow in the year; a utilization of all the manure; the raising of half an acre of corn to each cow; and a command of the best market that a steady production of a good article of butter, every day in the year, gives one who can meet the wants of steady customers. . ..

THE English sparrow surely seems to be doomed. The Farm and Home contains an article showing how to cook the little wretch so that it will be quite palatable. The birds are stewed, roasted or jugged. In the latter process, they are boiled and then placed in a sort of pickle. They are said to be really excellent. They ought to be, for they live on the "fat of the land." ....

THE U. S. Dairyman thinks that a man will not develop himself into much of a dairyman so long as he milks his cows in a yard, feeds them little or no grain, and lets half of the value of the manure be washed into the creek, instead of being saved and carted to where it would do the most good ... .

AT the recent Illinois Horticultural Meeting, the drift of opinion was that the farmer's garden, planted in rows clear across the patch, cultivated so far as possible by horse-power, and given as good cultivation as the best farmers give their corn fields—a half acre in vegetables would supply half the living of the average family, and add largely to the health of the members .....

EXPERIENCE has taught most English farmers to keep the silage out of the stables where the cows are kept, and to require men who handle the product to wash their hands before milking. Most of the tainted milk seems to be spoiled by direct contact with the silage...

COMMISSIONER COLMAN wants an appropriation for the purpose of developing the agricultural capabilities of Alaska, and to determine what breeds of cattle, etc. will do well there. Mrs. Wager-Fisher's letters published in the RURAL show the utter impossibility of stock-raising in Alaska. Better apply the work and money nearer home. Oleomargarine is on top yet .....

Everywhere.

TRANSCONTINENTAL LETTERS.

XLVIII.

MARY WAGER-FISHER.

Weather and fruits in Western Washington Ter.; the White River Valley; good farm houses and farming; a well ordered boat.

A FEW days after our return to Seattle (Washington T'y.), there was a fall of rain accompanied by thunder and lightning equal to an ordinary Eastern thunder storm. I mention this, as I think I have at some time stated that thunder and lightning are almost unknown on this coast. They are rare, it is true; but they do occur. Old residents said that the duration of warm weather this season was longer than ever before experienced, and for several weeks there was quite a display of summer clothing. Certain fruits were in great abundance, particularly plums and blackberries. I measured some plums, an amber-colored variety; one was eight inches in circumference one way, and 7½ the other—delicious as large. Very fine peaches are raised on the shores of Lake Washington, just back of the town, and also in other localities; but while the trees bear profusely, there is some difficulty in raising this fruit, as the trees are very short-lived. Strawberries and blackberries often bear a second crop in October.

I wish to correct a statement, or opinion, rather, of the RURAL, as expressed in the issue of July 18, page 484, concerning the "Evergreen Blackberry." My attention was first attracted to this blackberry a year ago, as I saw it growing over a trellis. I thought it extremely ornamental, and it was still in fruit, the month being October, and its yield, I was afterward told, was 100 quarts in one season. Not far from the first of October of the present year I saw another "Evergreen Blackberry" vine which was equally a marvel. The one vine of three or four years' growth had yielded during the present season 120 quarts of berries. As the plant had grown, a part of the branches had been trained along the side of the dwelling-house and up on the roof, while the other part had turned off in an opposite direction on a trellis and up in trees. From end to end it measured, probably, 40 feet. Its habit is very like that of the most robust climbing roses, and it is altogether unlike any variety of blackberry that I have seen growing in the East. The fruit is good, similar to the Lawton in flavor, and it fruits at a season when other berries are out of market. Its botanical name, as I have heard it given here, is Rubus fruticosus. The leaves are very pretty, and the white petals of the flower are three-fingered, or trifid at the end. None of the canes that I saw were as "large as a man's arm," but some of them were probably an inch or more in diameter, and the plant had received no special cultivation. I have been unable to learn anything definite as to its origin, although various stories are told as to its antecedents. That it is generally hardy, is claimed for it; but it is quite likely that it attains to more remarkable proportions in the rich, new soil of Puget Sound than it would in many other regions. The vine which I saw and which yielded 120 quarts, is on a farm about three miles north of Seattle, and the owner of it, so far as I know, has no interest in it beyond finding a market for the berries.

The smoke which obscured not only the Puget Sound region but all this northwest coast excepting Alaska, where the forests are too damp to burn, lasted for six weeks or more, and the clearers of land called it a good "burn." These fires will probably continue for a similar period for a quarter of a century to come, or until the forests have been sufficiently cleared for agricultural purposes. The smoke is unpleasant to many persons—I was not annoyed by it. When united with fog, it is a regular London atmosphere; but when the rain came and cleared the air, it was like waking up in a new world. So it came about that, instead of leaving the Territory for Oregon and California the 1st of September, we were detained

driven directly under it. At one side of the wagon is placed a shield or apron, up which the manure slides. Mine is made of 2x4 stuff and two-inch plank bolted together. A front view is given at Fig. 15, and a side view at Fig. 16. Three like Fig. 16 are made the hight of the

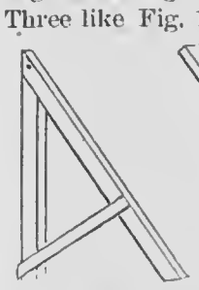

Fig. 15.

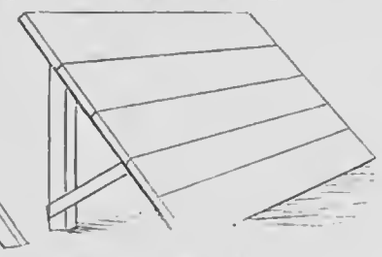

Fig. 16.

wagon and the planks are as long as the wagon. The ground pulley is then attached and the horses hitched to the rope. Two small forkfuls generally fill the wagon with straw manure. R. E. D.

Catherine, N. Y.

WAGON BOX SEAT ELEVATORS.

THE wagon-box seat elevators shown at Fig. 17, are so made that they can be taken off in

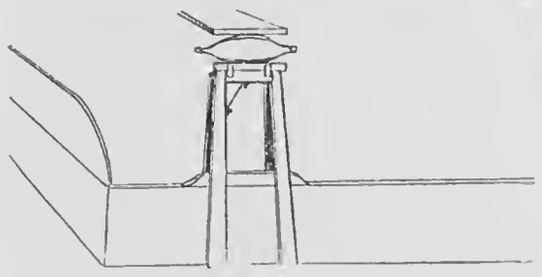

Fig. 17.

an instant and clapped on to a sleigh-box. I find the device just the thing when drawing apple barrels, bags of grain, corn, wood. The seat is up out of the way, and I seldom have to move it to load or unload. A person can make them in three or four hours. Eight strips of ash from two to three feet long, one-and-one-half inch wide at the top and two inches at the bottom, half an inch thick, one piece two feet or so long, and as thick as the wagon-box and another of the same length two inches wide and a little thicker than the wagon-box, so as to make the cleats clamp tightly on the box. Eight 2½x⅝ inch bolts; one brace.

F. D. R.

PRESERVING SHINGLES.

THE RURAL inquires "what is the best way to preserve shingles?" I think an application of crude petroleum or W. Va. lubricating oil is as good as any, and is inexpensive. Seven years ago I coated one shingle roof and the weather boarding of nearly all my out-buildings with these oils. I like the W. Va. oil the best, as it has more body than the petroleum and stays nearer the surface. It is easily applied with a large paint brush in warm weather; in cold weather it will have to be warmed. The objection to oiling is the dark color, especially on the parts not much exposed to the sun. It is also apt to loosen the nails in buildings that are not firm in the frame-work.

Rockland Farm, Md. A. L. C.

The Apiarian.

SIXTEENTH SESSION, NORTH AMERICAN BEE-KEEPERS' ASSOCIATION.

A fine attendance; importance of bee-keeping; bees and fruits; the Bee-keepers' Union; widening the honey markets; comb honey; foundations.

(RURAL SPECIAL REPORT.)

THE attendance at the Detroit meeting of this society was unprecedentedly large. Among those in attendance were the most successful and distinguished bee-keepers of the United States and Canada. The venerable L. L. Langstroth, the father of American apiculture, who honored the meeting with his presence, remarked that this was the greatest assembly of the kind ever held on this continent. Such apiarists as L. C. Root, President of the society, G. M. Doolittle, W. E. Clark and Mr. Barber, of New York; D. A. Jones, and Messrs. Hall, Emigh and Pettet, of Canada; Newman and Dadant of Illinois; Muth, A. J. Root, Dr. Mason, Newman and Boardman, of Ohio; Heddon, Hutchinson and Cook, of Michigan, were present to consider the many important questions vital to apiculture. The "blizzard" had the effect of keeping most of the apiarists of the South at home, which was greatly regretted. The annual meeting for 1886, upon request of the State Association of Indiana, will be held earlier, some time next Autumn, at Indianapolis. H. D. Cutting, of Clinton, Mich., was elected President for 1886; Frank E. Dougherty, of Indianapolis, Secretary; Mrs. Robins, of Indiana, Corresponding Secretary, and Chas. F. Muth, of Cincinnati, Treasurer.

Owing to the great loss of bees last Winter, the reports of honey the past season showed a small product. The year has been generally favorable, though in some States, as California, which last year gave an enormous crop, the product for the present year was very light. Considerable uneasiness was shown as to prices. Though the crop is so small, yet the prices are unprecedentedly low. The opinion seemed to be that the general depression in business was the principal cause. Large dealers who were present thought the tendency of the market was upward. The Venerable L. L. Langstroth gave an interesting account of the invention of the movable comb hive which has revolutionized bee culture

Pres. Willetts, of the State Agricultural College, welcomed the society to Michigan. He showed the importance of the bee-keeping industry, which produced millions of wealth each year, which, without bees and bee-keepers, would be lost. He commented upon the excellence of honey and the fact that it could not be produced except by the bee. He showed that Michigan, in apiculture and its fruits, ranked among the first States. In commenting upon the recent suits at law between fruit growers and bee-keepers, he spoke both as a lawyer and law-maker. He said the courts looked kindly upon this pursuit, because of its usefulness and age. Bees existed before courts or statutes. They have the strong right of prior possession. Science showed that bees did not attack sound fruit, and he added that between honey and wine he felt no hesitation in pronouncing in favor of honey. Pres. Root, of New York, in responding, said that no State stood higher than Michigan as a producer of honey, and that no State, perhaps, ranked so high in the influence exerted to extend practical and scientific apiculture.

Mr. Newman said the Bee-keepers' Union is an organization acting under a constitution, which has for its object the defence of bee keepers in suits of law, where, upon thorough investigation, the complaint is unjust. In the sheep and bee suit in Wisconsin we have gained a signal victory. We are prepared to carry the case decided against the bees in California to the higher courts. Here the fruit growers are acting against their own interests in trying to drive away the bees and apiarists. Prof. Cook stated that it was not bees *versus* fruits, it was bees and fruits *versus* ignorance. A committee of five was appointed, who reported in favor of a union of the Bee-keepers' Union and the North American Association. Owing to some opposition the whole matter was laid on the table.

Mr. L. C. Root, in his annual address as President, referred to the importance of our industry. In the economy of Nature, bees are a necessity. Bees effect full fertilization of flowers, hence seed time and harvest depend upon them. They also give wealth to the nation—create it. Low prices are the result of hard times. We can aid by working to increase the demand for honey. No one should ship honey to the large markets till the maximum consumption had been secured at or near home. This would keep the supply below the demand in our great marts, which really fix prices for the whole country. Mr. Muth said the uses of honey were constantly increasing and there was no real cause for discouragement. All kinds of business were now depressed. Mr. Jones said we were now far better off than the farmers. Our capital was far less, our proceeds greater. Mr. Pettet said we are stimulating too many to go into the business. There is too great a tendency to paint our industry in too glowing colors.

G. M. Doolittle, in a paper on comb honey, said there were four requisites to success. 1. We must have good queens. These cost something, but are worth the cost. 2. We must have full colonies at the time of harvest. A few strong colonies are far better than many weak ones. 3. The apiarist must be skillful. Any bee-keeper can raise extracted honey but wisdom and experience are absolutely necessary to secure large returns of comb honey. Lastly, a good hive is indispensable to the best results.

Mr. Hutchinson said he succeeded best when he used full sheets of foundation—not mere starters—in the sections. Mr. Boardman hives new colonies on starters, and as they make comb, he cuts it out and fills sections with it. If the combs were laid on grass 48 hours, the sun would kill eggs and whiten the combs.

Mr. Hall thought Mr. Boardman's plan awkward. Full sheets of foundation were by far the best. He preferred thick foundation so that bees would have enough wax to complete combs. Said the fish bone was no trouble to consumers, only to the bee keepers. Hutchinson used only five frames at dawn of honey harvest, then he got more comb honey. Hall preferred large hives so as to have plenty of good honey for winter food for the bees. Emigh, a very successful bee-keeper of Ontario, said we must have full sheets of foundation. We get far nicer honey. Doolittle thinks that foundation does not pay in his locality. Taylor, Michigan, said that the foundation causes sections to be better filled and more securely fastened, and so the combs are stronger, but not because it is thicker or less delicate. For shipping alone he should use full sheets, if for nothing else. Mr. Muth said that foundation gives strength, but it is better to use thin foundation, not thicker than eleven feet to the pound. Mr. Walker uses full sheets when honey comes slow, and always in outside sections. This secured more speedy capping. He also found it a great advantage to invert all the sections. We should always be ready to put sections on the hive in time; delay often causes loss.

A. J. C.

(To be continued.)

Entomological.

THE ARSENITES.

PROF. A. J. COOK.

THE surprise expressed by Prof. Budd, in a late RURAL, that I did not recommend the use of common white arsenic, arsenious acid, as an insecticide, at the late meeting of the North American Pomological Society, is a worthy text for a brief article on the subject.

Years ago, when the arsenites were first used to fight insects, we tried here at the College all the arsenites now used, including white arsenic, and found them all efficient in the destruction of all our vegetable-eating insect pests; but after much earnest, thoughtful consideration it was deemed unwise and unsafe to recommend white arsenic for common use as a specific against our noxious insects. A very little investigation will show that nearly, if not quite, all actual cases of poisoning by use of the arsenites have come through want of caution—usually reasonable caution. The only case which has come under my personal observation was when a barrel or tub of flour and Paris-green was left in a pasture field adjoining a field of potatoes. The careless farmer, as he came in the morning to apply the balance of the poison, found he had lost not only his poison, but some of his best cattle. He has since been richer in experience if not in Paris-green and cattle. Now, had these cattle been people, the green color would have saved them. The same would be true in case of London-purple. In all our advice and recommendations for the public, we must consider the peculiarities of people, and must not act as if all persons were cautious. We must also remember how terribly poisonous these arsenites are, and how awfully and irretrievably sad it is for a person to become the victim of their improper use, even though carelessness was at the root of the disaster.

In nearly every case where people have died from arsenical poisons, it has been through mistaking them for something else. How easy such mistakes with arsenic! Like soda, flour, etc., it is a white powder, and in case careless hands have left it in the pantry, what is to prevent a fatal mistake? Not so with London-purple or Paris-green; their peculiar color, especially that of the latter, would prove the very best skull and cross-bones, as it could never be omitted. In cases where accidents are so terrible, no pains should be spared to prevent even exceptional risks. Thus it is that I have always refused to recommend common arsenic, and always protested against recommending it. I agree with Prof. Budd, that the danger of killing stock by their feeding on herbage under fruit trees treated with the arsenites, is slight indeed, if the poison is rightly attenuated; but the greater danger, as referred to above, resulting from carelessness, makes it, I think, unwise and improper either to use or recommend arsenic as an insecticide.

Again, I fear the Editor's report of what I had said may mislead, although I am sure he did not mean it should. While I said the danger of stock eating grass under trees which had been sprayed with arsenites, immediately after the spraying, was not as great as many supposed, I urged most vehemently against such cropping of the grass by stock till after a heavy rain. I showed how little of the arsenite was put on to an entire tree—no more than an even teaspoonful—and how but a very small fraction of that fell to the ground, and that after careful investigation, even with a microscope, I could find so little poison on the grass that I fed such grass to my horse. Yet I said such might not always be the case. Carelessness might put more on the tree; accident might cause more to fall to the ground; and as the article is so deadly poisonous, and the result in case of poisoning so serious, no one should ever permit cattle or other stock to feed on the grass in an orchard for several days after the poison was applied. And I wish to emphasize the caution.

Ag'l. Coll., Lansing, Mich.

Floricultural.

SOLANUM CILIATUM.

[Mr. Parnell generously contributes a considerable quantity of the seeds of this plant to our Free Seed Distribution.—EDS.]

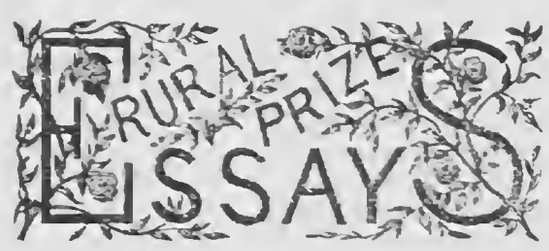
I CONSIDER this to be the most handsome and attractive of the solanums, and it is very valuable for decorative purposes during the Winter in the window garden, greenhouse, or any situation where an average temperature of 55 degrees is maintained, and it also forms a very pretty plant in the mixed flower border during the summer months. It may be described as being a tender perennial of spreading habit, growing from 12 to 18 inches in hight, the stems and foliage being well covered with numerous straight, very sharp prickles. In shape the leaves are oblong and irregularly lobed and of a bright green color. The flowers are small and not at all showy, and are succeeded by the fruit which at first is of a greenish color, marked with dark green lines. As it ripens, it gradually becomes scarlet, and in this condition remains on the plant for 15 months. The fruit or berries are about an inch and a half in diameter, globular in shape, and when fully ripe of a bright scarlet red color, and in this condition very attractive.

It is a plant easily grown. The seed should be sown as early in the season as possible, and as soon as the young plants are strong enough to be handled, they should be transferred into three-inch pots, and when these are well filled with roots, the plants should be shifted into four-inch pots, and just before they are plunged outside (which should be done about the end of May), they should be transferred into six-inch pots. The pots should be plunged in a sunny situation, and during the Summer they should be turned occasionally to prevent the plants from rooting outside. Water should be thoroughly and freely given, and on the approach of cold weather, the plants should be taken up and brought inside.

As soon as the weather becomes settled, these young plants can be planted out in a deep, well enriched border, and grown carefully during the summer months, and taken up carefully and potted early in September. This is the best plan for the experienced plant cultivator; but amateurs had better adopt the former method. In potting, be sure to give good drainage, and use a compost composed of two-thirds of well rotted sods and one-third of well decayed manure.

Occasionally outside the plant is attacked by the potato flea in such numbers as to severely injure its foliage. As a preventive, dust it occasionally with insect powder, soot, or tobacco dust, and as it shows a tendency to grow rather straggling, it should be supported by a neat stake, to which the young shoots should be tied from time to time, as circumstances may require. CHAS. E. PARNELL.

Dec. 21st.



SHORT PITHY PARAGRAPHS.

E. J. BROWNELL.

KEEP ahead of your work during the whole season. Work is so much more pleasant in this way than to have it dragging two or three weeks behind. In order to accomplish this, make plans in advance for the season's work, and, so far as possible, work according to these plans. Then, during leisure time in Winter see that all farm and garden tools are ready for use when the busy season arrives. Keep all farm tools and implements under shelter when not in actual use. So far as possible keep all noxious weeds from ripening seed. Remember that one hour's work in garden or field when weeds first start, is worth one-half day's work later.

If possible, have the kitchen garden so arranged as to use horse culture in both fruit and vegetables, and thus save largely in time or labor. Pack garden vegetables, such as beets, carrots, turnips, etc., in boxes or barrels of sand in the cellar for winter use and so preserve them as fresh as when taken from the ground. Also put in a few parsnips in this way to use during the Winter.

Evergreen boughs make a good mulch for the strawberry bed, and are free from foul weeds.

Economize in feeding stock by utilizing everything grown upon the farm or garden that is suitable for food, but remember that it is not economy to see how much stock can actually be kept alive on a given amount of

until the middle of October, as I wished to visit the White River Valley in clear weather, and go up the river by boat, as from the deck of the steamer one can see the whole valley spread out on either side. This river takes its rise in the Cascade Mountains, in the neighborhood of Mount Rainier, and the water, when low, receives a whitish tint from running over chalk hills.. It is a very sinuous stream and navigable for about 45 miles. The lower part of the river still bears its Indian name, Duwamish, and empties into the beautiful bay upon which Seattle is built, at a short distance from the city. When I went up the river on the first of October, the water was so low that we steamed along at a snail's pace, running on sand-bars and stopping at intervals to pull out snags or to mend the boat's broken rudder. However, the weather was fine and the scenery charming, the soft, varying foliage of the river and valley—alder, maple and cottonwood—being in striking contrast to the stiff stateliness of the fir and cedar on the bluffs of the Sound. The banks of the river were heavily fringed with willow, swamp dog-wood, bearing numbers of white berries (Cornus Californica), wild roses loaded with scarlet seed pods, and nodding stalks of snowdrop, which the natives called "hardhack."

I was impressed anew with the great beauty of the cottonwood, and I am not sure but that it is the most beautiful forest tree in the United States. The leaves of the vine maple (Acer circinatum) were scarlet—a red of a peculiar and striking brilliancy, and much of the foliage of the great maples (Acer macrophyllum) was turning yellow. This maple, in habit resembles the oak in the distance, grows sometimes to a diameter of four to five feet, and a hundred feet high, while the leaves are from ten to twelve inches across. This valley increases in width as we ascend the river and is very level, the width varying from a quarter of a mile to three or four miles, and forms undoubtedly the finest farming land in the Puget Sound Basin. The captain of the steamer told me that above the head of navigation the up-land is excellent, particularly for sheep pasturage, and that the trail to Mount Rainier up the White River is the best route for tourists. He had camped at the foot of the mountain, been on its glaciers and regarded it as the most delightful camping ground he knew of—bears, mountain goats, deer and other wild game abundant. The captain's wife was on board—she said she often went on the river trip for a rest, as they lived on a range up the river. She had in her arms her thirteenth child—all 13 alive and well, and she still a young woman. She said that at one time half a dozen of them were sick with diphtheria and at another time as many were in bed with measles. She seemed as fond of number 13 as if it were her first-born, and she knitted stockings for her youngsters while she sung the baby to sleep with Methodist hymns. The captain was the mildest commander of a boat I ever met.

The navigation was exceedingly perplexing, but there was no display of profanity or impatience. Orders to the men were given without repetition and in a quiet tone. When a meal was ready, the boat was tied up and all hands ate. The boat was tied up at night as well, so that we were nearly 30 hours reaching the head of navigation. The railroad that connects Seattle and Tacoma follows this river in a general way. The first settlers in this valley went up the river in canoes. There is a good wagon road on each side of the stream leading to the Sound, which is a delightful drive. It is a great hop-growing region and we met many canoes full of Indians and their camping outfits leaving the scene of their hop picking—the season being over, although some fields were unpicked, the low price of hops not justifying the expense of harvesting the entire crop. The hop houses with conical roofs and tall chimneys gave a peculiar architectural effect to the valley, while the farm houses and the farming were decidedly the best and the best kept I have seen on this coast north of California.

RURAL SPECIAL REPORTS.

Arkansas.

BEEBE, White Co.—There is no better country for stock raising than this; Winter mild, supply of good running water bountiful, and grasses nutritious. Yearling calves command from three to four dollars per head. These are usually bought up in the mountainous districts where such a thing as raising stock for the market is unknown. Another industry which would bring large returns to the owner, is the sheep industry. There is no healthier place for sheep, especially among the foot-hills of the Boston Mountains. No feeding is required during the Winter, and sheep get very fat during the Summer feeding on Japan Clover, which thrives here well. Our markets for wool, mutton, and beef cattle are as good as can be found in the Union. Our staple productions are cotton, corn, wheat, oats, rye, barley, vegetables and all the different kinds of fruits. Strawberry culture is an important industry in our section, and many are engaged in it. An acre often yields $300 net returns. Under the Local Option Act of some eight years ago, our people have routed out every saloon in this county. G. W. W.

Canada.

DARTMOUTH, Nova Scotia.—Nearly all the Rural Corn came up and grew well, but it was almost too late for the climate. Although we had the finest and warmest Summer for years, only two or three ears ripened. Of the Stratagem Peas, 20 came up out of 50 seeds planted, and several of them failed during Summer; none were very vigorous. I have saved all that were good. Prince of Wales, about the same report as Stratagem. A larger portion of them came up, but more failed to grow, and both peas and pods were smaller. Johnson Grass failed to come up. Of Flageolet Beans I harvested about three pints; increase, 40-fold; quality good, not extra. I had a very fine lot of tomato plants and fruit from a sowing of about a quarter of seeds sent, and owing to the fine Summer, nearly all of them ripened. King Humbert was in great variety of form and size. From the Garden Treasures packet we had a large variety of flowers. H. E.

Connecticut.

LONG HILL, Fairfield Co., Dec. 21.—The Rural Corn did not ripen—season too short. Stratagem Pea, finest I ever saw, very large, prolific, and of excellent quality. Could not say as much for the Prince of Wales Pea. Johnson Grass was a failure. Tomatoes not as good as Acmes. Flageolet Beans great yield, early and of good quality, but rather small. The Garden Treasures were just splendid. Last season was a poor one with us on account of having no rain in June. G. M. B.

Dakota.

ABERDEEN, Brown Co., Dec. 20.—The Rural Blush Potatoes are the finest we have seen. They are now selling at 40 to 50 cents a bushel. Wheat yielded from 15 to 25 bushels per acre. Price from 63 up to 74 cents. Oat yield from 35 bushels upward. Barley from 25 to 40 bushels. Flax from 7 to 15 bushels; price from 81 to 95 cents. Farm hands, $1.50 to $2.00.

E. A.

DE VOE, Faulk Co., Dec. 16.—The climate here is much more favorable for health than that of Illinois, for we have no malaria and a physician would go hungry if he depended on his patients' fees for his bread and butter. We have now been here 13 months and we have seen no worse storm than we had seen many times in Illinois. Last May and June we had three hail-storms that destroyed our garden and we had some glass broken once, but we seemed to be on the outer side of the storms, for only a few miles from us a great deal of damage was done to the grain crops. As we have no wind-break yet, we feel the full force of the wind when it blows, and it seems sometimes as though it would take our house. I think when our little trees grow we shall see a great difference in the force of the wind. In coldest weather the thermometer goes down to 40 degrees below zero. It is so very still here that it does not seem as cold as it did in Illinois when it was only 15 degrees below. We had very poor success with all the RURAL seed as well as with those we brought with us, on account of insects, frosts in May and June, and then early in September every green thing was scorched so badly by frost that our sorghum, corn, buckwheat, melons, squashes and tomatoes were all killed. I think plants dwarf here very much, for my pinks and pansies did not grow nearly as tall as in Illinois. The White Elephant and Blush Potatoes did well and we esteem them very highly. We have but little rain here in the Summer, at least so people told us when we came here; but last Summer it rained more or less up to September 10, and, since then we have had no rain to delay work, neither do we get snow enough to give us good sleighing MRS. J. T.

Florida.

MANATEE, Manatee Co.—No one should come to Florida with a view to tropical fruit culture. There are great risks and uncertainties attending such an enterprise. During a residence of 20 years in the southern portion of the State, though not in the extreme south, I have learned that owing to the occasional severity of the Winters, it is folly to undertake the cultivation of the lemon, lime, guava, pineapple, banana, cocoanut, mango, Alligator Pear, or any other tropical fruits, and even the orange, though more hardy, is frequently badly injured by heavy frosts as far south as the 27th parallel. The lands of the State have been gobbled up by a horde of hungry speculators, who have no use for them except as a winter resort, and who do not hesitate by every manner of misrepresentation to delude settlers. I am a Northern man and all my interests are here and I want to see the State settled up with good people; but knowing as I do from observation and experience the risks attending fruit culture, and reading the assurance that "vegetation is unhurt by cold," that "ice is never seen," and everything is green and flourishing the year round, and the tendency of such reports to mislead parties into making ruinous investments and great sacrifices, I have determined to say this much towards an exposure of Florida land frauds.

J. F. B.

Idaho.

HORSE-SHOE BEND, Boise Co., Dec. 21.—The 50 different crosses of the best kinds of corn were planted as soon as the ground was warm; a soil rich, sandy loam. The corn was truly a crossed lot:—from one to six ears to a stalk; stalks from six to 13 feet high. The short stalks matured their ears; the tall ones did not. I selected the earliest short-stalk corn for seed. Carter's Stratagem Pea is not early, but it is the most prolific I have ever grown. One pea yielded 76 pods, with three to eight peas in a pod. Saved all the seed. Sorghum halapense did not head out. For a dry climate, it will prove good. Our dry season lasted 101 days, and in all that time there was not rain enough to lay the dust. The Sorghum halapense lived and grew all Summer without artificial watering. The chickens got at it a few times, which prevented its heading. I shall try it another year. The Bicolor Tomato bears and grows well, and is desirable in every way. The King Humbert Tomato is a good bearer, intermediate in size, pear-shaped, not very good for eating, but excellent for preserving. The Prince of Wales Pea did not do as well as the Stratagem. The pods remained green much longer than other peas. The new variety of the Green Flageolet Bean is a persistent bearer and a great feeder. The season has been a poor one for beans. The Flageolet passed through better than many others. We did not succeed well with the Garden Treasures. I'm sure we did not treat them with proper care. The Thousand-fold Rye yielded well. It is better than any rye I am acquainted with. The Diehl-Mediterranean Wheat attracted much attention. The stools are strong and capable of carrying a good weight in a strong wind without falling. I believe it will be the coming wheat for our locality. I planted all the new seed; it is looking well. A. L. R.

Michigan.

COURTLAND, Kent Co., Dec. 24.—From the packets of Diehl-Mediterranean Wheat I had 13 pounds of very nice grain, very large kernels, very large heads. I think it will be an excellent kind. Of the Thousand-fold Rye, too, I had 30 pounds. It was very large and white—the best I have ever seen. I have sown both wheat and rye again. The 50 crosses of corn got ripe and sound. I had one bushel of ears of splendid corn. The peas and beans did very well. I have enough for seed of the Blush Potatoes. One hill had 52 tubers which weighed 9 pounds 14 ounces. The Garden Treasures were treasures indeed. L. R.

Missouri.

WATKINS, Dane Co., Dec. 16.—This is an average county, 25 miles square. It has been organized since 1841. It has 13 post offices and five churches in the county town: Greenfield, owned by the Methodists, Cumberland Presbyterians, Presbyterians, Campbellites and Baptists. There are 75 districts, which have four to six months' school each year. Our jail is empty about half the time. Serious crimes are extremely rare. Settlers are about four to the square mile outside of the towns. Land ranges all the way from $10 to $75 per acre. The average crop of wheat is 15 bushels. Corn, in a moderately good season, makes 40 to 50 bushels per acre. Grasses all grow near by.

D. J. M CM.

Nebraska.

NELIGH, Antelope Co.—Some pieces of corn, usually on fall plowing, have turned out very well—about 55 bushels—while that on spring plowing was 25 to 30 bushels. Quite a large lot of sorghum in this section was wasted, on account of neglect till after frost. More land was plowed this Fall than usual, as crops are heavier on fall plowing. Many farmers are going largely into stock-raising near here. Potatoes are almost a failure, on account of a dry spell in August, and corn was light on account of wet weather in September.

A. F.

New Jersey.

HARBOURTON, Mercer Co., Dec. 21.—Late in the Fall of 1884 I drilled in half a bushel of Diehl-Mediterranean Wheat in half an acre of ground, drilling 150 pounds of Mapes' A Brand with it. The Winter and Spring of 1884-5 were very unfavorable for wheat, and as my half bushel was sown very late, it had a hard time, but I got about five bushels of clean, nice, plump grain. The Flageolet Beans came up nicely and set quite full, but the beans were much smaller than the seed I planted, and white or whitish, instead of being green like the seed. The Rural Corn turned out mostly Blount's Prolific. Present prices are as follows: wheat, $1 per bushel; corn, 40 to 44 cents; potatoes, 50 to 60 cents; oats, 35 cents for 30 pounds; apples, 50 per bushel; butter, 30 cents per pound; eggs, 55 cents per score; good Timothy hay, $20 per ton; rye straw, $20 per ton. H. J. B.

WESTFIELD, Union Co., Dec. 21.—The Rural Beans came up and grew well and were prolific. We ate some and found them good, but not so good as the Limas. Most of the corn came up and grew well. I cut some of the yellow flint and early dent on September 8th, and the other sorts as they ripened. All got ripe. The peas of both kinds grew well, but owing to dry weather they did not fill so well. I raised 90 tomato plants, some very fine. The Garden Treasures did not do well—too dry just after they were planted. C. R. W.

New York.

JOHNSON'S, Orange Co., Dec. 20.—Orange butter and Goshen butter used to be familiar names in the market reports; but these names have passed away and linger only in the memory of the "oldest inhabitant." The reason for this is simple—the butter makers, upon the advent of railroads, became milk producers and sent their product to New York. This used to be a profitable business; but in later years, with the extension of railroads and the aid of refrigerator cars, milk is shipped great distances and the market is flooded, causing prices to rule low nearly the entire year, so that there is little profit in the "milk business" now, and producers are on the "ragged edge" as they see but little prospect ahead of any permanent improvement in prices. Owing to the great scarcity of milk just now, the farmers get four cents a quart, which is an outside figure and will be maintained but a short time, as this price generally brings a flood of milk, and prices begin to drop till two cents are reached, a figure discouraging to farmers who are badly in debt or have heavy rents to pay. The hay crop was very short, and mows looked very open in the beginning of Winter, but large areas of drilled corn were planted to "piece out," the hay crop. The corn crop was fair, a good deal of it extra good. The oat crop was light on account of dry weather. The wheat crop was almost a failure, having been winter-killed, but the fall sowing got a good growth and goes into winter-quarters in good shape. A good many farmers in this immediate vicinity are also engaged in the culture of small fruits to quite a large extent, and find it profitable, as prices generally rule high in the local markets. We have a farmers' club, known as the "Westtown Farm and Garden Club," whose proceedings are largely printed by three county papers. A great deal of interest is manifested in these meetings, both of a business and social nature. Once a year, for three years, there has been a strawberry reunion supper when the products of the club are exhibited, especially strawberries; and in the Fall, for two years, there has also been a harvest-home supper. The social part is what contributes so largely to its success. The business meetings are held once each month, when the moon is full, at the houses of different members, and are largely attended. The club was originated by the Rev. J. B. Fisher of Westtown, who also is the President. Much good is already noticeable as the results of his efforts. M. H. C. G.

Pennsylvania.

BADEN, Beaver Co., Dec. 22.—Wheat was a poor crop; corn a good one; oats ditto; potatoes a light crop; apples a big one, although this is an "off" year for this section; hay a light crop. Prices are as follows: Wheat about 90 cents; corn 50 cents; oats 35 cents; hay $15 to $20 per ton; potatoes 70 cents; apples $1 per barrel. Several apple buyers are picking up all the apples they can get at 75 cents per barrel. One said he had bought over 10,000 barrels in this country so there must be a sale for them somewhere, although the farmers are told that the apples can hardly be sold for any price. There is considerable excitement here now about natural gas. Several large wells and some small ones have been struck. About 30 or 40 wells are being sunk, and a great many others are in contemplation. Some of my neighbors laugh at me for paying $2 per year for a farmers' paper when one can be had for much less. I tell them that one number of the RURAL NEW-YORKER is worth a wagon-load of such trash, for the one number is sure to contain something useful, while the more of the trash a man reads the more he will be misled. But such papers as the RURAL will win at last. Farmers are getting more intelligent every year, and the cheap papers and their cheap readers will get scarcer as time goes on. F. W. S.

WATTSBURG, Erie Co.—The past has been a poor season for farmers and dairymen, as crops were rather light and prices low. This being a poor wheat country, my Diehl-Mediterranean yielded only eighteen bushels per acre. I think it a very good kind, though it seems more inclined to rust than some other sorts; it makes an excellent quality of flour. Spring wheat could not be got in early and is

a light crop. White Russian seems to do the best of any. Oats a light crop; the Welcome so far as tried, seems to yield well; but it smuts worse than other kinds. Potatoes half a crop on account of poor season and rot. Dakota Red yielded most and rotted least. The White Elephant yielded about the same as the Late Rose, but rotted worse. The Rural Corn did very well, nearly all ripened. I have not fairly tested the quality of the Carter's Stratagem and Prince of Wales Peas; but think the latter a promising variety.

W. T. M.

Utah.

ASHLEY, Uintah Co., Dec. 14.—The Johnson Grass came up finely and grew to the hight of five feet. We got a pint of seed, and if it stands the Winter we will sow the seed in the Spring. We got good returns from the Flageolet Beans, also from the peas. The tomatoes set well, but did not get ripe before the frost caught them. Most of the 50 varieties of corn were too late: but some got ripe, and I expect to plant all next year. J. S.

Wisconsin.

REEVE, Langlade Co., Dec. 20.—The Rural Peas were splendid. I think the Prince of Wales the best. The Garden Treasures were fine; my wife and granddaughter obtained a great deal of pleasure from them. The corn is too large for this country. Some stalks were 10 feet high when frost caught them. Some had a few nubbins. B. F. L.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time.]

PEA-FOWLS; PEKIN DUCKS; FRUITS FOR NEBRASKA.

R. I. E., Worden, Neb.—1. How often do pea-fowls hatch? What are their habits? Are they easily raised? 2. Who has bronze turkeys for sale? 3. What sort of ducks are the White Pekin and where did they originate? 4. What sort of apples are best adapted to Northern Nebraska? 5. Would pears and plums do well here? 6. What sort of plum is a blue and a white variety, the fruit of which grows in clusters along the limbs?

ANS.—1. Pea-hens lay from 12 to 20 eggs and raise only one brood a year. In a domesticated state they agree well with all turkeys, but not always with other poultry. It is necessary to protect them from cold in our northern Winters. Barley is the food commonly given to them, and to this may be added millet and other grains and leguminous vegetables. The females are apt to neglect their eggs and young, hence, in hatching, the services of a hen turkey are generally required. For young pea-fowls, the best food consists of "ant-eggs," barley-meal paste, mixed with sweet curd and hard-boiled eggs chopped fine. The young do not attain their full plumage until the third year. They are about as hard to raise as turkeys, to which they bear a strong resemblance in habits. 2. R. Vanderhoven, Rahway, N. J.; Jas. D. Cass, Beloit, Wis.; J. W. Janney, Waynesboro, Ohio.. 3. The Pekins are a Chinese breed of duck. They mature early, often laying when five months old, are white in color, with yellow bills and legs. They often attain a weight of ten pounds each. They will sometimes weigh five pounds when ten weeks old. They are easily kept, and require no water except a trough or tub for bathing purposes. 4. Write to Prof. J. L. Budd for the Russian varieties which he has. The Wealthy, Oldenburg and Tetofsky have been often recommended for that latitude, but last Winter destroyed nearly all. 5. The native plums do best; in fact, there are no others that can be recommended for that climate at present. DeSoto, Forest, Garden, Kirke's are the best of these. Archangel, Bloodgood and Flemish Beauty are the only pears we would dare mention, and these we would not recommend. There are some of the Russian sorts that may do better. 6. The Damsons, both blue and yellow, grow as you mention.

PRESERVING POSTS, ETC.

J. D. F., Salem, W. T.—1. What can I apply to wood to render it more durable as fence posts, as the pine and fir which we are compelled to use will decay in about two years? 2. Can I make a good barbed wire fence with posts 30 feet apart? Will the Mammoth Clover flourish on drier soils than the Medium Red?

ANS.—1. If the posts are cut and split, or even peeled, and allowed to thoroughly season, much will be added to their durability. If, after they are seasoned, they are saturated with gas tar, their durability will be greatly increased. Where many are used, or where a neighborhood combines, it will pay to procure a vat or tank made of sheet iron, as large as desired and deep enough to come up higher than the post would go in the ground; this tank should have a wide flange around the top, made on a slant upward, so that the tar will not run over and take fire. The tank is placed on an arch or temporary furnace, the posts are stood in it so as nearly to fill it; a few gallons of tar are added, and a slow fire is made. Enough tar should be used so that it will boil up and fill the tank and saturate the post for the whole length intended to go in the ground. 2. This distance will do well, except where it is desired to fence against hogs, in which case two strips, 1½ and two inches, can be put between each pair of posts, and the strands be stapled to them. 3. The Mammoth Clover makes a stronger growth and will do rather better on the drier soils, as its roots run somewhat deeper.

COTTON-SEED MEAL, BONE DUST AND GUANO.

J. F., Gonzales, Tex.—What would be the comparative value of cotton-seed as against a compound of three parts of bone dust and one of guano? Our only available manures are Post Oak ashes as gathered from the houses, and the above.

ANS.—One ton of cotton-seed would contain about 280 pounds of oil, which has very little manural value, being mostly carbon and hydrogen. It also contains about 920 pounds of hulls, which are composed mostly of vegetable fiber, with about 46 pounds of ash, of which 26 pounds are potash, and 90 pounds are phosphoric acid. It also contains 800 pounds of meal, containing 56 pounds of nitrogen, 23 pounds of phosphoric acid and 12 pounds of potash. The ton, then, contains 56 pounds of nitrogen, 113 pounds of phosphoric acid, and 38 pounds of potash, and is worth, at present prices, somewhat over $20. One ton of the mixture would contain 1,500 pounds of bone, with 375 pounds of phosphoric acid and 45 pounds of nitrogen. The 500 pounds of guano would contain about 35 pounds of nitrogen, 75 pounds of phosphoric acid and about 15 pounds of potash, so that a ton would contain 80 pounds of nitrogen, 450 pounds of phosphoric acid, 15 pounds of potash, and be worth $41. But the bone of the mixture would not be in a form to benefit the crop as quickly as the seed, and it would be deficient in potash. By comparing the above valuations with prices, a good idea of which to buy can be obtained.

INSECT INJURING GRAPE-VINES.

Subscriber (address mislaid) sends specimens of a vine injured by an insect and asks what it is.

ANS.—The gum has exuded, much as it does from a cherry or peach tree that has been similarly injured, and rests as a large mass about the tunnel, concealing the perforation. In every case the insect has disappeared, so we are unable to state what particular insect did the mischief. The tunnel is about the diameter of a common match, and extends at right angles to the surface, reaching to the pith, where it ends. The insect may be Sinoxylon basilare, Say., a beetle which sometimes bores into grape-vines, as well as into apple and peach twigs. We do not think such small, short tunnels can be a very serious injury to the vines, though they might become so, if sufficiently numerous. In case it were practical, the remedy would be to cut and burn the twigs while the insect was at work; but we fear this will not be practicable.

ABOUT PEA CULTURE.

E. C. B., Wilmington, Vt.—1. What is the best method of raising peas by the acre? 2. Which are the best kinds? 3. Is it necessary to sow some other grain with them to hold them up?

ANS.—1. Peas may be sown on grass sod turned down in the Fall or Spring and well fitted just before sowing, and unless quite rich, it should have a liberal dressing of manure cultivated and harrowed into the surface soil, or they may follow potatoes or corn the year before. Where chemical manures are used, phosphatic and potash manures have the greatest effect. They do best sown with a drill, and from two-and-one-half to four bushels per acre should be used, according to the kind and the richness of the soil. 2. The little Canadian Pea is much used for field culture; so also is the Black-eyed Marrowfat. 3. Where the ground is smooth and rolled after sowing, there is no necessity of sowing other grain to hold them up; but where oats are sown with them, and they are cut as soon as ripe and well cured, the fodder is worth as much as a crop of Timothy hay. Will our Canadian friends tell us how they raise peas?

OIL-MEAL.

M. H. L., Salem, Mass.—1. Is there a difference between cotton-seed meal and the new process oil-meal the RURAL so often mentions? 2. If so, which is the more desirable as a food for milch cows?

ANS.—1. Yes, one is the residuum of the cotton-seed oil mills of the South, and contains a large per cent of free oil (often as much as 17 per cent.); the other is the residuum of those mills making oil from flaxseed by a new process, in which instead of being extracted by pressure as in the old process, it is floated out with a solvent which is afterwards driven off by heat. This contains only about two to three per cent. of free oil. 2. We greatly prefer the new-process for use where the milk is used for making butter, as so much oil as is contained in cotton-seed meal or even old-process oil meal is almost certain to give the butter a disagreeable, oily taste. Very many of the mills in the West now making linseed oil, use the new-process, so there should be no trouble in obtaining it. If you write to the Detroit Linseed Oil Works, they will tell you where it can be had and quote you prices.

LIME.

A. A. (address mislaid.)—1. Can the stone commonly used for hydraulic cement be so burned as to be used as quick lime for making mortar? 2. Can quick lime be used for any other purpose than for mason's use?

ANS.—1. No, the stone from which hydraulic cement is made contains magnesia, or is what is called magnesia limestone, and hardens quite rapidly when mixed. Ordinary quick lime is made from carbonate of lime. By burning, the carbonic acid is driven off, and by the addition of moisture it slakes or crumbles to dust. Magnesian limestone needs to be ground to reduce it to powder. 2. Yes, it is used for fertilizing and various other purposes.

Miscellaneous.

J. R., Columbus, Ohio.—1. Where can I get good spring wheat for seed? I wish to try it here on clay soil, as our winter wheat freezes out badly? 2. Will it do to plow in the Fall, just before freezing up, for oats and corn, the ground to be well pulverized in Spring by going over it three times with the Acme Harrow? 3. Is the little book "Tillage is Manure" published by Nash Bros. reliable? 4. Where can I get the best yielding oats and what is the price of the seed?

ANS.—1. Of any large dealer in seeds. Probably of Livington's Sons at Columbus. Certainly of Ferry & Co., Detroit, or of H. Sibley & Co., Chicago. We could not advise as to the best kind for your locality, climate and soil. If they have not been raised in your neighborhood, try several in a small way. 2. Such fitting of the soil would be capital for oats; but we would always prefer spring plowing for corn. 3. It is a very good little book and will pay for a careful reading. Few of us understand the importance of thorough tillage both in fitting the soil before seeding and in tending the crop. We don't quite believe that tillage can take the place of manure, though it will aid the soil to do its best for the fertility it contains. 4. Of the same parties that have the Spring wheat. The prices we could not give. The Welcome or White Australian is a good, heavy, early oat but not a large yielder. The American Triumph and White Russian are larger-growing and better yielders, but later.

J. S. P., Brockport, N. Y.—1. Where can I get J. J. H. Gregory's work on fertilizers? 2. What other good works are there on the same subject?

ANS.—1. Of Mr. Gregory, Marblehead, Mass. It is mentioned in his catalogue among a list of other works on agricultural matters. Harris's Talks on Manures, $1.75; Harlan's Farming with Green Manures, Johnson's How Crops Feed and How Crops Grow, $2 each, are good works on the subject. All can be got through the nearest book dealer or the American News Company, this city.

H. C. B., Poteau, Ark.—My farm is on a river much given to overflow and with a rapid current; it is much damaged by washing; how can I protect the banks except by a levee, and that is expensive?

ANS.—With so rapid a current we doubt whether a levee would stand against the wash. We suggest the planting of a thick row of cotton wood or willows close along the bank; if if they once get root-hold nothing could move them.

P. T. M.—What is the address of the Agricultural College, of Nebraska?

ANS.—Lincoln, Neb.

E. K. T., Burlingame, Kans.—The specimen sent is a common intestinal tape-worm—Echinorgnchus gigas.

J. B. McG.—Dog powers for churning are made by the Vermont Farm Machine Co., Bellows Falls, Vt.

DISCUSSION.

WEANING CALVES.

J. M. S., QUINCY, ILL.—In the Farmer's Club, page 859, D. H. P., Auburn, N. Y., recommends that the calf should be taken from the mother when only 12 hours old. All my experience contradicts his assertion that when the calf is taken from the mother when 12 hours old it will learn to drink more readily than if allowed to remain with the mother until three days old. Since I was nine years of age, it has been my work to wean the calves on rather a large stock farm, and I have weaned several hundreds. For the first few years I adopted his plan of teaching the calf to drink when 12 hours old and had much trouble. I then became convinced that it was better to allow the calf to suck the mother until it was several days old, and since doing this I have not experienced one per cent. of the trouble in teaching the calf to drink, that I had before. D. P. H. says that if the calf be taught to drink when 12 hours old, there will be no sore teats and no bellowing by either cow or calf. As to the bellowing, his assertion is *prima facie* incorrect; and if the matter is properly managed, the calf can be allowed to suck the mother for a week and yet there will be no sore teats, and no more bellowing than if it is taken from the mother at 12 hours of age. My plan is this: As soon as the calf has filled its stomach, it is put in a stall or inclosure separated from that of the mother by a rail or board partition in which there are cracks. This allows the mother to see the calf and to nose and lick it when it comes up to the partition, and neither shows any uneasiness. Every six or eight hours the calf is turned in with the cow and allowed its fill, when it is returned to its inclosure, and the mother's udder is drawn clear and the teats wiped dry. When this is done the teats do not become sore and the swelling of the udder is more rapidly reduced; for allowing her calf to suck puts the cow in a good humor and she will give down all her milk readily, permitting you to draw the udder cleaner than if the calf has not been allowed to suck. When the calf is four or five days old it has become strong and accustomed to its surroundings, and if allowed to become quite thirsty it will, in a great majority of cases, *drink* milk from a bucket without any hesitation and without your giving it your finger to suck. Never give the calf your finger if it can be avoided. If the calf refuses to drink, back it into a corner and while you hold it with your left hand, dip your right hand into the milk and insert the middle finger into the calf's mouth. The calf will suck your finger, then lower your hand into the milk and the calf will suck it up by sucking your finger. As soon as it sucks nicely, withdraw your finger. This is rarely necessary when the calf is allowed to suck the cow until it is a week old, and nearly always necessary when the calf is only a day old. When the calf has learned to drink, separate it altogether from the cow. Instead of their bawling more, they will bawl less than if the calf is taken from the cow when only 12 hours old; for the mother's solicitude for the calf and the calf's attachment to the cow weaken with time. Many a cow that is "almost distracted" if separated from the calf when it is only a day old, will go off and apparently never think of it if the calf is a week old; and the concern of the calf diminishes as rapidly with time.

BLACKBERRIES.

A., OCEAN COUNTY, New Jersey.—In a late RURAL you give a very full list of 20 sorts or more, I believe, with the opinions of many cultivators of them, from different parts of the country. This is highly useful information to your readers, and after this they can more understandingly select such sorts as may prove best for each particular soil and climate. I have tried various kinds for years past on a light, gravelly soil, but none prove nearly equal to the Kittatinny. This is a vigorous grower with me, hardy and an abundant bearer of the largest sized berries, and if allowed to perfectly ripen before being picked, they are sweet and luscious. But in this stage they are a little too soft for shipping any distance, so that those buying them in the market cannot judge as to their real goodness, for they have to be picked a few days before fully ripened, in order to bear transportation well. But this is the case with all sorts of berries, plums, peaches and most other kinds of fruits.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JANUARY 9, 1886.

SOME 20 articles have been selected for the second Potato Special of the RURAL, which will be published about Feb. 15.

ALL perishable plants or tubers which our friends desire us to test, should be sent to the Rural New-Yorker, River Edge, Bergen Co., New Jersey, not to this office. The name and address of the sender should be written on the package.

THE Potato Special will be dated the 16th instant as promised. We have worked better than we knew, having received contributions enough to fill two papers. We extend our thanks to all.

No one should fail to look carefully over the list of presents, which we shall distribute next May-Day. An opportunity to get so much value for so little effort, doesn't often occur. Some people will get them for so few subscribers and so little effort as to surprise even themselves.

WE have articles enough (thanks to many friends) to fill at least TWO Potato Specials. The first will appear next week with a four-page supplement. The second, in time to be serviceable for planting the next crop. Perhaps this will please our readers better than to devote our pages two weeks in succession to this subject.

THE Jewell Strawberry received very high praise at the meeting of the New Jersey Horticultural Society held at Trenton last week. It was conceded by all to be the most promising berry now being introduced, and was put upon the list for extended trial without a dissenting vote. This only corroborates what we have said of it. We really want every one of our present subscribers to try it. This they can do at no expense beyond a few moments' work, as we shall be most happy to send eight plants, direct from the originator, P. M. Augur, to any old subscriber who procures us a new one. You can thus benefit yourselves and us at the same time. Isn't this worth an effort?

WE shall soon begin to notice the catalogues of seeds, implements, etc. for 1886, sent to this office by the leading firms of the country. As usual, we advise our readers to send for them, compare them, make inquiries as to the firms sending them out, to the end that they may purchase goods of the best quality, and at the lowest cost. Our several farms and the experience of many years in testing all kinds of plants, seeds and implements, whether new or old, should enable us to aid our friends in making their selections; and this, as has been our custom, we shall endeavor to do, by calling attention in a thoroughly impartial way to the notable features of the catalogues received.

WE have so often advised our friends to go slow in disposing of their flocks of sheep, because of the low prices of both meat and wool, that we have sometimes feared they might think we were trying to bore them. But those who have heeded our advice and tenaciously held on, weeding out the flocks, and in every way improving those kept, are in fair way to be thankful that they have done so. The wool market is getting stronger, and prices are better, and we are quite sure that the price of mutton will be higher before Spring. Meantime every sheep owner should strive in every way to improve his flock, both in fleece and carcass. There is not the least danger of their getting them too good.

IN England, where horse shows are numerous and well attended, there is a growing tendency to exclude over-fed and extremely fat animals from competition. This seems like a good move. Too many judges, at shows of this character, are influenced by a fat, sleek appearance, and frequently overlook finer points in less well-rounded animals. It is the duty of the breeder of animals for a fat stock show, to cover his beasts with all the tallow and meat they can carry. The prize animals are seldom used as breeders, and it is doubtful if, as individual animals, setting aside the prizes they obtain, they pay for the care bestowed upon them. They serve to show what can be done by forcing, and they enhance the value of the breeding stock of the owner. It is different with draft horses. Those exhibited at show rings are to be used chiefly for breeding purposes, and fat, over-fed animals are notoriously poor breeders. An extra quantity of soft fat is out of place in a working animal. We would as soon think of a fat man trying to win a running match. We hope the tendency to breed fat and awkward horses will be done away with.

A CONSIDERABLE number of the cattle kings who had illegally fenced in large tracts of the public domain, have removed the obnoxious fences in compliance with the President's proclamation of last August. Others have failed to do so: while a few have not only refused to remove the illegal fences already up, but have actually added to them. A number of arrests of recalcitrants have been made in New Mexico, Colorado and Wyoming, and a number of warrants have been issued for others in Kansas and Nebraska. There is, on the side of the authorities, a resolute determination to deal promptly and vigorously in this matter. The public land is for the public, not for cattle kings or syndicates, native or foreign, or for railroad corporations, or any other land-grabbers. All efforts to preserve the lands for their legitimate purpose, or to restore them to it, should be heartily approved by the public press, especially by the agricultural part of it, for the agriculturists of the nation are the chief gainers thereby. Of course, it is the bounden duty of the government officials to enforce the law in this matter: nevertheless, their hands are strengthened and their hearts encouraged by public approbation of their action.

IN addition to the manufacturers and dealers of bogus dairy products, the assailants of these concoctions are beginning to find other opponents in the raisers of hogs and beef cattle, as the growth of butterine and oleomargarine is thought to enhance the value of these animals by the greater demand created for portions of hog and beef products. At the recent Fat Stock Show at Chicago, the exhibitors of bogus butter, in their successful attempt to obtain permission to exhibit their goods, received no little support from that section of cattle and hog exhibitors who had little or no interest in dairying, and we notice that at several recent meetings of live-stock men, resolutions have been passed commending the action of the State Board of Agriculture in admitting the concoctions. If the exhibition of them tended to advance the interests of fat stock, why were they not shown in the fat-stock department, instead of in the department devoted to dairy interests, which they confessedly injure? But even the hog and beef cattle raisers, like all other honest men, must join with us in denouncing every effort to sell oleomargarine and butterine as genuine butter by manufacturers or wholesale or retail dealers. We demand that artificial butter shall stand on its own merits, and to prevent error and fraud, that it shall have a distinctive color.

THE value of a really independent paper, one conducted by honorable, upright men, and backed up by capital enough to render its editorial opinions free from bias by the advertising department, may be inferred from revelations just made by a Senate investigating committee with regard to the hidden sources of certain manifestations of the "power of the press" in this State. During the last session of the Legislature there was a remarkable agreement of opinion among a large number of the journals of the interior, belonging to both parties, regarding the unadvisability of legislation hostile to the interests of the gas companies.

It turns out that the editorial outpourings of no fewer than 37 newspapers in country places were inspired by a single mind. Four articles, two for Republican and two for Democratic papers, were prepared by a writer in the employment of the consolidated gas companies, and the insertion of the articles as editorials was procured by an advertising agent! Among flagrantly extortionate monopolies, the gas companies hold a foremost place. How dangerous to the public welfare the corrupting power of such unscrupulous corporations. East, West, North and South, with those who make and those who should execute the laws, and even with those who should impartially, honestly and fearlessly criticise both and hold them strictly to their duty.

WE WANT

a large number of sketches for 1886 from our readers, for which we propose to pay our regular price for such matter, as the illustrations *appear* in these columns. It matters not how rudely the sketches are drawn, if only our artist can understand them and the descriptions which accompany them. The sketches desired are those of *any* contrivance whatever which will save labor or promote economy or comfort, whether for man or beast. For the farm, garden, orchard; for the barn, stable, shed, corn-crib, carriage house, tool-house, granary; for the pig-pen, poultry yard, poultry house, chicken coop; for the sheep, cattle, swine; for the house, kitchen, laundry; for wells, pumps, well-houses, ice-houses, we want sketches for illustrations. We want sketches and plans of farm houses, dairy houses, and all sorts of farm buildings; of every sort of tool or implement used in country life; of anything, in short, which may help in any way the farmer, the farmer's wife or children, and all who work the soil either for pleasure or profit. Go to your neighbors and see if they cannot help you; see if they have nothing upon their premises which you would like, and which you think would be worthy of being illustrated in the RURAL NEW-YORKER. We do not ask or expect artistic sketches or good writing. We only ask for legible writing and for sketches which may readily be understood. Photographs of any of the above will be acceptable.

LAND COMMISSIONER SPARKS.

A GREAT deal of discontent exists all through the far Western States and Territories at the course of Land Commissioner Sparks in regard to land entries. The chief charges against him may be briefly summarized thus: He has announced that 75 per cent. of all the entries are fraudulent; and consequently that 75 per. cent. of those making them are rogues, without any proof. He has suspended action on 40,000 entries until their legality shall be decided, thus bringing a vast amount of distress on a large body of settlers who can raise no money for the improvement of their land or for supplies while their titles are in doubt. He has changed the rules relating to public entries, so that a horde of his agents may rob the settlers by threats of prosecution. He has sought to set aside by his rulings the settled land policy of the nation, by declaring null entries under settlement laws, which for 25 years have been considered good evidence of title and upon which the authorities of States and Territories have taxed lands so entered. He has vilified former officials as rogues from party rancor. In addition to ignorance of the land-laws and their administration, he has an ungovernable temper and a vicious tongue. A charge of fraud he considers a proof of fraud, and an assertion in the matter he at once proclaims a fact. Some of his decisions have been so oppressive to frontier industries, that they have been overruled or modified by the Department of the Interior.

The Commissioner maintains that the clamor against him, which is loudly heard in all the public-land States and Territories, comes from greedy and dishonest land agents, money lenders and land-grabbers of all kinds and their henchmen in the office, the counting-room, the farm and the press: and that honest settlers silently approve of his course, while the dishonest make all the uproar. There has been a vast amount of dishonesty in Western land occupation. A great deal of what the Commissioner says is undoubtedly true; but the complaints are too numerous, wide-spread and unpartizan to permit the supposition that his course has always, or even generally, been judicious or just. A more prudent Commissioner could easily be selected; a more unpopular one could hardly be found.

THE RURAL'S Special Contributors For 1886.

With a Revised List of the Subjects to be Considered.

(ENGLAND.)

SIR J. B. LAWES.
Subjects not as yet decided upon.

PROFESSOR J. P. SHELDON.
Dairy and Stock Notes.

JAMES SINCLAIR.
General English Farm Notes.

(UNITED STATES.)

PROFESSOR G. E. MORROW, ILLINOIS.
1. A series of short articles on The Principles of Breeding and Improvement of Animals, with Descriptions of Breeds and their Adaptations.
2. Notes on Live Stock in general.

GEN. CASSIUS M. CLAY, KENTUCKY.
How Live Stock may be Improved.

GEN. W. H. NOBLE, CONNECTICUT.
Rural Adornments and Comforts.

PROF. THOMAS MEEHAN, PENNS'A.
The Relation which Water bears to Successful Culture.

MAJOR HENRY E. ALVORD, Houghton Farm, NEW YORK.
1. A Noteworthy Change in Public Opinion regarding the Bureau of Animal Industry.
2. The Prospective Increase in the Factory System of Dairying, as the Result of Competition from Substitutes for Butter.

C. A. GREEN, NEW YORK.
Improving a Run-down Farm. (Continued.

WILLIAM FALCONER, LONG ISLAND, NEW YORK.
1. The Flower Garden.
2. Ornamental Trees and Shrubs.
3. The Window Garden.
4. The Greenhouse.
5. The Vegetable Garden.

PRES. T. T. LYON, MICHIGAN.
Horticultural Matters viewed from an Amateur's stand-point.

F. L. KILBORNE, B. V. S., WASHINGTON.
Veterinary Topics for the Farmer's Consideration.

T. H. HOSKINS, M. D., VERMONT.
1. Vegetable growing: especially the Testing and Improvement of Varieties.
2. Artificial Fertilizers. Which are the Best and Cheapest for the Crops Grown.
3. Fruit Culture—especially for the Cold North.

DR. C. V. RILEY, WASHINGTON.
1. Bees *vs* Fruit.
2. Mildew on Grape-vines.
3. The Best Remedies against Scale Insects.
4. Special Insects of Interest.

DR. W. J. BEAL, MICHIGAN.
The Structure of a Blade of Grass in two or three articles.

PROF. R. C. CARPENTER, MICHIGAN.
1. House Drainage as Applying to Farm Houses.
2. Water Supply for Farm Houses.

PETER B. MEAD, NEW YORK.
Horticultural Notes under a *nom de plume*.

PARKER EARLE, ILLINOIS.
1. Matters Pertaining to Distant Markets.
2. Better Distribution of Fruit Products.

P. M. AUGUR, CONNECTICUT.
High Fertilization and Culture as Affecting the Growth and Fruitage of Plants on the Basis of Economy.

PROF. A. J. COOK, MICHIGAN.
1. New Points of Value in Bee-keeping.
2. Principles in Stock Breeding and in Stock Feeding.
3. New Injurious Insects and New Remedies.

PROF. I. P. ROBERTS, NEW YORK.
Recuperative Agriculture, more especially adapted to the South.

PETER HENDERSON, NEW JERSEY.
Potatoes—Large or Small Sets.

JOHN THORPE, NEW YORK.
Seedling Chrysanthemums, Pinks, etc.

JAMES TAPLIN, NEW JERSEY.
The Comparative Value of the Newer Roses.

HON. F. D. COBURN, KANSAS.
A series of articles on Matters connected with Beef Cattle, and Beef Making.

Prof. W. W. TRACY, MICHIGAN.
A series of articles on the Testing, Introducing, naming and describing of Varieties of Vegetables.

PROF. E. M. SHELTON, Kansas.
Subjects not yet decided upon.

IN GENERAL

we may say that all of the RURAL'S regular contributors will continue with us during the year.

BREVITIES.

THIS year we shall probably be unable to supply back numbers for any length of time.

IN the last Congress, out of 360 members only six were farmers, while 264 were lawyers and 27 bankers. Certain bald statements are too suggestive for comment. Without a lawyer or a banker, this country would flourish; without the farmer it would perish. Only six men to represent the twenty millions the effects of whose labors bring prosperity or adversity to every class and industry in the land!

MR. PUTNAM from Cambridge, Vt., writes, speaking of our new potatoes: "We must remember that what will do well on one soil will not do well on others. If that was the case with the seedling potato I sent you, I am anxious to know the truth, as I am convinced you can neither be bought nor sold, and will tell the truth and nothing but the truth."

SOME one suggests that when whitewashing is going on, it may serve for several uses besides those of whitening walls and preserving wood. In the cellar, it will not only increase the light by its reflections, but will check mold, especially if some copperas or sulphur is added. Some posts, stones, tree trunks, etc., if coated with it, show even in darkness, and serve as guides. With sulphur added, the lime wash is probably the best of all applications to the tree trunks in the orchard.

Pomological.

BEURRE FOUQUERAY PEAR.

THIS is a new variety of pear which has just been put on the market in France. It was originated by M. Fouqueray-Gauton, a well-known horticulturist of Sonzay, in the Department Indre-et-Loire, who has originated several other excellent varieties. This first fruited in 1880, and since then it has become very popular in that section owing to the beauty and high quality of the fruit.

The *Revue Horticole*, from which our illustration, Fig. 18, has been re-engraved, says the tree is a very strong grower, with upright, stout and long branches. Leaves large, tough and a bright green; petiole strong and of medium length. Fruit large, from nine to eleven inches in circumference, and from three-and-three-fourths to four-and-one-half in length; stem short, strong, in a rather shallow cavity, the margin of which is somewhat uneven; calyx large, and regular; skin smooth, fine, a trifle yellowish on the side exposed to the sun; often reddish, especially in trees grown espalier fashion. Flesh white, mellow, very rich; juice abundant and sweet, with a very agreeable perfume.

The Swineherd.

PIG DIET.

COL. F. D. CURTIS.

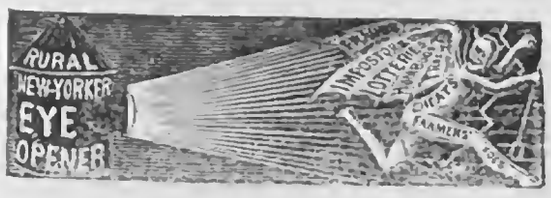
Barley and wheat as feed; wheat middlings; bran; pasture; food and manure; need of individual attention.

MR. A. C. CLARK, a model breeder and the originator and perfector of the so-called Cheshire hogs, told me a long time ago that the best food for sows when suckling pigs, was barley, ground entire, and mixed with milk or whey. Wheat is also excellent, and in these times a farmer can afford to save some to feed to his young pigs, especially when first taken from the mother. Probably there is no kind of grain which will come nearer to supplying the full ingredients of the milk. It must be fed carefully and but a little at a time. I should say a half gill would be ample for four hours' feeding with a gradual increase, as the animals show an inclination to eat and that it agrees with them.

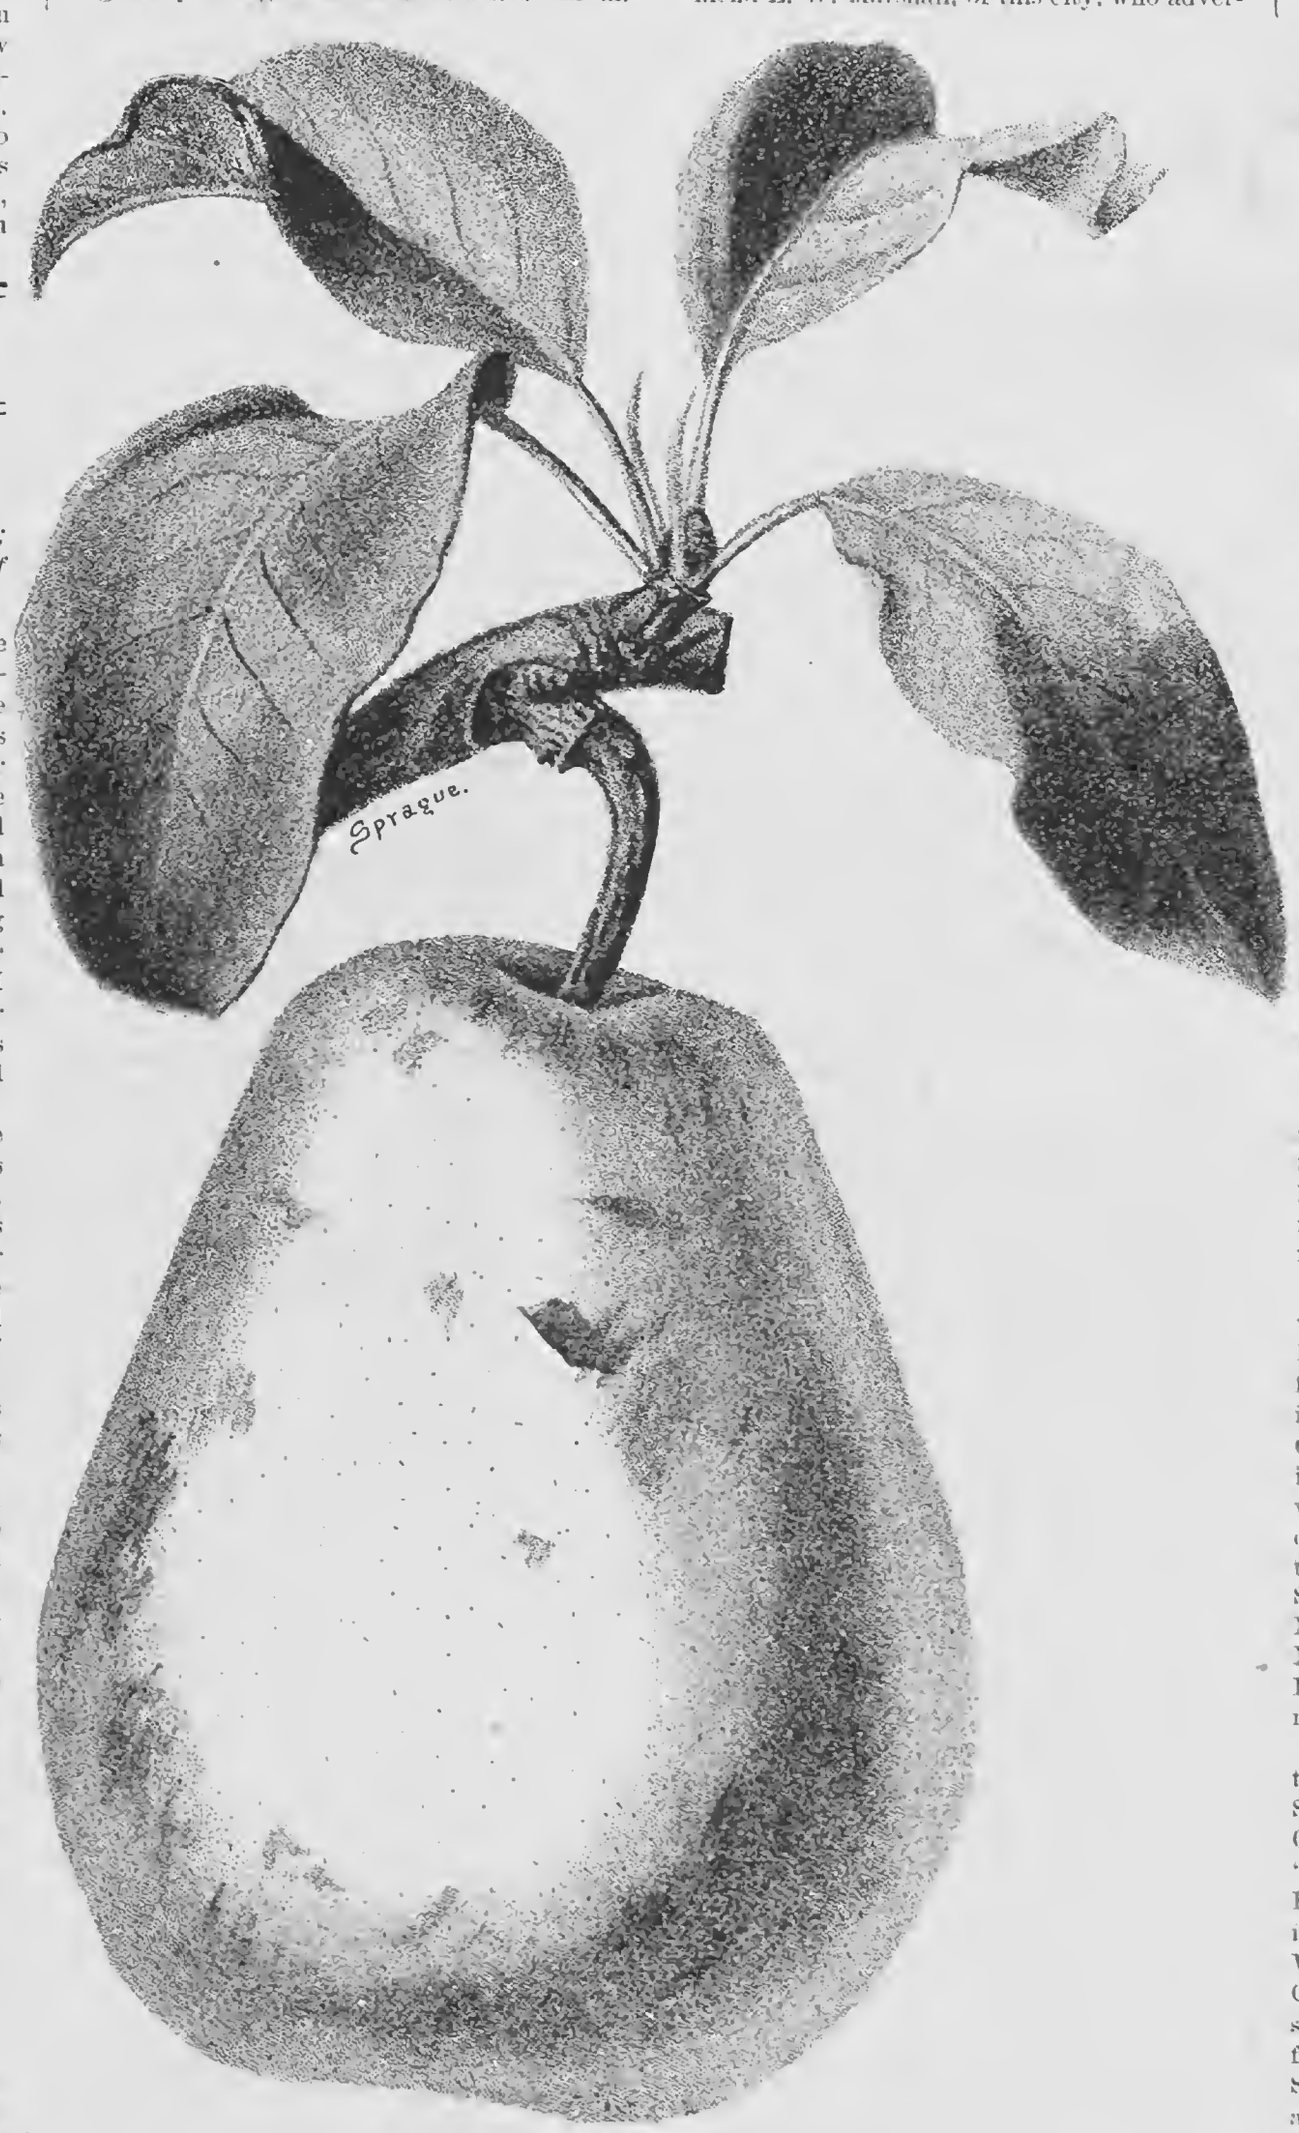
Wheat middlings are good, according to the quality. All bran, however, finely ground, is not just the thing. The farmer can, however, make it stronger and better suited to the wants of the pig by adding a pinch of corn meal or some coarse wheat flour. I should feed whole oats as a supplementary food to chink in and supply what the others lack. I am speaking of a no-milk diet.

When the pigs get older, and the time comes to crowd them more, or to fill up the muscles and tissues with fat and to make them grow, I mix wheat middlings and corn meal (two and one), and feed liberally of the mixture three times a day. They have the run of a good pasture and a few apples. The pigs do well, and have a uniform appetite, which is an indication of health. The old hogs certainly fatten very fast on this compound, and the best of it is, the meat will be more healthful than where the hogs have been stuffed on clear corn. They make twice as much manure, and the chemists tell us the pay for the middlings all comes back in the manure. Of course, we don't get in the manure all the food they eat; but what they do make is worth per pound all the middlings cost, weight for weight.

I wish some of the experimental farmers would tell us just how much is returned out of the middlings fed, in gain and in excrement—the per cent. of the amount eaten. Prof. Sanborn is the man to do this, as he is one of the most pains-taking and the most practical of all the professors. A considerable share in the thrift of pigs will arise from the owners watching things, to see how everything works. Changes must be made from time to time in food and surroundings, and *each* pig should be looked after individually; a general look won't do.



THE Seneca Chief and Red Line wheat swindles are of precisely the same stripe as the Bohemian oats fraud. They have been started recently in several counties in Ohio, Indiana and Michigan, and perhaps in other States also. The lot of the farmer who invests in them will certainly be like that of the dupes who invested in Bohemian oats. In Logan County, Ohio, alone, farmers are reported to be $200,000 out of pocket by the latter fraud, which is still worked vigorously. Many of the officers of the various associations made quite large fortunes out of the fraud. Although we have explained the *modus operandi* several times, we repeat it once more for the benefit of our host of new subscribers: A sleek, glib-tongued agent urges the farmer to buy a certain number of bushels of oats at $10 per bushel. The farmer very naturally objects to pay such a preposterous price. "You won't have to pay a cent down" says the sharper. "Just take 20 bushels and give me your note for $200. Out of the first crop we will buy 40 bushels at the same price, and give you a bond to that effect, and the note will not be presented till the bond is lifted." The prospect of thus doubling his money is often irresistible to the farmer, who signs the blank note presented to him, receiving, in return, a bond signed by the agent of the association. In all



BEURRE FOUQUERAY PEAR. Fig. 18.

cases the note given is negotiable, and is readily discounted by "note shavers," and having passed into "innocent hands" it must be paid. The agent, however, seldom complies with the bond by buying double the quantity of the farmer. This is occasionally done to gull more simpletons, or because oats are required to carry on the fraud. Just as in the grave-yard insurance swindles, a number of people of good standing in various sections have been tempted to engage as officers of the various associations. We have before us those of the Western New York, and the Northwestern Central Ohio Associations and the Bohemian Oat and Cereal Company, of Kenton, Ohio. There are a dozen other companies in Northwestern Ohio alone, besides a large number of others in most of the Western States. We very earnestly urge upon our readers to have absolutely nothing to do with such associations either as swindlers or dupes.

J. Coy, Hoosick Falls, N. Y., is evidently a cool sharper. He claims to be a partner in two large drug stores to open on January 15, one at Dallas and the other at San Antonio, Texas, and he advertises for help, and writes, to an applicant in this city, for a deposit to the amount of $200 to $500 as security for a situation worth $75 a month. It is a common trick of sharpers in cities to obtain a deposit from greenhorns as security in a situation and then to clear out; but this is the first occasion of which we have ever heard where the fellow had the assurance to ask that the cash should be forwarded to him.

TO SEVERAL INQUIRERS. — Pulvermacher's galvanic belts and bands are as good as any we know of; but, like other advertisers, the concern is very likely to exaggerate the merits of what it has to sell. . . . We do not recommend E. W. Marshall, of this city, who advertises, both in the press and through the mails, employment for women in making worsted work and laces, the materials for which, together with an "outfit," the workers must first purchase from the concern, which offers to buy at a fair figure the manufactured goods. Judging from the advertisements, one would imagine the firm a large and highly important one; but it really occupies only a small hall room on Sixth Avenue. The stock on hand would be dear at $100. It makes a very large profit on the materials and outfits it sells, and pays very little for the work done. When we called to investigate, two women who had brought goods were bitterly upbraiding the young man who "runs" the concern for having swindled them. There are several other concerns of the same stripe in this city, and Sixth Avenue is a favorite location for them. . . . We have had several complaints that F. M. Lupton, of this city, has not forwarded books for which he received money. He says he is a trifle behindhand, as he cannot get the works ready fast enough; but that he will satisfy all claims before long. . . . We do not recommend the Renner M'f'g. Co., Philadelphia, Pa. . . We do not recommend the Home M'f'g. Company, of Boston. It offers to send 100 pictures and materials for coloring 500, with brushes, etc., for $1, and to pay $2 per 100 for the colored pictures. We have exposed several humbugs of this sort both in Boston, Philadelphia, Cincinnati and Chicago. We have received a multitude of complaints of such concerns, which make big profits in selling outfits, and always make an excuse for failing to carry out their engagements. The investment at first asked is so small, that many in need of home employment send on the amount; but in most cases more money is then demanded for other articles "necessary to success." A few pictures may be bought back at low prices, to be sold at high figures to fresh applicants, and then come complaints and refusals to purchase.

Miscellaneous.

WESTERN NEW YORK HORTICULTURAL SOCIETY.

WE are in receipt of the programme of this oldest of horticultural societies. The meeting will be held on Wednesday and Thursday, January 27 and 28, at Rochester. The list of subjects for discussion contains many of great importance to the horticulturists and, in fact, to all fruit eaters as well. Several essays have been promised, and all that can attend may be sure of a feast. The Secretary, P. C. Reynolds, Rochester, N. Y., will send the programme.

Literary.

MAGAZINES.

OVERLAND MONTHLY for January promises to be a number of special interest. "For Money," a new novel of California life, by Miss Helen Lake, will commence with this issue; "Golden Graves," a Christmas story, by Leonard Kip, a story of the mines, at Lower Bar; "An Autumn Ramble in Washington Territory," "Mr. Grigg's Christmas," by Kate Heath, a sketch full of love and pathos; Hon. A. A. Sargent, will write again of the "Chinee Problem;" these with other stories, also poems, book reviews, etc., all combine to make this a grand number.

HARPER'S MAGAZINE.—This number opens with a very interesting paper by Mrs. Lucy C. Lillie, entitled "Winter in Devonshire," and is followed by "East Angels," Part XIII, which is one of the best of novels. "Domestic and Court Customs," S. G. W. Benjamin, has 16 illustrations. "A Lampful of Oil" is a well written article about the first discovery of coal oil, and presents many facts of interest on the subject; is also fully illustrated. "Indian Summer," Part VII. W. D. Howells. "The Militia and the Army," Maj. Gen'l. Geo. B. McClellan. These, with Editor's Easy Chair; Editor's Drawer; make up the contents. It is richly illustrated.

THE CENTURY has for a frontispiece a portrait of Guiseppe Verdi. "The city of Teherân," S. G. W. Benjamin, is concluded. "The Crickets in the Field," Anthony Moorehead; "The Bostonians," Henry James; "Feathered Forms of Other Days," R. W. Shufeldt; "Typical Dogs—Pointers," John S. Wise and John W. Munson (a finely illustrated article); "The Cloverfield's Carriage," Frank R. Stockton, a story of Southern life; "Spiritual Preaching for Our Times," Edward Hungerford; "The Second Battle of Bull Run," Gen. John Pope; are some of the contents of this unusually brilliant number. There also are poems, the "Open Letters," "Bric a Brac," and "Topics of the Time."

For Women.

CONDUCTED BY MISS RAY CLARK.

A WOMAN'S TRIP TO LONG PEAK.

(*Continued.*)

AFTER about a mile of this steepest of riding, they turned to a little spring which trickled down the mountain-side, and halted. Here they unsaddled their horses, and left them to feed on the grass growing around the little rivulet.

The climbing was now to be on foot. Before them and on either side as far as one could see, stretched the Boulder Field. This is accurately named, for not a bit of soil of any kind can be seen on it—nothing but immense boulders piled in magnificent confusion. After a mile

of monotonous walking over this relatively level surface, they reached the Keyhole, just below which is the spot where the unfortunate Miss Welton met death. There is a wooden slab erected, bearing these words:—"Here Carrie J. Welton laid to rest, and died alone, Sept. 23d, 1884." A more desolate spot is inconceivable. Nothing but a solitary extent of reddish rocks can be seen in any direction, while through the Keyhole rush the winds, which have collected and gathered force on the other side of the mountain.

After passing through the Keyhole, which was done with caution on account of the gale blowing through there, they climbed along a narrow path, which led around one side of the mountain. During the night, it had snowed on the Peak, and the sun had not yet shone out enough to melt the ice on the rocks on that part of the ascent known as the Slide. Here they had great difficulty in climbing, as the rocks were so smooth as to afford scarcely any foothold, and in addition to this disadvantage, were covered with a thin sheet of ice. Add to these conditions the certainty that if a mis-step was made, it would occasion almost sure destruction, it will be seen that caution and skill were necessary. Moreover, it was very cold, and though all wore heavy winter flannels, their hands and feet which were kept wet, suffered exceedingly. At length by means of twisting their rubber circulars together, and helping each other along, the worst place was passed.

During this time the fog which had been quite thick when they started lifted at intervals, delighting the eye with the most enchanting views. After passing the "Narrows" we reach the "Last Scratch," as it is called, which at first sight looks like smooth rock with no chance for ascent. But there is a very diminutive creek which flows down it, fed by the snows above, and in the bed of this the party climbed.

The summit was reached just at noon. From this hight, 14,271 feet, the cities of Denver, Greeley, Cheyenne, and Fort Collins, are visable on a clear day. The atmosphere was now somewhat hazy, so that the towns could not be distinguished. North, Middle, and Estes Parks can be seen. We (for I was one of this party) looked down on inferior mountains, on the sides of which we saw several small lakes which looked wonderfully blue to our admiring gaze. Along the side of one was a huge snowbank, while another was covered with large blocks of floating ice.

The stillness was intense. We felt that we had actually left the world beneath us. We saw no signs of life around us save an attennated mosquito, which seemed to flutter forlornly about in hopeless search for some unlucky victim. On the verge of the Boulder Field we saw a solitary mountain quail, which was relentlessly pursued with stones by two members of the braver sex, but to the great delight of three members of the party the poor bird escaped. We found several varieties of flowers for a long distance in our ascent; in fact as long as there was soil enough to afford the most meager support.

We had barely finished our lunch when we were warned, by the ominous sound of thunder, of an approaching storm, and considering that "prudence is the better part of valor," we hastily prepared to descend. We paused long enough, however, for a short game of snowball.

Before we had gone half of the distance to the Keyhole the storm overtook us. We waited a little while under cover of a projecting ledge, and the hail then turned to snow, and finally cleared. When we reached our horses it was raining, but the weather became fine again in a short time, and we made good speed down the trail, reaching our boarding place at dusk.

The ladies of the party all expressed surprise at the absence of the great fatigue we had expected to experience. Two of us joined a large circle of ladies and gentlemen around a big bonfire that evening, where we enjoyed some enthusiastic singing.

That the two who were "used up" were both gentlemen was a fact which was a cause of secret gratification to one of the company, who is a rather open admirer of her own sex.

The most delightful of times will come to an end and the common fate followed our devoted company of four, and with many longing, backward looks we took our way to the plains, vowing to return next Summer. So may it be! F. J. WHITAKER.

HOW I PREVENTED THE STRIKE.

M. W. W.

THE largest part of the Winship Mills is owned by my husband's brother in company with a cousin of ours, but Carl is considered one of the firm; he has been a stock-holder since our marriage, three years ago. Though having less to do with them, he is quite a favorite with "the hands," while cousin John continually gets their ill-will. John is a just man, not generous; there are many such in business and elsewhere.

The mills are up the river, about four miles from the city where we all have our homes. Hendric and his family live in an elegant way in a large beautiful new house; John keeps bachelor's hall, is not a social man. Aunt Mary has managed his home to his satisfaction many years. Carl and I live on the old homestead, inhabitated by the Winships several generations back.

Available water-power along the river was utilized by Carl's father and several mills sprung up in his time which have been enlarged and new ones built by "the boys," who have succeeded in their manufacturies well and honorably. It has ever been a rule to pay fair prices for trustworthy workmen, and such have been secured, though largely foreigners, most of them Irish—a stubborn, ignorant class of people as found in manufacturing villages.

Some rebellious ones had been stirring up strife, and had asked for increase of wages, which Cousin John refused with little patience, giving no explanation of the low state of business and the impossibility to increase pay now.

This petition was made about a week before New Years. Hendric and his family were off for the holidays, not to return for several days, when James, our man-of-all-work, a staunch Catholic, who had been in the family many years, generally respected for promptness and faithfulness, appeared at the library door in a great state of perturbation, hat in hand—a sorry looking Irishman, in truth;

"Well, James, what is it? No serious trouble has come to you, I hope? Anything about Mr. Winship, James?" My husband was off taking orders and would not return till Saturday: this was Wednesday.

"Faith, marm, 'tis no good I am telling ye'es, but 'tis not of Misther Winship. Me boys been hearin' it in school, and one of the min himself has but jest notified me o' the same, or I should niver be here a tellin' ye. A number of 'em axked a lift to their wages and since has hinfluenced all to quit work on Saturday, and I be's free to spoke it. Some be that sorry Misther Carl is in it: they's can hardly do it." James delivered himself of this speech with more or less difficulty, gesticulating with head and hands; yet giving up the intelligence seemed to relieve him, for by the time he finished, his scared, red face had lost its look of trouble entirely.

"Are you sure, James, there is a settled determination to stop work on Saturday?"

"Sartin sure, as I am standing on my two feet." Very substantial feet they were too.

"Can you promise me, James, you will let no one know I am told of this?"

"By the Virgin and all Saints, I promise to keep quiet."

After our "Friday" had left, I was in great perplexity. I knew wages could not be increased one cent and have the business pay at all. For all the hundred families to leave and as many new ones to be installed, would be a tremendous loss, too. Cousin John had said "No," and he would never "go back on his word to these people." Before Carl's return, the men would have idled about a day, the mills would have been still as long. I revolved it over in mind all Wednesday night, and Thursday morning ordered the carriage ready at an early hour. I took James into my confidence, for I must tell my plan to assure myself it was a good one. He was full of praises, but I felt doubtful in the extreme.

Fortunately the janitor could work for me and in the afternoon of Thursday I commissioned James to drive to the village, up the river, and leave in every house and all conspicuous places this notice:

"Every woman is urged to go to the hall immediately after supper. Mrs. Carl Winship wishes to see you. Come right as you are, dressed for work, and bring the children if you like. Do not fail to come, one and all."

Not having addressed the public ear since school-girl days, I should have dreaded the ordeal under ordinary circumstances, but this audience and the occasion now was exceedingly peculiar. Imagine an audience of ignorant women, some of them very untidy, dirty looking, unable to speak English with any degree of accuracy, a lot of children clinging to them, others somewhat older racing about the room, while a few men were straggling about the doors. I entered and commenced talking at once, to draw attention and to waste no time in this place. This is the substance of my speech:

"My good women, I think it is my privilege to know every one of you, and before I leave this room let me shake hands with all. To-morrow will be New Year's Day and I have been thinking it is probably true that you do not feel able to get up a fine dinner to-morrow, so soon after Christmas, your great holiday, and I have ordered a man to bring some chickens here. James, will you help bring them in now? I want to give each family a nice chicken. I wish it was a turkey, but I can not afford that, for our business is not paying much over expenses, which are heavy. You know, my good women, we get very small prices for the nice flannel you work on, only 75 cents a yard, and just think of all the cost of it! The machinery to be kept in repair, and the price of wool and then all the help. What we pay to our men and women is so much that the profits are exceedingly small, as Mr. Carl could tell you far better than I can. But here are the chickens. Now each one of you who has a family come up and leave me your name and James will give you a chicken, and if you know of any woman who is not here, she can send her husband to our place to-morrow morning, no matter how early, and I will take the name and give him the chicken. Now I'll take your names in order to remember you. I expect this year, coming in to-morrow, to call upon all the families in this village, and if I can help you or your children in any little ways I intend to do it, and you must call upon me for this. To-morrow will be a nice time for you to make calls upon each other. You know New Year's Day is the day, for receiving calls, by the ladies, who live in the cities, and why not do so here? Now, if you all have a chicken, I expect you are in a hurry to be off to your homes and I will not keep you. Good-by, good-night, "a Happy New Year."

Well! the men all worked on Saturday. After the manner of old Latin fables, *Hæc fabula docet*, "the wife is a power in the home," checking rash purposes, also employers wives do not know their privilege in the families of the employed till they have some experimental knowledge similar to this of mine.

CRITICISM.

THE best critics are those who praise more than they censure. If this be true of literature, it is equally true of business and social life. Many employers lose faithful service because they never praise when everything is well done, but always censure when anything goes wrong. No sensible person objects to a merited rebuke, but they often long for a word of commendation. I once heard a little girl say: "Mother never seems to see when I do the kitchen work extra nice, but she always scolds if I leave anything undone."

How many employers, mothers and teachers work upon this principle, unconscious of the fact that they might use pearls as well as sharp arrows and the result would be servants, children and pupils equally as well trained, while a bond of esteem or love would be molding a close connection which might be very serviceable some time.

When a new-comer into a neighborhood persistently finds fault with the customs of society she is shutting the door of future usefulness and friendship. If we do see foibles in the manners of the place, why needlessly dwell upon them? There is surely something to commend. Then allude to it pleasantly and if there is any custom very uncongenial overcome it by example; such as Sabbath visiting, "big" surprises, etc. One can commend the sociability of the people and by often inviting a half a dozen friends—congenial people—to dinner or tea during the week, they will soon observe the greater pleasure to be derived from smaller parties, especially if they enjoy a wide range of conversation. By never inviting neighbors in on Sunday and never returning calls on that day the custom of your household will soon become known and it will be received far more pleasantly than if you had leveled a volley of fault-finding against *their* way.

Better to over-estimate the good at times than form the habit of dwelling always on the bad qualities of people, churches and communities. "Charity thinketh no evil."

EMMA C. STOUT.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

MRS. HIGHTON'S DIARY.

ANNIE L. JACK.

My friend, Mrs. Highton, has been home for a short visit. She lives now in one of the fashionable city streets, and her face has grown pale and thin since she left her father's house, our nearest neighbor. She was a dear little girl as Dolly Dawson, and thought quite perfect by her father and mother, when young Mr. Highton came from the city and won her away. An only daughter too. I remember poor Mrs. Dawson coming to me the morning she left and she said—"I feel like the ancient arrow maker," and I mentally went over the lines I knew had touched her heart:

"Thus it is our daughters leave us,
Those we love, and those who love us,
Just as they have learned to help us.
When we are old and lean upon them,
Comes a youth with flaunting feathers,
With his flute of reeds—a stranger,
Wanders piping through the village,
Beckons to the fairest maiden;
And she follows where he leads her,
Leaving all things for the stranger."

"Yes it is hard," I said, "but if she loves him, and he is the right man, all will be well." It is a piece of sophistry, I fear, for love alone does not make rough paths smooth for tender feet, and Dolly Dawson, at the end of two years, when she returned to her old home, would never be known for our fair village maiden, light-hearted and happy.

Before she returned to the city I had a long talk with her on household experiences, and she placed in my hands her diary of one year, to use as I saw fit. "For I think," she said, "there may be some useful experiences in it to guide others." "Happy? Yes, I am; but I would give a great deal for my free and health-giving country life." And this is how it happened that I have obtained this thin manuscript book in which are some new recipes and some practical hints, that may be read with interest by readers of our columns during the coming year. Some things I must leave out, but I confess I am quite pleased with the result of our young untried girl's experience, amid all her failures.

"Jan. 1st.

"Edgar has gone out to make calls. I do wish he could take me with him. But it is my duty to stay at home and 'receive.' I do not like the custom while he is away, and am homesick for my dear old shabby home. There all was so comfortable and cheerful, and not so much was said about duty. It seems to be one of Edgar's favorite words, and he uses it and 'promptly'

Free of charge. A full size cake of Ivory Soap will be sent to any one who can not get it of their grocer, if six two-cent stamps, to pay postage, are sent to Procter & Gamble, Cincinnati. Please mention this paper.

on all occasions. City people, many of them, seem so formal—their 'Happy new year' has no warmth to it, they come and go in a hurry as if it was part of their daily business. One thing they did was to praise my cake, and I think sincerely, and one gentleman said it was so seldom they had home-made cake that he must take a second slice. I am glad mother taught me to make good cake, for Edgar's taste is so fastidious, and it is no use trying to get a servant to do fancy cooking; it is far better for the mistress to do it herself, then she has no one to find fault with, and it saves a world of trouble."

CAREFULNESS.

ZENA CLAYBOURNE.

A LITTLE episode at home to-day suggests the importance of being too careful rather than a little careless in regard to what we take for food or medicine. We three girls were alone, and indulging ourselves in a lunch, which saved getting up a dinner. Alice has a depraved appetite for cold potatoes cut up in bits with butter, salt, pepper and vinegar. She said "Girls, what ails that vinegar?" Now we have been quite proud of our beautiful dark, wine-colored vinegar, and this was light-yellowish with a red sediment in the bottom of the bottle. Dorcas pleaded guilty to having put in some molasses very much diluted; but we hardly thought that could produce such effect. Alice had her potatoes carefully prepared. She took the vinegar bottle and poured out the usual quantity. Wherever the fluid touched the potatoes, they turned as green as grass. She half screamed "Just look at those potatoes!" Still we wondered and watched her while she poured a little into a teaspoon and tasted. But that ended our lunch. She started up aghast, holding her mouth and exclaiming "Get something—some water, egg, mustard—anything." What a scene! Dorcas snatched the water pail, which was empty, of course, and I flew down cellar for an egg, which she swallowed raw, and then brought warm water from the teakettle. She drank a quart, and in answer to my eager question "What is it?" said "Washing fluid." I seized the Handy Book and read, potash, muriate of ammonia, salts of Tartar, and sent Dorcas, who came flying in with a pail of water, for Dr. Hall's Journal of Health. The only thing we could find appropriate under poisons was muriatic acid, for which warm, sweet milk was recommended—also chalk. Dorcas brought chalk from the barn and pulverized it, while I spilled half a new package of cinnamon looking for mustard, and Alice kept drinking warm, sweet milk and making wry faces.

However, after vomiting a little, she felt better, we became more calm, and she explained how she had asked John to hand out to her the white jug, because it was heavy, and then being called away, had left him to fill the bottle, and he must have taken the wrong jug.

Alice had a pretty sore mouth and throat, but we have thankful hearts, and shall never forget the lesson.

HOUSEKEEPER'S MUTUAL HELP CLUB.

GLADDYS WAYNE.

"A SOFT answer turneth away wrath, but grevious words stir up anger," repeated a dear little four-year-old, in charming babyish fashion, at our Sunday lessons. This is but one of many instances where forbearance and kindliness and charity are portrayed in all their divine beauty, as enjoined upon us. Oh, let us engrave these gems of spiritual truth on our hearts and so assimulate them with our thoughts and affections that our whole lives may be imbued with the spirit of a love divine.

As members of one great sisterhood, whose common joys and sorrows should bind us together in tenderest sympathy; we should entertain for one another naught but kindly sentiments. Differing as we do in mind and person, it cannot be expected that all should think or see alike; but we may avoid all unkind or ungenerous expressions of our various opinions, and in forbearance, in kindness and love seek to benefit each other.

It pains us to see any "root of bitterness springing up" to mar our department of the paper. Dear "Justice" and "A. C. C.," let us all clasp hands in a circle where the electric thrill of sympathy, "peace and good will" shall have unbroken sway.

Let us remember that "circumstances alter cases." And circumstances are often beyond our control. A rule that holds good for one, or in one place, often proves impracticable for others in different sections. Even with us in the East, country market prices greatly vary at different places, and what is easily attainable in one town may be exceedingly difficult to obtain in adjoining towns or in different parts of the same town. And we, East or West, to whom meat or other markets are inaccessible or beyond our means, must contrive to dispense with such articles in the degree that seems necessary. If eggs and butter fail to bring good prices and butcher's supplies are high, only those not affected by such circumstances feel justified in a constant patronage of the butcher. We who are making our way must make "one hand wash the other" in our household arrangement. We think it good economy to make use of the eggs, milk, cream and butter in the family rather than sell at losing prices to meet a regular butcher bill. If there is a surplus, of course one must take the going price, wherever sold.

In our own family, we do not use much pork, especially in Summer, and at that season fresh meat is seldom seen; but the "speckled beauties" of our mountain streams, and the delicious sweet cream and milk furnished by our one cow, make up in no small degree for the absence of butchers and their supplies. Eggs are never plentiful with us, so I have learned to bake with but few, thinking it better to save most of them to eat; and like "Anou" in regard to apples, when I find a cake, pie or pudding recipe that calls for five, six or a dozen eggs, I seldom finish reading, but look for something adapted to my means. As "Justice" very justly says, all methods of cooking are not alike adapted to all sections. Perhaps in future "Helps" we may be able to benefit the Western as well as Eastern sisters.

A WEEK'S WORK AT MRS. HOMESPUN'S.

MONDAY.

AT seven o'clock, breakfast being over, the active housekeeper introduced the wash-bench into the kitchen and began work at the weekly washing. The clothes basket was first overhauled, and everything sorted to be at hand when its turn came; the white clothes were put soaking in one tub, while the flannels and calicoes were rubbed out in another. As fast as a colored garment was finished, it was plunged into a pail of cold water and the stockings and knit underwear were scalded and wrung out as soon as they were cool enough to be put through the wringer without damage to it. They were immediately hung out by the ready assistant (the grown-up young lady of the house), for it was one of the kitchen rules that no one actively engaged at the wash-tub should go out-of-doors to hang up any of the clean clothes.

Such was the power of head and hand work, with the help of a passable washing machine, that by ten o'clock everything was swinging on the line: the tubs had been returned to the cellar that they might not get too dry, the floor wiped up, and Mrs. Homespun in a clean apron was leaning back in a cushioned rocker, feeling if tired, quite contented, for her work had been accomplished to her satisfaction. In the meantime the young housekeeper had not been idle; she had washed the milk pails and pans; the breakfast dishes and made the beds; filled the lamps and lanterns needed for use at milking time, and with soft paper polished the lamp chimneys, and had set them all in a shining row on the shelf, in their accustomed place. Potatoes had been prepared for dinner, and cabbage chopped for cold-slaw, as no extras in the shape of pies or puddings were prepared on Monday on account of the burden of the forenoon's work, and the tidy dinner table as the family gathered around it seemed to lack nothing.

After dinner, while the young housekeeper washed the dishes, Mrs. H. made a cream cake to bake for supper, putting in the oven at the same time a tin full of sweet apples. "It always seems shiftless," she remarked as she closed the oven door, "to be baking in the afternoon, any day but Monday. I do all such work in the fore part of the day, and let the stove rest in the afternoon."

Then she brought out a basket of carpet rags and began work sewing them, while she watched the fire and her cake. The young lady brought out a paste-board box of cuttings from the newspapers, short pieces of poetry and prose; and spreading out her materials on the table, began to work at a scrap-book, which she was making for a Christmas present to some of her friends.

Quiet reigned, until the clock striking four, Mrs. Homespun, putting in the basket a large ball of carpet rags she had just finished winding, rose to prepare supper for the hungry school boys, whose coming might be expected in the course of an hour, while the daughter repaired to the clothes line to see the condition of things there. An hour and a half more saw all the kitchen work finished and the family in the cosy sitting-room, some reading the weekly papers, the school boys preparing lessons for the next day, and Mrs. H. darning mittens for them.

IRENE.

NOTE. ERIN was the writers name of the article "Some nice quilts" which appeared in last week's RURAL, page 11. E. M.

Debility

Languor, and Loss of Appetite, are cured by the use of Ayer's Sarsaparilla. It removes that terrible sense of *Constant Weariness*, from which so many suffer, gives tone and vigor to the stomach, and restores health and strength more surely and speedily than any other medicine.

Three years ago I suffered from Debility and Loss of Appetite, the result of Liver Disease. After having tried various remedies, and consulted several physicians, without benefit, I was induced to take Ayer's Sarsaparilla. The first bottle produced a marked change, and the second and third accomplished so much that I felt like a new man. I have, since that time, taken about one bottle every year, and had no recurrence of the trouble.—William E. Way, East Lempster, N. H.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

JACKSON ARCHITECTURAL IRON WORKS.

Iron Work of all kinds for Buildings.

Office 313 EAST 28TH STREET, NEW YORK.

STABLE FITTINGS A SPECIALTY.

DEAFNESS its Causes and Cure, by one who was deaf 25 years. Treated by most of the noted specialists of the day with no benefit. *Cured himself* in three months, and since then hundreds of others by same process. A plain, simple and successful home treatment. Address T. S. PAGE, 125 East 26th St., New York City.

News of the Week.

HOME NEWS.

SATURDAY, Jan. 2, 1886.

As the revenue receipts have been light during the month and the pension payments heavy, the public debt has increased about $2,000,000 . ... The total length of main lines of railroads, not including second tracks, sidings or renewals, laid in the United States during 1885, has been 3,113 miles—about 700 miles less than in 1884, and less than in any year since 1878. The new track laid this year is distributed as follows: New England, four lines, 13.5 miles; Eastern and Middle States, 26 lines, 281.9 miles; Middle and Western States, 32 lines, 464 miles; Southern States, 44 lines, 727.4 miles; Missouri belt, 21 lines, 542.5 miles; Kansas belt, 24 lines, 828.6 miles; Colorado belt, two lines, 14 miles; Pacific belt, 14 lines, 240.9 miles. Total in 34 of the 47 States and Territories, 166 lines, 3,112.8 miles.....The Newark dog-bitten children have been successfully treated by Pasteur and are to start for home to-morrow. Pasteur says that carbolic acid is much better than hot iron for cauterizing dog bites. ...Over 9,000 Chinamen are now employed by the 241 cigar-makers of San Francisco; but the anti-Chinese agitation has induced five of the chief employers to agree to employ Union workmen, and 200 men left Boston Monday to take the places of the Celestials. When they got to Chicago, however, it turned out that the agent who engaged them had disappeared, and they were left "stranded." It is expected that white men will soon fill all the manufacturies .. . Owing to the falling off on exports of agricultural products, to pay for goods we have bought in Europe, gold had to be exported last week, the first time within 10 years. At the same time last year the excess of exports was over $49,000,000.....There has been a world of disorder and fighting among Polish Catholics at Detroit, because an objectionable change of priests was made by the Bishop ..... Great distress has been caused by the stoppage of several collieries in Pennsylvania, because the companies have combined to limit the output, so as to raise or keep up prices. The men have been working on "starvation wages" so that they could lay nothing aside, and rioting is expected ..... At other collieries the men are out on a strike for "living wages," and much bitterness exists against the "scabs" who take their places, many of whom have been severely beaten, and all of whom are guarded by police or private detectives. The Knights of Labor are sending supplies to the famishing people. Much wretchedness and desperation in nearly all the Pennsylvania coal mining regions .....The State Auditor and Attorney General of Illinois are investigating several co-operative insurance companies. They appear to have no means of keeping their promises to pay certain sums upon the death of members. The number of such societies has increased enormously of late, and there is no doubt a vast amount of swindling in the management of many of them ....We are very sorry to learn that the mammoth seed house of D. M. Ferry & Co., of Detroit, Mich., was burned yesterday morning. The flames started in the packing department at 9 A. M., and by 10 the Ferry Block was all in flames. The Ferry building was erected six years ago, and occupied half of the square, being one of the largest in the city. In the burnt building 400 people were usually employed, besides 400 more on the firm's mammoth farm outside the city. Had the fire not occurred on a holiday, the loss of life must have been heavy. D. M. Ferry's stock alone is estimated to have been worth from $1,000,000 to $1,200,000, and the building was worth $250,000—total insurance, $460,000. The loss on the other burnt buildings will foot up the aggregate to at least $1,500,000. All are at a loss to account for the fire, though incendiarism is suspected, as there were no fires in that part of the building where the flames were first seen..... Three deaths from trichinosis during the week, two in this city, where thirty-two people have been more or less severely affected by it from eating badly cooked pork at a family reunion, and one near Cleveland Ohio, where a family of four are affected from eating chips of raw ham. Several other cases are reported here and there; but we have noticed no more deaths . ... There is a movement to give each of the nine Justices of the Supreme Court of the United States a Private Secretary at Government expense. Each Secretary would have to be a stenographer, and would probably command $2,000 per annum ..... The Georgia Prohibitionists are scoring victory every time. First they passed a local prohibition law in the legislature. Then they carried Atlanta and Fulton County by over 200 majority, after having carried three-fourths of all the counties in the State. The liquor men then tried to stop the official count before the United States Court, and failed. Then they tried it before the State Court, and failed again. The count has now been completed and the result has been declared, while the liquor men are beginning to fight in another shape . . In North Carolina the Prohibitionists are organizing for political action, and they are contemplating the same move in Georgia. ... ...U. S. Consul-General Mueller reports that Germany dreads American hogs, wheat and imports generally, but still more the importation of American ideas, and thus explains the present feeling in Germany against our country Of the $275,000,000 of deposits in the Massachusetts savings banks, over $252,000,000 are in sums less than $300 each. .... The Connecticut legislature has appropriated $5,000 for a statue to the memory of Nathan Hale. ..... Orange riots have again broken out in Conception Bay, Newfoundland. At Harbor Grace an Orange mob began the rioting, and more trouble is expected .....At a meeting of ex-soldiers at Terre Haute, Ind., last Wednesday, resolutions were adopted demanding the passage of laws granting pensions at the rate of $8 per month to all surviving soldiers, sailors and marines who served 60 days or more in the war of the rebellion. A bill will be brought into Congress to this effect .. ... At Salt Lake City Judge Zane has condemned Brigham Young Hampton to a year's imprisonment for conspiring with disreputable women to entrap prominent Gentiles. The Mormons are finding the laws pretty hard against them generally.. A new comet has been discovered by Professor Brooks of Phelps N. Y., ... A mass-meeting of all trades is to be held in Philadelphia next month to agitate for a new eight-hour law..... It is confidently said that many more people have been killed by Indians in Arizona and New Mexico than have been reported. A bill has been introduced into Congress providing for the enrollment of a regiment of frontiersmen especially to put an end to Apache outrages in both these Territories, as the persistent pursuit by the regular troops has hitherto been unsuccessful..... The N. O. Exposition Company has sued two directors of the Great Eastern Steamship for obtaining $10,000 by falsely representing that she was ready for sea. She was to be an attraction and a hotel at the Exposition last Winter, it will be remembered.....The managers of the New Orleans exhibition deny that there is a financial crisis going on there. The receipts are not what were anticipated, the travel from the North being small, but the exhibition is in no danger of bankruptcy..... Chicago is first in the field as a bidder for the international exhibition in 1892, upon the 400th anniversary of the discovery of America. A bill pledging government support has already been drawn, and the advocates of the scheme base their claim to this premeditated honor upon the ground that Chicago is the "typical American city." .....Col. Platt B. Walker, editor of the North-western Lumberman, says that of necessity there must be a shortage of from 15 to 20 per cent in the log-cut of his section this Winter, owing to the warm weather, many of the men, owing to the absence of snow, are going away in disgust.... . The written opinion of Judge Powers, of Utah, who recently refused to naturalize a Mormon on the ground that he was not fit for citizenship, adds another gun to the battery playing upon the stronghold of Saints .....The Fitz John Porter bill will be put through the House as soon as possible after the holidays . .. ..The bills contracted by the United States Fish commission will be paid without challenge. The First Auditor stopped the accounts for examination, but after a careful overhauling the First Comptroller of the Treasury has approved Prof. Baird's accounts without "alteration or modification."..... By the latest estimate made by a man who is vouched for by the N. Y. Graphic, the late Vanderbilt's wealth is put at $305,000,000. A count of the securities in the vault of the Lincoln bank of this city, will it is said, prove this point. .....The Boston chamber of commerce has unanimously adopted an expression of opinion favoring reciprocity with Canada. It asks to have this matter considered with the President's recommendation regarding a commission to consider the fisheries question. . ...The Western Union Telegraph Company is reported to be anxious to have the Government purchase its plant for postal telegraph purposes, as comprehended by Senator Cullom's Bill. It is stated that should the Government buy up the telegraph company's property for the purpose named, the latter could build new lines with improved appliances at much less cost, and become a successful competitor with the former.

Coughs.—BROWN'S BRONCHIAL TROCHES are used with advantage to alleviate Coughs, Sore Throat, and Bronchial Affections. *Sold only in boxes.—Adv.*

AGRICULTURAL NEWS.

SATURDAY, Jan. 2, 1886.

DAVID MILES, a large stock breeder, of Milford, Mass., was gored to death by a pet Holstein bull in his barn, Dec. 17 The Sixth National Agricultural Convention, under the auspices of the American Agricultural Association, will be held in New York Feb. 3—5. .

The following are the officers of the new Fertilizer and Chemical Exchange of this city:—C. V. Mapes, President; John Kehoe, William H. Bowker and William H. Reed, Vice-Presidents; George B. Forrester, Treasurer, and John T. Williams, H. J. Braker, R. G. Kirkland and A. S. Malconson, Directors .. .. Holland sent us during the past year $250,000 worth of flowering bulbs .... Glanders in an unusually fatal form is attacking horses in Elmira, N. Y. The annual meeting of the New Jersey Horticultural Society was concluded Wednesday afternoon, when the following officers were elected: President, A. W. Pierson, of Vineland; recording secretary, E. Williams, of Montclair; corresponding secretary, T. C. Lovett, of Little Silver; and treasurer, C. L. Jones, of Newark ... ... The milk producers of Orange County, New York, have been again discussing the feasibility of establishing a Farmers' Milk Exchange in this city, so as to be independent of the milk dealers. Such associations have for some time been operating successfully at Boston and Springfield, Mass. ... The Association of Missouri Wool Growers propose to hold a grand National Sheep shearing at St. Louis, Mo., on April 7th and 8th, 1886. The St. Louis Cotton Exchange guarantees $1,500 in cash premiums. This should be an interesting occasion to all who are within its reach . The report of the Registrar shows that the value of the crops in Ireland this year increased $8,471,115 as compared with 1884, and that it was $1,419,820 above the average for the preceding 10 years..

A syndicate of Eastern capitalists are preparing to turn the water-power at Harper's Ferry, W. Va., to account, and expect to turn the place into a second Pittsburg .. Small pox has disappeared as an epidemic in Montreal and the U. S. quarantine has been raised. Besides the loss of millions of trade, owing to people keeping away from the place through dread of contagion, the epidemic cost the city $118,000 in actual outlay, and another large sum will be needed to meet the remaining engagements entered into .... During last year, bees in Ohio gathered 1,731,095 pounds of honey, estimated to be worth $276,975, while fowls produced 33,602,321 dozen of eggs, valued at $4,890,348. The value of the eggs was nearly equal to that of the wool produced in the State . The greatest "cabbage patch" in the country is said to be one in the vicinity of Chicago, which contains 190 acres, all devoted to the cabbage culture, producing in favorable years 1,100 000 heads ..... Last year there were grown in Kansas 116,511 acres of sorghum .. ... The grocers of New York are said to make profits aggregating about $4,212,000 a year on bogus butter . ... Potatoes are advancing steadily in the East, and bid fair to be pretty high before the next crop is marketed..... ....The average home price of wheat in all parts of the country for the last five years has been 95c. For the ten years previous the home price was $1.05. The present average is 78c. .. .. Stocks of grain in store in New York on December 26; Wheat, 9,518,325 bushels; corn, 1,089,127 bushels; oats, 1,223, 454 bushels; barley, 188,282 bushels; rye, 144,471 bushels ..... . .The wool imported last year was in volume about 17 per cent. as compared with the home production. In 1880 it was 20 per cent.; in 1881, 18 per cent.; in 1882, 14 2 per cent.; in 1883, 20.6 per cent..... ... An experiment was lately made at the Michigan Agricultural College Farm to see how much hay equal lots of Merino and Southdown sheep would eat up clean. The result showed about an equal consumption, although the South Downs averaged nearly 50 pounds heavier than the other sheep.....

Holland takes the lead in the manufacture of butterine. There are now about 45 manufactories in that country, the majority of which are in North Brabant, where the farms are small, and can only maintain one or two cows. Consequently, as these farmers can only make a small quantity of butter, apt to spoil before it can be collected or sent to market, they are the more willing to make contracts with the manufactures of butterine. The consumption is chiefly in England. Export in 1883 amounted to 40,000 tons, valued at 4,350,000 florins ..... .The next London wool sales will open on Tuesday, January 19, with about 230,000 bales on sale ..... In 1812 wool sold for $2.50 per pound .....There is an unmistakable and general feeling all along the line in foreign markets to advance the price of wool.

CABBAGE SEEDS.—In answer to several inquiries, Tillinghast's Puget Sound Cabbage Seeds seem to have a very high reputation wherever they have been used. Persons desiring home testimony in any State in the Union, will be referred to disinterested growers who have tested them, by dropping a postal to Isaac F. Tillinghast, La Plume, Pa.—*Adv.*

Crops & Markets.

SATURDAY, Jan. 2, 1886.

Our Consul-General at London reports that the depression in wheat cultivation in Great Britain has never been greater, the area under the crop this year being 7½ per cent. less than last year. The farmers of Yorkshire have recently formed a co-operative society to buy goods at the lowest figures wholesale, and to sell their produce directly to customers without the aid of middlemen. Agriculture in Scotland, too, is in a bad condition, many farms being deserted and degenerating into a wild state, like the abandoned farms on the hills of New England. This state of things is said to be all due to foreign competition. The Consul advises American farmers to grow more oats and barley for export, because on these there will be no competition from India and little from other places.

The Mark Lane express of last Monday says that in spite of the cold, damp foggy weather the growing British grain crops were healthy, and says a curious feature of the market is the ability of holders of English wheat to undersell foreign wheat. Quotations are 30s 2d per quarter—against 31s 5d last year. American grains are 1½c a bushel lower. The relative importance of the United States in supplying the United Kingdom with wheat at the present time may be inferred from the following record of receipts of breadstuffs at London for the week ending Christmas day. They comprised 221,680 bushels of wheat from India, 150,584 bushels from Russia (Black Sea ports), 47,816 bushels from Germany, 17,120 bushels from New Zealand, 7,992 bushels from United States Atlantic ports, and eight bushels from Arabia, altogether 454,200 bushels. The new national representatives in France are reported to favor still higher import duties on foreign grain, "as prices during the last six months have remained exceedingly low."

Prices of wheat everywhere have been higher during the week, owing first to rumors that Russia and Austria were vigorously preparing for war in the Spring over the Balkan troubles. Then came the report of the decline in the visible supply in the United States and Canada, east of the Rockies. The New York Produce Exchange puts this at 330,140 bushels, the Chicago Board of Trade says it is only 67,495 bushels. Later a decline occurred, owing to London cables telling of heavy stocks, dullness in trade and folly of shipping at higher figures than 85 cents per bushel in New York. Here exports are nominal. At San Francisco they have been, since July 1, only 5,85,000 bushels against 12,447,000 bushels in the latter half of 1884.

A telegram from Washington, on Thursday, says: "The estimates of the Department of Agriculture for the principal cereals are in round millions as follows: Corn, 1,936,000,000; wheat, 357,000,000; oats, 629,000,000. The area of corn is 73,000,000 acres; of wheat, 34,000,000; of oats, 23,000,000. The value of corn averages nearly 33 cents per bushel, and makes an aggregate of $635,000,000, $5,000,000 less than the value of the last crop. The decrease in the product of wheat is 30 per cent., and only 16 per cent in valuation, which is $275,000,000. The valuation of oats is $180,000,000. The reduction in wheat is mostly in the valleys of the Ohio and in California. The production of all cereals is 53 bushels to each inhabitant, and the aggregate volume is larger than in any former year.

Amount of grain in sight in the United States and Canada on Saturday, December 26, and the amount of increase or decrease from the preceding week: Wheat, 58,320,974 bushels, decrease 67,595 bushel; corn, 7,084,880 increase 1,819,237 bushels; oats, 2,580,818 bushels, increase 140,754 bushels; rye, 807,028 bushels, increase, 57,871 bushels; barley, 2,243,176 bushels, increase, 45,792 bushels. The amount in store in Chicago elevators at same time was: Wheat, 14,459,855 bushels; corn, 1,921,998 bushels; oats, 252,453 bushels; rye, 200,377 bushels; barley, 223,220 bushels.

Wheat holds its own bravely in the North-

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

west, having advanced to 90¾ cents for No. 1 Hard. The talk, too, is bullish. The stock at Minneapolis and St. Paul decreased 100,000 bushels; that at Duluth increased over 200,000 bushels. Stock on hand in the bill places 12,680,000 bushels. Deliveries of wheat in country districts light owing chiefly, as in all the West, to bad roads due to rain and melted snow. A good deal of wheat is held for better prices.

There is a reported increase in the visible supply of corn; but the exports have been unusually heavy; due, it is said, to shippers having contracted for room and being compelled to make purchases to fill their contracts. Prices have become stiffer. Deliveries have been fairly free; and the quality of the grain has been quite good. Oats, too, have been fairly firm in spite of an increase of 81,304 bushels in the visible supply according to Chicago, or of 140,754 bushels according to New York.

In the winter wheat belt, no "snow" on the ground and little frost has been the rule the past week. Farmers were harrowing wheat land in Dakota, and plowing corn land in Kansas. The wheat is subject to slight freezings and thawings. Last Wednesday the report of an approaching "cold wave" from the Far Northwest sent up prices of wheat, as a severe frost would be very disastrous to next year's crop in the present bare condition of the ground.

The demand for fancy creamery butter has not been as active as it was last week. For selected Elgin (Ill.) creamery, former prices were obtained; but the market was easy on all other grades. No improvement in the outlook for cheese. Small export demand for either.

Cattle, particularly fat beeves, are lower now than for several years, owing, first, to the increase of cattle raising not only on the ranges, but also on Eastern and Western farms; and, second, to the extraordinary abundance and cheapness of mutton.

Holders of wool are confident of better figures. Until recently, the greater demand for low or medium grades caused fine sorts to be neglected; but now prices of these are going up, as there is a growing belief that there will not be "enough to go round." On the whole, the past has been a fair year for the wool trade. During the first six months, prices were low, but for the last six months, they have been steadily rising, especially for low, low medium and medium kinds.

Thirteen to fifteen mills are in operation at Minneapolis and the output ranges from 13,000 to 18,000 barrels a day. Except in case of the very largest, the mills take turns running, the same set not continuing two weeks at a time. Millers are confident there will be an improvmedt in the flour markets soon.

The Cincinnati Price Current of Thursday says the total number of hogs packed in the West last week was 255,000, compared with 390,000 for the corresponding week last year. The total from November [opening of the winter packing season] to date was 4,030,000 hogs, against 3,065,000 last year. The movement at the prineipal points since November 1 is thus summarized:

Chicago	1,630,000	Indianapolis	195,000
Kansas City	400,000	Louisville	115,000
Cincinnati	250,000	Cedar Rapids	115,000
St. Louis	235,000	Cleveland	42,000
Milwaukee	217,000	St. Joseph, Mo.	79,000

A cablegram on Thursday gives the prices of American apples at Liverpool as follows: Greenings, $2.21 to $2.70; Spitz, $2.70 to $3.19; Baldwins, $2.70 to $3.37; Newtown Pippins, $2.95 to $6.04; Golden Russets, $2.95 to $3.90.

According to the American Grocer there has been a heavy decrease in the tomato pack of 1885, as compared with that of 1884, the total pack this year being 1,434,006 cases of two dozen tins each, against 2,021,177 cases in 1884, and 2,943,579 cases in 1883.

	Cases, two dozen tins each. 1885.	1884.
Maryland, Virginia and Pennsylvania	408,212	507,021
New Jersey	352,650	839,582
New York	102,700	75,400
Iowa	85,325	80,175
California	69,117	174,800
Indiana	68,400	91,000
Delaware	63,117	77,000
Missouri	64,500	65,000
Ohio	63,000	75,500
Kansas and Nebraska	33,120	89,450
Canada	30,106	112,000
Michigan	26,800	38,000
Massachusetts	24,264	59,500
Connecticut	12,933	8,300
Illinois	9,762	37,600
Totals	1,434,006	2,021,177

The decrease is attributed to the fact that through the cost of packing has been cheaper, it has been at the expense of quality; and the competition for other canned vegetables has been greater. Stocks on hands are light and prices are likely to advance.

The Tobacco Association of Lynchburg, Va., has issued a circular announcing sales during the month of December of 5,461,260 pounds of tobacco, the largest sales for the same month for years.

The following figures are furnished by a large tobacco export firm of this city: "The total visible supply of American tobacco in this country and Europe on January 1, 1886, was 158,945 hogsheads, as compared with 111,646 hogsheads at the same date last year. The stock in New York on January 1 was 30,405 hogsheads, as compared with 19,630 hogsheads the same date last year. The export from New York during the past year amounted to 131,316 hogsheads, as compared with 85,958 hogsheads exported in 1884. The receipts at New York this year amounted to 143,911 hogsheads, as against 108,000 hogsheads received in 1884." The trade in seed leaf tobacco has everywhere been dull during the week.

MARKETS BY TELEGRAPH.

SATURDAY, January, 2, 1885.

CHICAGO.—Compared with prices a weeks ago, regular wheat is ¾c. higher; No. 2 Spring, 1c. higher. Corn, ⅞c. lower. Oats, ⅜c. lower. Pork, 27½c. higher.

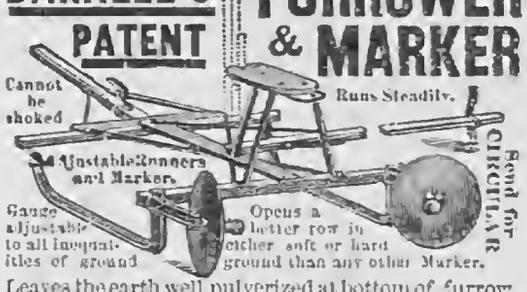
KNOW THYSELF.
A GREAT Medical WORK on MANHOOD.
Nervous and Physical Debility, Premature Decline in man. A book for every man, young, middle-aged and old. It contains 125 prescriptions for all acute and chronic diseases, each one of which is invaluable. So found by the author, whose experience for 23 years in such has probably never before fell to the lot of any physician. 300 pages, bound in beautiful French muslin, embossed covers, full gilt, guaranteed to be a finer work in every sense—mechanical, literary and professional—than any other work sold in this country for $2,50, or the money will be refunded in every instance. Price only $1 00 by mail, postpaid. Illustrated sample 6 cents. Send now. Gold medal awarded the author by the National Medical Association, to the officers of which he refers.
The Science of Life should be read by the young for instruction, and by the afflicted for relief. It will benefit all.—*London Lancet.*
There is no member of society to whom The Science of Life will not be useful, whether youth, parent, guardian, instructor or clergyman.—*Argonaut.*
Address the Peabody Medical Institute, or Dr. W. H. Parker, No. 4 Bulfinch Street, Boston, Mass., who may be consulted on all diseases requiring skill and experience. Chronic and obstinate **HEAL** diseases that have baffled the skill of all other physicians a specialty. Such **THYSELF** treated successfully without an instance of failure.
Mention this paper.

DARNELL'S PATENT FURROWER & MARKER



Leaves the earth well pulverized at bottom of furrow. Marks any width from 2½ to 5 feet, and from a mere mark to 6 inches deep.
"Take pleasure in recommending it. It does the business; is well made and will last for years. *J. S. Collins, Moorestown, N. J.*
"It far exceeds my expectations. If the real merits of this cheap implement were known to potato growers alone, the sales would be immense. *E. L. Coy, Pres. Wash. Co. (N. Y.) Agr. Society*

For the Young.

I HAVE received several bean reports during the past week. I expected to announce the names of the winners this week, but several of the Cousins are behind with their counting, so I will wait just one week more. Remember now, this is the last chance.

OF course, we all had a nice time through the holidays. I say "of course," because I know that our "good times" are always the product of our own thoughts and deeds. Did it ever occur to you that we can raise a crop of "good times" just as we can raise a crop of beans? Sometimes we get angry or naughty, and thus lose all the results of our good intentions, just as Jack Frost cut off so many of the beans. The point for us all to remember is that we make our own good times, and that every five minutes spent in anger spoils an hour of enjoyment.

UNCLE MARK saw a queer looking Santa Claus last week. His costume was made up on the spur of the moment. He had a red towel about his head, a scarf tied over his face, and a blanket over his shoulders. He came limping in, as if he was dreadfully lame. There was one little boy who was pretty well frightened when Santa Claus came up to shake hands with him. But when the old man began to take the presents, and hand them about, the little fellow felt better. He stood up and said: "I'm much obliged to you, old Santa Claus, and I'm sorry you are lame.' It may be that some of our older Cousins are a little too wise to believe in Santa Claus. I hope they will not forget him however. We want to believe in him as long as we can.

WE have had no snow thus far in New York. Uncle Mark would like to see a real old-fashioned snow storm. Very likely we shall have it yet. I have no doubt many of the cousins are "snow bound" even now. Up around the great lakes the snow is piled in great drifts, and people are glad to stay at home. Then it is that books and papers and nuts and fruit are most serviceable. A thick coating of snow is good for the ground. It helps the wheat, even if it does close up the roads and choke up the valleys. Once in a great while they have quite a heavy snow storm in warm countries. It is such an unusual thing that people drop all kinds of work to enjoy it. Grown men go out to snowball or bury one another in the snow. Many people gather the snow in bottles and preserve the water as a curiosity. In such countries the snow goes almost as fast as it comes, as the ground is very soft and muddy.

HERE we have a sad accident, and one often witnessed in the city. One man has lost his hat, and the other stands a good chance of losing his umbrella. It pays to keep one's eyes open and to mind where we are going.

I HOPE the boys are carding the cow this Winter. Some people try to tell me that t does not pay to card cattle, but I know better. I have tried it myself and know that a cow will do better and look better for a good brushing every morning. I am sure it does a cow just as much good to have her hide well rubbed, as it does a boy to have his face washed and his hair combed. On large farms, where a great many cattle are kept, it may be impossible to card them all, though I do think it would pay, but where there is but one "family cow," there is no excuse for letting her go uncarded. Here is a chance for the boys to do some work that will surely count.

NEW COUSINS.

WILLIE E. SMITH lives in Oregon. There has been no frost there yet. Willie goes three miles to school. The pets are a dog and two birds.

FRANK M. HIMFREY lives on an Iowa farm. He has nine pigs which he is raising for one-half profits. His colt weighs 1,130 pounds. He set out 75 strawberry plants, which are doing well. He means to put in an acre of potatoes this year. The Dunmore and Early Ohio are the best varieties.

MYRTLE A. THOMPSON writes from a Dakota farm of 320 acres. They have beautiful wild flowers there. Myrtle has a little brother.

CHARLIE A. FITCH has a big dog named Carlo. They have four cows, a calf and 75 c ickens. It is pretty cold where he lives, and the wind is strong.

EMMA MOHR lives in Pennsylvania. The peas were splendid, and the beans were the best they ever ate. The corn was a failure, the tomatoes did well, but the Garden Treasures did not come up.

EMILY COCKERAM lives in Wisconsin. There is plenty of snow there I expect. Emily's father and mother came from England 33 years ago, and have lived where they are now for 25 years. The wheat and rye were good, the peas splendid, but the corn was a little late. Emily and her sister had nearly 1,000 cabbages for hoeing the garden. They sold them for three to six cents per head.

CALIFORNIA FLOWERS.

DEAR UNCLE MARK: I promised to tell you of the wild flowers that grow in the Sierra Nevada mountains in our part of the State. The flower that first makes its appearance is called snowdrop (although it is not a bulbous plant), so thick in some places as to carpet the ground. Next, the buttercup, a bright yellow flower; soon after, the cream cup, a pale yellow flower. Before these flowers are gone such a lot of beauties come that I cannot describe them all. We have two varieties of Nemophila—a pale blue and a white one with a bright purple spot on the margin of each petal. The Shooting Star is common to many countries, and they grow in abundance here. Three kinds of Lupins, one pale red, the other two blue, one being very small and the other quite large. Larkspurs, blue and pink, the last growing four feet high. A scarlet pink called Indian pink. Cleome, Collinsia and Godetia grow nicely. California Poppy, with its orange-colored, cup-shaped flower, and there is another poppy growing in the shade—a brick red with a shining black spot at base of each petal, very showy. A pale yellow wallflower grows from three to five feet high. A very pretty purple flower, looks like a Cedronella, but the leaves are not fragrant; it remains in bloom over a month. There are a host of others that I know no name for. Of vines we have several—wild Morning Glories with creamy white blossoms. One called Devil's Cucumber grows almost as fast as the fabled bean stalk. It has small, white, star-shaped flowers, followed by a long, oval fruit about five inches long, covered with spines—very curious looking. When ripe the lower part of the pods burst open and the seeds, which are very hard, fall out. The pods turn from green to white and are so hard they lay on the ground for months. A tiny vine, with pale yellow flowers not larger than a pin-head, is very pretty. —Clematis I think it must be. Graveolens, with pale yellow flowers, grow in a perfect swamp along the streams. Of bulbous flowers the first is a pink flower, the blossom almost a globe, with three sepals at right angles to the stem. Peep inside the globe and it is covered with short hairs. The purple grass nut-flower, with its honeyish fragrance, comes next. A pale purple flower, which we call Wild Amaryllis, from its leaves resembling that plant, grows from one to two feet high. On the end of a stem a dozen wax-like flowers radiate in a circle. It remains in bloom a long time, fading to almost white. A similar flower, blue in color, comes later, but is not so long-lived. A pink climbing hyacinth also grows here. Soap-root, with its white flowers, and a variety of tulip, with white satin petals spotted and flecked with brown, yellow and purple.

Of large flowering shrubs, the first to bloom is Manzanita, with pink fragrant flowers. Laurel with yellow blossoms. Red-bud next, and a small tree, with yellow flowers, about two inches in diameter. I never could find any one who had any name for it. Another unnamed has flowers in clusters, each flower very small, white in color, so very sweet-scented as to make a person feel faint in a thicket of it. The sage brush, with its purple bloom, makes the whole mountain lovely. Up near the big trees, where we went in July, we found a shrub called Azalea. It bears flowers in large bunches; was a pinkish white. There also we found Columbines of various kinds. A lily, shaped like a single Tiger, only much smaller and nearly the same color, a deep red flower looking like a paint brush, and oh! such beds of ferns. There are many more things I should like to tell of, but if Uncle Mark finds a place for all our letters, I will surely have to stop. We are back in the valley home, but expect to spend part of next Summer in the mountains. Perhaps I may then find something more that will interest the cousins. Till then, good bye.

Lemore, Cal. LILLIE WILSON.

[Thank you for your letter. How beautiful the mountains must be! Write again by all means.—UNCLE MARK.]

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: Will you allow an insignificant little country cousin to join the Y. H. C.? You are such a happy band, I half believe you will. I never saw a copy of the RURAL until a few weeks ago when my brother took advantage of your liberal offer and sent for it five weeks free, thinking that he would subscribe. I think every family in our country should take the RURAL and every other good paper they possibly can the coming year, for our hogs in this country have nearly all fallen a victim to cholera, and I fear that 'twill be advisable to have our minds drawn from the dining table as much as possible. I wonder if the Cousins like fancy work. I will give directions for a nice shawl and perhaps some one may like to try it. Take a square of cashmere and button hole the edges after hemming, and work a border of split zephyr. I have one that I think beautiful and I caught the hem down with a fancy stitch, and bordered with shaded zephyr. You can make a handsome one at a trifling cost. I wish Uncle Mark and all the Cousins would come down in the Spring and eat strawberries with me, we have very fine ones and a great quantity of them. We have a flour barrel filled with very rich soil and several rows of holes bored all round in every stave, and a strawberry plant in every hole and a few planted on top. This is a very pretty and a nice way to grow them as the berries cannot touch the soil. Well Uncle Mark I'll venture to say that your young hunter in the RURAL of December 19th appears to be kind of lazy and for that reason I should think he cared nothing for the Y. H. C. nor any thing else except to keep from work. How far do I miss guessing right.

Brooks Co., Ga. A COUNTRY NIECE.

[I don't like to have people call themselves "insignificant." We must all believe we are worth more than that. I wish we could come and help eat the strawberries. That seems like a novel way of raising them. Write again.—UNCLE MARK.]

DEAR UNCLE MARK: I have been slow about writing to the Club, for I had such poor success with the beans you sent me. Please accept my thanks for them. I planted them all carefully, and 19 out of the 22 came up and grew nicely, with a fair show of beans, until the grass-hoppers came. They ate the tender, little beans, and only left me 42, which I have saved for spring planting. They are my favorite of the bean family. The grass-hoppers were the largest I ever saw; one could scarcely walk for them, they were so numerous. They took possession of our four acres of oats, and damaged the corn and many other things for us. We are having very pleasant weather now; it was quite cold last week, the ground is covered with snow. I have not made my fortune yet. I had a pig to fatten, but as pork was so low, only two-and-one-half cents per pound, I concluded to keep him over. I gathered about three bushels of hickory-nuts; they were plenty here. I sold two bushels at 50 cents per bushel. My brother Frank and myself can have all the ground we can clear for corn; we expect to have about two acres ready for spring planting. We have about 28 acres of wood land. We do not have very much time to give to the work now, as we have a mile to walk every morning and evening to and from school. We have been neither tardy nor absent in the nine weeks we have been going. We all continue to like the good, old RURAL; feel as if it was a friend; I have never tried getting up a club since my failure last year. Your nephew,

Grant Co., Ind. HERBERT LENFESTEY.

[The grass-hoppers and Jack Frost will have much to answer for. I think you did well to keep the pig. Fortunes are not made in a year. I hope you will have a good piece of land for next year.—U. M.]

PERSONALS.

CHARLES FELTON, of California, is the richest man in the National House of Representatives. He is worth $15,000,000.

NOT only is the Princess Louise not coming to Canada next Summer, but it is said she never expects to cross the ocean again.

THE Marquis of Lorne has been appointed honorary commissioner for Canada at the Indian and colonial exhibition, and also President of the Canadian Commission.

MDE. BARRIOS, widow of the late President of Guatemala, is staying this Winter in New Orleans, and she has excellent staying qualities in a fortune of more than $8,000,000.

BOOTH, known as the "General" of the Salvation Army, in England, thinks he will need fully £30,000 to carry on the campaign in the coming year, but he declines to publish a report of the expenses of this year.

THE rival revivalists, Sam Jones and Sam Small, amuse their leisure by a competitive count of their converts, and both deplore that they were unable to materially or spiritually increase their census by their recent evangelical efforts in St. Louis,

SIR AMBROSE SHEA has been appointed Governor of Newfoundland, being the first native and Catholic Governor since the days of Cabot. He has issued a proclamation forbidding an Orange procession in Harbor Grace and other parts of Conception Bay.

LAST Tuesday was the 76th birthday of the "Grand Old Man," William Ewart Gladstone, who was born in Liverpool on Dec. 29, 1809. Over 400 letters of congratulation reached him, besides a multitude of telegrams.

THE Justices of the United States Supreme Court are highly indignant at current intimations that they are hard drinkers. It is emphatically denied that they "keep a black bottle" in a closet in the cloak room, or that any of them is in the habit of drinking in the court room, or that there is a sideboard there.

DORA and Elaine Goodale, the sisters who some years ago achieved deserved notoriety as the "child poets of Sky Farm," have let their historical farm in Berkshire, Mass., for ordinary, base boarding-house purposes, and Elaine is out on the plains doing missionary work in the interest of Indian civilization.

THE Hon. David Davis is said to have prepared a volume of memoirs to be published after his death, in which appears a list of the "wolves and lambs" he discovered in Congress while President of the Senate. The wolves are those whom he knew to be for sale, and the lambs are the honest ones.

THERE are five Senators of foreign birth. Beck is Scotch; Jones, of Nevada, is English, Fair, Sewell and Jones, of Florida, are of Irish birth. There are 12 Representatives of foreign birth—five from Ireland, one each from England, Scotland, Germany, Norway, Hungary. Two others are of Bavarian birth.

HERE is a startling list of the distinguished men who have died during the year 1885. There is but one King, Alfonso XII of Spain. The most prominent in the list are the military commanders. First of all among the soldiers of our own country comes Gen. Grant, the commander of the greatest army that has ever yet been assembled, and then follow Gens. McClellan, McDowell, Sackett and McQuade. Among the European Generals were Prince Frederick Charles of Prussia, generally regarded as the ablest general in Germany after Von Moltke, and Gen. Stewart, who lost his life in the recent campaign in the Soudan, as did Gen. Gordon, the hero of Khartoum, and Col. Burnaby. Next comes Gen. Manteufel, a prominent figure during the Franco-Prussian war, and afterward Governor of Alsace and Lorraine. Among the men who have held political honors are found the Hon. Thomas A. Hendricks, Vice-President of the United States; Reuben E. Fenton, Senator Frelinghuysen, Senator Sharon, Malcolm Hay, E. K. Apgar, Robert Toombs and President Barrios, of Guatemala. The clergy lost Cardinal McCloskey, Dr. Tyng and Dr. S. Irenæus Prime. Literature lost Victor Hugo, Edmond About, Richard Grant White and Lord Houghton. Among the musicians are Dr. Leopold Damrosch and Franz Abt. The world of commerce will miss William H. Vanderbilt, Sir Moses Montofiore, Commodore Garrison, H. B. Claflin and F. Winston. The stage was deprived of John McCullough and the bar of Emory Storrs and Myra Clark Gaines.

LINSEED MEAL.

ABSOLUTELY THE BEST FEED FOR

CATTLE, HORSES,
CALVES,
SHEEP AND HOGS.

This Meal is the product of pure sound Flaxseed. Linseed being its other name, and is the most nutritious of all feed, because it contains the largest proportion of nitrogenous substance.

It is almost needless to say that, in order to derive much benefit from the use of Linseed Meal, it must be fed in quantity. At least one-half of all an animal consumes may safely and profitably be LINSEED MEAL.

☞ Please send in a sample order or for circular and prices. Orders will be promptly filled by any one of the following parties:

Cleveland Linseed Oil Co., Cleveland, Ohio.
Toledo Linseed Oil Co., Toledo, Ohio.
Detroit Linseed Oil Co., Detroit, Michigan.

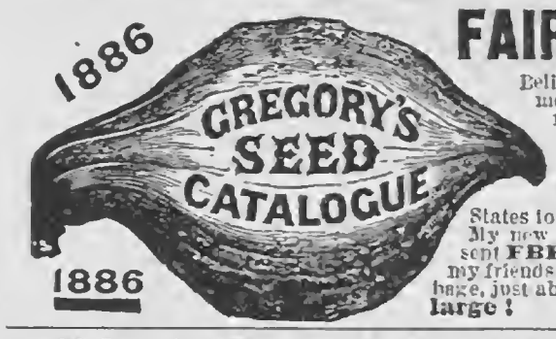
Prices reduced to suit the times. Correspondence solicited. Catalogue Free. 30th Year. 600 Acres. 21 Greenhouses. Immense Stock. **THE STORRS & HARRISON CO.** PAINESVILLE, Lake Co. Ohio.

GRAPE VINES Niagara, Empire State, and all the best varieties. Low prices for first-class stock. Jewell, Parry, May King, etc. **STRAWBERRIES** several varieties $2 per 1000. New and Old **RASPBERRIES, BLACKBERRIES,** &c. Plants by mail a specialty. Descriptive Catalogue, with colored plates, Free; contains $1, $2, $3 and $5 collections, and instructions for planting. JOEL HORNER & SON, Merchantville, N. J.



FAIR AND SQUARE DEALING.
Believing that if a man has dealt squarely with his fellowmen his patrons are his best advertisers, I invite all to make inquiry of the character of my seeds among over a million of Farmers, Gardeners and Planters who have used them during the past thirty years. Raising a large portion of the seed sold, (few seedsmen raise the seed they sell) I was the first seedsman in the United States to warrant (as per catalogue) their purity and freshness. My new Vegetable and Flower Seed Catalogue for 1886 will be sent **FREE** to all who write for it. Among an immense variety, my friends will find in it (and in none other) a new drumhead Cabbage, just about as early as Henderson's, but **nearly twice as large!** **James J. H. Gregory, Marblehead, Mass.**

Sibley's Tested Seeds
Catalogue free on application. Send for it.

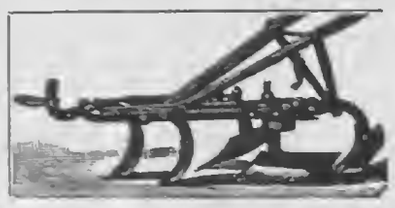
CORRESPONDENCE SOLICITED.



THE RURAL NEW-YORKER

The great national standard of Rural Journalism. It is the accepted medium for the introduction of all New Plants, Seeds, and farm implements. These are tested regardless of cost at the Rural's Experiment Grounds of 300 acres. Its Free Seed and Plant Distributions have popularized many of the most valuable varieties in cultivation. It is original from beginning to end. It employs the best writers in the world. It is the first journal to have established Experiment Grounds; the first to present careful and original illustrations of plants of all kinds, of cattle, farm and garden helps, poultry, large and small fruits, grapes, and everything appertaining to rural life. Over 500 engravings yearly. Over 600 writers. It is edited by practical farmers. It combines the best features of the daily and weekly press with all that can instruct, elevate and interest the rural home. It costs more to publish than any other weekly in America. It is for the North, South, East, West. The ablest farm and garden weekly in the land. It is pure, trustworthy, sparkling, alive, independent, and faithful. It exposes all frauds. It answers over 5,000 questions in its Farmers' Club. Free specimen copies will give a full account of its present Free Seed Distribution, and of the sterling presents offered for clubs. We want you to KNOW that the Rural New-Yorker is the best journal of its class published. It will help you to make money and to spend it judiciously. Fine paper, 16 pages, $2.00 a year. Subscribe now. Address the Rural New-Yorker, 34 Park Row, N. Y.

Humorous.

THARE is menny a slip 'tween a cup and a lip, but not half as menny as thare ought tew be.

THERE are numerous individuals who look upon the thing they hain't got, as the only thing worth having.

CURIOSITY is the germ of almost all enterprise; men dig for woodchucks more for curiosity than they do for woodchucks.

IT should be remembered to the everlasting credit of Nebuchadnezzar that though he cast Shadrach, Meshach, and Abednego into the fiery furnace, he did not ask them: "Well, is this hot enough for you?"

LADY TO SMALL BOY. "Then you have never had educational advantages?" Boy scratches his head and says: "No, mum; not that I knows of. But I've had airy-sipilas. If what you said is worse nor that, I don't wanter ketch it."

NURSE (to nervous young husband).—Oi congratulate ye, sorr. It's a foine bouncing babby. Nervous young husband (very anxious that his first-born shall be a boy).—Of course, it's a fine baby, but er—am I a father or a mother?

A DENTIST at Triangle, N. Y., once received an order for a block of teeth as follows: "My mouth is three inches acrost, five-eighths inches through the jaw; sum humocky on the edge; shaped like a horse-shoe, toe forward. If you want me to be more particklar I shall have to come thar. Yours truly——."

AN Irishman who was sleeping all night with a negro, had his face blackened by a practical joker. Starting off in a hurry in the morning, he caught sight of himself in a mirror; puzzled he stopped and gazed, and finally exclaimed: "Begorra, they've woke the wrong man!"

BOSTON girl (to Uncle James, a farmer.)—"Do you like living on a farm, Uncle James?" Uncle James.—"Yes, I like it very much." Boston Girl.—"I suppose it is nice enough in the glad summer time, but to go out into the cold and snow to gather winter apples and harvest winter wheat, I imagine might be anything but pleasant."

A SELF-EVIDENT FACT.

Horseman—"Look here! Why don't you drive that animal away? Can't you see my horse is afraid of a donkey?"

Farmer Jones—"Of course I can. Ain't he trying to throw *you* off?"

Miscellaneous Advertising.

HAYESVILLE, OHIO, Feb. 11, 1880.
I am very glad to say I have tried Hop Bitters, and never took anything that did me as much good. I only took two bottles and I would not take $100 for the good they did me. I recommend them to my patients, and get the best results from their use.
C. B. MERCER, M. D.

EASILY PROVEN.—It is easily proven that malarial fevers, constipation, torpidity of the liver and kidneys, general debility, nervousness, and neuralgic ailments yield readily to this great disease conquerer, Hop Bitters. It repairs the ravages of disease by converting the food into rich blood, and it gives new life and vigor to the aged and infirm always.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1877. NEW YORK, JANUARY 16, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Potato SPECIAL!

1. BEST VARIETIES in many sections. Earliness, quality, keeping qualities, etc., etc. The most profitable potato all things considered.
2. RULES FOR SELECTING "SEED." When selected. How treated?
3. SOIL. What preferred as regards location and character? Sod? Fallow? How prepared? Implements used?
4. HOW PLANTED? Implements? How many eyes? Whole potatoes? Rows how far apart? How deep? How far apart in row? How covered? When planted?
5. WHAT FERTILIZERS USED? Farm manure *vs.* chemical fertilizers as regards convenience and profit? How applied? On surface, plowed under, in hill, etc., etc.? Any influence of particular fertilizers as regards size, shape, color, etc.: of tubers?
6. FLAT CULTIVATION *vs.* hilling. Which best with you? What cultivation is given during the season?
7. HOW TO AVOID BLIGHT, rot, wire worm, scab, etc., etc.
8. DIGGING. Methods and implements. Sorted in field or storehouse. How long in field after digging? Use of small potatoes? Dug when ripe or left longer in ground?
9. MARKETING. When to sell. How packed? When to hold over? How to store for winter use?
10. THE IDEAL POTATO. What do we most need as regards size, shape, color and season? Views as to the improvement of the potato.
11. AVERAGE YIELD? Profit per acre? Climatic advantages necessary? Is the market improving or not? How to fight insect enemies?

[Concluded later.]

Experiment Grounds of the Rural New-Yorker.

STABLE MANURE *vs.* FERTILIZERS FOR POTATOES. TESTS OF NEW VARIETIES CONTINUED.

MANURE *vs.* FERTILIZERS.

ON no other crop have we had such telling results from the use of chemical fertilizers as compared with farm manure as upon potatoes, and this has been the case during the past eight years without any exception that we now recall. This seems to have been the experience of many other farmers. Upon oats and corn, and vegetables of various kinds, fertilizers have occasionally failed to increase the crop, while farm manures in contiguous plots have produced marked effects. The experiment which we now have to record is no exception, though all the conditions seemed favorable to a decided and impartial test.

The land (a sandy loam) had never received any chemical fertilizers, and for 15 years at least, no manure of any kind. Two plots were measured off one-tenth of an acre each, that is 132x33 feet. The first received three tons of stable manure, or at the rate of 30 tons to the acre in October. The seed potatoes (Great Eastern) were cut to two eyes each and planted April 22, in drills two-and-a-half feet apart and 14 inches apart in the drills. Both plots were cultivated once and hoed twice, the soil being kept level without any hilling up about the plants. The yield was 24 bushels and three pecks, or at the rate of 247.50 bushels to the acre, of which 80 per cent. were marketable.

The second plot received, instead of the stable manure, 200 pounds of the Mapes' Potato fertilizer, or at the rate of one ton to the acre, the seed pieces, distance of planting and treatment being just the same as with the first plot. The yield was 27½ bushels, or at the rate of 275 bushels to the acre, of which 90 per cent. were marketable. The potatoes were smoother and brighter and less injured by wire-worms than those of the manured plot.

The cost of the manure delivered was three dollars per ton, or nine dollars for the plot. The cost of the potato fertilizer was $48 per ton, or $4.80 for the plot. The guaranteed analysis of the latter was, ammonia 4.50 to 5 per cent.; phosphoric acid 8 to 10 per cent.; potash 6 to 8 per cent.; magnesia, lime, soda, etc., forming the rest.

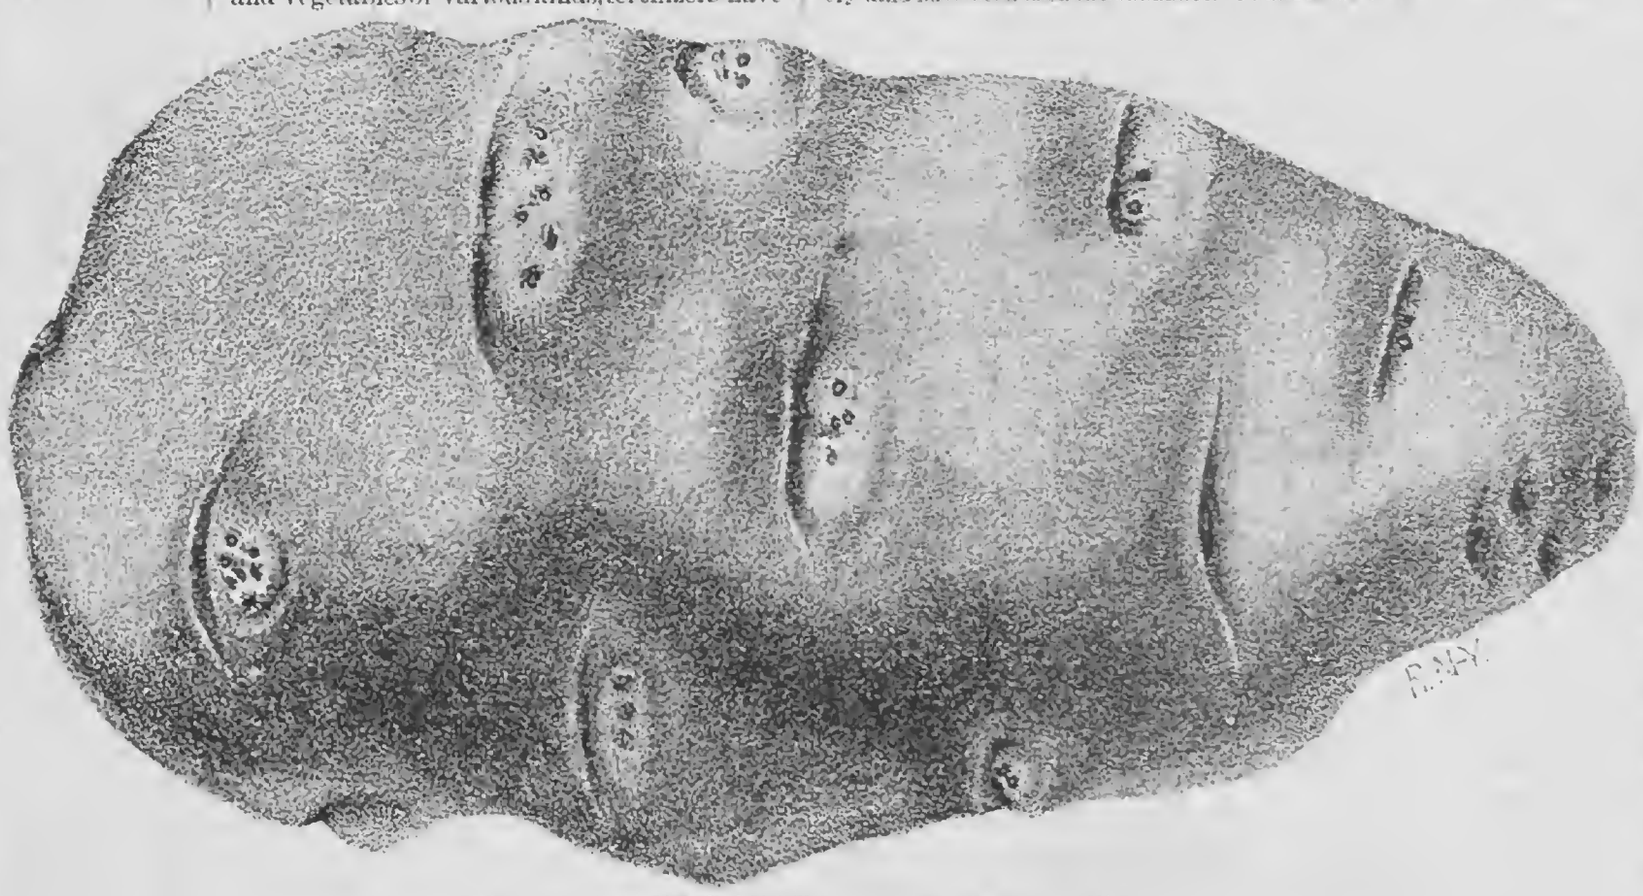
The season was unfavorable throughout.

If potatoes were again raised on the same plots next year without fertilizer or manure, no doubt the manured plot would outyield the fertilized plot, because if for no other reason, the nitrogen of the latter being soluble, has passed through the soil, while the farm manure will yield nitrogen for years to come.

TESTS OF NEW POTATOES CONTINUED

SOIL, CULTURE, ETC.

SUBSCRIBERS should understand that these tests are made in a rich, moist, garden soil. The crop never suffers seriously either from drought or too much wet, as the land is well drained. Not only has farm manure been liberally supplied, but fertilizers of every kind have been used in abundance. Potatoes have been raised on this plot for six consecutive years Trenches are dug one foot wide and six inches deep, and three feet apart. Two inches of soil are raked back in the trenches, and the seed pieces (two strong eyes each) are placed one foot apart. Two inches of soil are then raked over them, and the fertilizer is strewn evenly at the rate of about 1,000 pounds to the acre. The rest of the soil is then returned to the trenches as loosely as possible. The cultivation is then effected by hand cultivators, and hilling up is studiously avoided.



EMPIRE STATE POTATO. From Nature. Fig. 21.

EMPIRE STATE.—Received from W. Atlee Burpee & Co. of Philadelphia, Pa., who claim for it that "it is the most prolific main-crop potato ever produced." It originated with E. L. Coy of Washington Co., N. Y., who was the originator of the Beauty of Hebron."

It is further described as follows: "Skin white and smooth, eyes shallow, flesh pure, snowy-white and floury, peculiarly rich and delicate in flavor. Vines rank, tubers close together in the hill. It stands drought on account of its deeply penetrating roots."

He planted six pieces of this on April 15. The yield was ten pounds, or at the rate of 484 bushels to the acre. The best five weighed five pounds two ounces. Some hills yielded very large potatoes, others were nearly failures from some cause. We should look for a large yield of this potato in a favorable season. There were twenty-eight tubers, of which seventeen were of marketable size. Skin nearly white, eyes numerous, not deep; cylindrical, rather long. The tubers so varied in form and size that our illustration may not be typical. Eaten Dec. 2. Flesh nearly white, quite dry and mealy and somewhat nutty in flavor. See Fig. 21.

ROSE'S NEW PURPLE BLUSH—an unfortunate name since we already have the Rural Blush. Mr. A. Rose (Penn Yan, N. Y.) writes: "It is a seedling from the Blue Mercer."

We planted eight pieces April 20, which matured August 13. The yield was 13 pounds, or at the rate of 536.25 bushels per acre. There were 82 tubers, 50 of which were marketable. The best five weighed two pounds 12 ounces. The shape is, as shown in our careful illustration from nature, oblong-flattened, often smaller at one end. The skin is light buff splashed with purple. Very few eyes. Eaten October 26. Flesh nearly white, quality fair, but not so mealy as Early Rose. See Fig. 23.

DICTATOR (Rand) from Thorburn & Co., 15 John Street, N. Y. Planted April 15, six large pieces, each, as usual, having two eyes The yield was 16¼ pounds, or at the rate of of 665.60 bushels to the acre. There were 56 tubers, of which 41 were marketable. The best five weighed three pounds, nine ounces. Buff-white skin, roundish-oblong, generally somewhat flattened. Eyes medium. Good, solid-looking tubers. It is a late variety. Eaten December 29. Flesh dull white and not dry or mealy as grown in moist soil. This is always the case with potatoes of the Peachblow class as we take this to be. See illustration, Fig. 22.

PERFECT PEACHBLOW.—From W. H. Rand, Shelbourne, Vt. Planted April 20; seven pieces (two fair-sized tubers). They were beautiful, smoot hand russeted. Mr. Rand writes that "they are from seed of the old White Peachblow. So far they have given great promise."

The yield was 6¾ pounds, or at the rate of 233.55 bushels to the acre. Skin yellowish-white, smooth, often splashed with pink, Few eyes. There were 85 tubers, of which but 10 were of marketable size. Shape round-oblong.

CARMAN was received from O. H. Alexander of Charlotte, Vermont, who says that it is a cross of Beauty of Hebron on Early Vermont, two years old. Seven pieces were planted April 21. The yield was nine and one-quarter pounds, or at the rate of 319.78 bushels per acre. The best five weighed two pounds two ounces. There were thirty-five tubers, of which twenty-nine were of marketable size. There were very few small, none very large. Skin, flesh-colored; few eyes. Shape, oblong, flattened. Shapely and smooth. Late. Eaten, Dec. 7. Flesh white. It is not as mealy as some, but quite dry and fine-grained. See Fig. 24.

CULTURE OF THE POTATO.

T. H. HOSKINS, M. D.

I WILL briefly reply to the queries you send me. The best varieties with me are Beauty of Hebron, Pearl of Savoy and Snowflake. I grow some Alpha as an extra-early for home use, but it is not productive. Pearl of Savoy is the best early market potato I have had. Snowflake is not very productive, but the quality is best for a winter potato. I have grown last season a quantity of a Snowflake

seedling, produced by Mr. Macomber of Grand Isle, Vt., called the Pecan, which seems to have all the merits of its parent, with productiveness added.

My rule for selecting seed is to take well ripened, well-formed, medium-sized tubers. These I cut into pieces of two eyes each, and plant in drills, the sets ten inches apart. The drills are made from 2½ to 3½ feet asunder, according to the variety. My soil is one of the best for potatoes, a rich, deep sandy loam, ("hard-wood land"). For potatoes I plow deep, eight or nine inches, and plant about five or six inches deep. The drills are made with a Share's horse hoe with the teeth removed and the wings closed. The potatoes when planted in an open field, are covered by harrowing across the rows, and the ground is again harrowed as the earliest shoots begin to break the surface. I plant as soon as the ground is fit. As to manures, I never use dung the same season, but use a good superphosphate, sown on the furrow at the rate of about 500 pounds per acre, sowing at the same time from 15 to 25 bushels of unleached ashes. Often I use ground bone in the same quantity, in place of the superphosphate. After the fertilizer is sown, the ground is well harrowed. This, with the subsequent opening and closing of the drills, distributes the fertilizer very evenly and completely. I never plant potatoes on sod, but usually after corn. My objection to dung for potatoes is that it causes scab and predisposes to rot. With my system I never have been troubled with rot, and the potatoes show but little scab. I do not notice any other effect of manure or fertilizer upon the tubers. It will be seen by the above that I practice deep planting and flat culture and have done so for 20 years. The digging is harder, but the crop pays half a dozen times over for the extra labor. The cultivation during the season is working with a horse hoe two or three times, and pulling all weeds in the rows. Digging is done with common hoes, and the potatoes are sorted in the field. They are not left on the ground over-night; small potatoes are fed to stock. Occasionally they have been drawn to the starch factory, but not unless they fetch over 25 cents a bushel. I always dig my potatoes for the Winter as soon as the tops are all dead. They are stored in a dark cellar, in barrels. As regards marketing, I sell as many of my potatoes early as I can; and when the price drops below 75 cents the rest are left in the ground, and are mostly sold the next Spring for seed. I believe potatoes always keep best in barrels, stored in a dark, dry, frost-proof cellar.

As regards the "Ideal Potato," I should say that a well-grown Snowflake comes as near to it as possible in shape, color and quality. But there is nothing practically to object to in the Beauty of Hebron, Early Vermont, Pearl of Savoy, or even in the Early Rose, if the latter would ripen clear to the end. I have abandoned all late varieties as relatively unprofitable, though some of them are of fine quality. But I do not like bug-fighting longer than it is necessary, and in this section rust is very apt to strike late kinds before the tubers are matured.

The average yield of potatoes in Northern Vermont is probably not far from 160 bushels per acre. But to make so low a yield, a large number who rarely grow less than 250 to 300 bushels, have to be averaged with a greater number who are satisfied with a big crop of weeds and 80 to 100 bushels of potatoes to the acre. Exceptionally good crops of 400 bushels and upwards are not uncommon with good farmers, or even with poor ones on newly cleared land. The profit varies, but is greatest on the large crops. The average is not far from $20 per acre over expenses. Insects are fought with Paris-green. Prices have averaged about the same here for twenty years.

Orleans Co., Vt.

POTATOES—LARGE OR SMALL SETS.

PETER HENDERSON.

It is something not very easily understood why there should be so much difference of opinion as to what kinds of potatoes should be used for seed, whether they should be large or small, whether cut in single eyes or in halves. Now, although I have not had much practice in the cultivation of potatoes, a large experience in everything connected with horticulture leads me to believe that as good results cannot be got from cutting potatoes to single eyes, unless indeed a large portion of the nutritious substance of the potato is left attached. Experiments made with beans, peas, and other seeds that have been attacked by the weevil or other insects, where the whole or portions of the pabulum of the seed is entirely eaten out, have shown conclusively, by frequent and careful trials, that when the pabulum of the seed is entirely eaten out, the seed germ, though left sound, will not start at all, and that when the pabulum is partially destroyed, it will start feebly and make a weak plant. This is just as true of the tuber of the potato as of the seed of the pea or bean. Nature provides this substance for the germ or bud to feed on until it is able to take care of itself; and if you rob it of this substance the result will be disappointment, less or more. It has often been the custom when new potatoes were introduced, to cut them up into single eyes, in the hope of producing a larger crop from the costly seed; but I doubt very much if any additional weight of crop can be gained, and undoubtedly the vitality of the roots will be weakened for future crops, if wanted for that purpose, which with new potatoes is generally the case.

I was one of the first purchasers of the Early Rose Potato when it was introduced, paying $2.00, I think, for a single tuber weighing five ounces. In April I cut this five-ounce potato into two pieces in such a way that the surface should present the greatest number of eyes. The pieces were then placed on a shelf and kept there until they were dry enough so that the cut part had partly healed over. They were then placed on six inches of soil in a two-foot hot-bed, where the temperature, in the soil of hot-bed, shown by the thermometer, averaged from 80 to 85 degrees. The shoots soon began to start from the eyes, and as soon as they got to be three or four inches in length, they were cut off about a quarter of an inch from the surface of the potato, or far enough from the surface not to injure the dormant eyes that were yet to start. The cuttings were then placed in what are called two-and-a quarter inch flower-pots and placed in the same hot-bed and shaded and watered until rooted in the usual way. As the season advanced, shoots in great number were thrown up by the potato, which in turn were cut off, and placed in the flower-pots and submitted to the rooting process. As the first shoots grew to a length of five or six inches, the tops were cut off from these and used as cuttings, so that by the first of June this small potato of five ounces had given me about 150 plants, every one of which was equal to a set made from a tuber, for it must be remembered that the pots in which these cuttings were placed were now filled with roots. They were planted out about the 10th of June, and the crop when dug weighed exactly 450 pounds, or an increase of about 1,800-fold.

There probably would be no practical value in this practice unless with new varieties, and it is not claimed that there is any advantage in the practice when the potatoes are sold at ordinary rates; but when they are sold at the rate of even 25 cents per pound, I think that it will pay to adopt this plan. For instance, one pound of potatoes when so grown will easily produce 500 plants, making 500 hills, which with ordinary culture will give three pounds per hill, or 1,500 pounds. The manner of rooting the cuttings is not difficult, and can be done in any common hot-bed. An ordinary hot-bed sash 3x6 feet will hold 300 plants in 2¼-inch pots. These as they grow, furnish other cuttings from the tops as above described. Without resorting to hot-bed propagation at all, the potato crop may be doubled or trebled in quantity by ta kingslips from the plants planted in the open ground in June, and planting them out at once in the open field, if there is a continuance of rainy weather for a few days. The moderate thinning out of the shoots from the regular plants will do no injury to the plants. The growing of potatoes by placing the slips in hot-beds is not new, although there is but little doubt that this method has been suggested from the practice of gardeners propagating dahlias and other plants of that kind. But there is no doubt that it will be new to many of your readers, though the principles involved have been long known to practical gardeners.

Jersey City Hights, N. J.

THE POTATO SCAB.

MANY CAUSES AND PREVENTIVES GIVEN.

DR. G. C. CALDWELL.

There is a disease of the potato called, in Germany, by two or three names, which may be translated as *scab*, which is caused by a fungus parasite—Rhizoctonia solani. It appears first as small, roundish, black or brown spots, which reach about the size of a small pea. Then the skin of the potato cracks around or across these spots, and there follows, underneath them a rapid thickening of the layer of cork cells that, ordinarily, in uniform thickness all over the potato, forms the healthy skins. Still later, if the conditions are favorable, the potato rots under the scabs and finally throughout; but when dug and stored in a dry place this decay is checked, and there is only a black or brown cavity separated by a rough layer of corky matter from the starchy tissue underneath. The disease is stated to appear in wet soils, or such as are over-rich in nitrogen compounds, or alkali (potash). By better drainage and avoiding the use of fresh stable manure it disappears. That this is one of the kinds of scab met in this country is probably true. The observation so commonly made here that too much fresh stable manure, chip manure, rotting wood, or any other decaying vegetable matter, favors the occurrence of the disease, gives some support to this probability.

Dr. Hexamer, in an April number of the New York Tribune for 1880, described the scab as "rough spots at first, which afterwards become raised like blisters, and later collapse, leaving irregular holes or pits in the substance of the tuber." Whether this is the same disease as that described above, one can hardly say; but if he is correct as to the cause, "mites, minute animals which have not yet been thoroughly studied," the two accounts will not tally. Mr. Worthington Smith, in a recent little book on Diseases of Field and Garden Crops, describes the scab and the cracking of the potato together as due to a mechanical cause, and as having no connection with any fungus, except such as may make an attack on the more delicate parts of the tubers after they have been thus exposed, and insects or worms may also then assist in the ruin. He gives no explanation of the way in which this mechanical injury comes about, except to say that "continued drought, or possibly sudden and excessive moisture will cause one form of scab." He also says that "lime rubbish, builder's refuse, or some other irritating or corrosive substance in the soil is said to cause scab and cracking"—and that when the crop on only a part of the field is scabby, the irritating substance can usually be found in the soil. The disease, according to him, begins very early, and, whether scab or cracking, appears first as rounded spots or minute, open pustules.

Many who have given their opinions on the subject believe very firmly that some kind of a scab is caused by the attack of worms. When so careful an observer as the Editor of the RURAL insists that wire-worms were the cause of a bad case of scab in his Experimental Grounds, one must believe: but it cannot be the kind of scab described by the German authorities or by Dr. Hexamer. No gnawing of worms could leave such a result as they describe, unless an imitation of it should come from an attempt of he potato to heal over the wounds made by th animals. The mere presence of any number of wire-worms or any other animals in the ground with the potatoes, is not sufficient evidence that they cause the scab; but that is all the evidence which most of those who hold this opinion give us. The Editor of the RURAL would not accept such evidence, and it must be presumed that he saw more than this, or he would not be so positive. Moreover, scab occurs where there are no wire-worms. Two correspondents of the RURAL have borne testimony to this effect in the course of the past year, the potatoes being badly scabbed where not a single wire-worm was seen, nor, says one of these writers, a worm of any kind except angle-worms. It is plain that we have not reached the root of this scab business, or else there are many causes and different kinds of scab. [There seems very little doubt about it.—Eds.] No one of the causes assigned seems to cover all cases; certainly there are many instances recorded in which the trouble cannot be traced to worms, and others in which it apparently cannot be attributed to parasitic fungi.

Even more numerous than the causes are the preventives, which is usually the case where the cause is not well understood. Many are quite confident that the use of commercial fertilizers, instead of stable manure, is a rep-preventive. Others avoid the scab by putting tobacco stems in the hill; another would not grow potatoes twice on the same ground; but still another affirms that such a course will not secure freedom from the disease. Coal ashes scattered on the hills are recommended by another; salt is another preventive, and another would not raise potatoes on a peat soil. After giving to each of these and of other prescriptions the weight that they would appear to merit, it seems that one would stand the best chance of getting a sound crop of potatoes by planting, in a well-drained soil that had not been recently manured with stable manure, and dressing the crop with a complete commercial fertilizer, one containing nitrogen compounds, phosphate and potash salts. As to the fitness of the scabbed potatoes for food, concerning which inquiry is sometimes made, there seems to be no definite information. Of course, one would not relish the potato if the decay, beginning around the scab, had plainly made much progress, and should be unchecked when the crop is dug and stored; but if, as is sometimes the case, the substance of the potato is still apparently sound and in good condition throughout, there would appear to be no good reason why it should be rejected for food.

THE "IDEAL" POTATO.

PROF. WILL. W. TRACY, (Supt. D. M. Ferry & Co.'s Trial Grounds.)

I am asked to describe the ideal potato, a request it is as impossible to comply with, as to describe in a few words and to the satisfaction of all men the ideal wife, and many people seem to think that an ideal potato is not only possible, but that a seedsman should offer none but these ideal sorts, and that he is little better than a robber if he sells any sort that does not prove all that each and every purchaser hoped it would. The unreasonableness of this popular notion may be seen by looking at a few facts. I certainly am speaking within bounds when I say that there are now in cultivation at least 500 distinct varieties. I am somewhat familiar with originators of new sorts, and have within the past five years talked or corresponded with the producers of at least 500 varieties of vegetables, and am certain that with an exception not exceeding five per cent., each not only believes, but has good evidence for believing that, under the conditions he had grown it, compared with the varieties he was familiar with and judged by his standard, his sort was better than any other, and all were honest in their believing that the introduction of their particular varieties would be a real benefit, and that ultimately they would come into general, if not universal use. Now it is fair to conclude that potato growers are equally honest, and that each of the 475 varieties was believed by somebody to be worthy of universal cultivation; yet the number of varieties actually in general cultivation does not reach 25, and I think that nine-tenths of all the potatoes produced are included in five, or at most, ten sorts.

The same thing is seen in individual cases. Five years ago, a seedsman received from a careful grower a dozen new varieties for trial. They were carefully compared with each other and the best of the old sorts. One seemed to be very superior in quality and in quantity of merchantable potatoes. The next season, the trial gave the same result. And a careful inspection of it, as grown in large fields with simply good culture and by the side of those of the most productive sorts known, seemed to indicate that it was one of the best and most profitable sorts ever produced, and accordingly the stock was purchased, and the variety extensively advertised and sold, and it proved a failure, many a man condemning the seedsman as an imposter and cheat for selling it to him. It is true that many reported it all that was claimed, and the seedsman received some strong recommendations of the variety; but with the majority of growers, it was a profitless sort. Now, did the seedsman err in his judgment of this variety?

I asked a man living at the West, and who is a good cultivator, a careful observer, and has had as many as 600 varieties in cultivation at once, which three varieties he considered the most profitable, taking quality into consideration, and he replied, if he was to cultivate them and had suitable soil, he would take first a sort which the originator never could get a seedsman to advertise; second, the sort we have been describing, and, third, a very similar variety introduced by an Eastern seedsmen, and which has proved equally unpopular. I asked an extensive grower at the East, which variety he would use if he were to attempt to produce the largest possible quantity of table potatoes from an acre of his best land, and he selected this sort.

Why, then, was this potato, which comes so near being the ideal of these experimental growers, a failure? Because, first, it needed for its best development a peculiar soil, and did not come to perfection in any other. Second, in order to get a full crop, it needed rich soil and the best of culture, and how improbable it is that a new sort will receive the best of culture from the average planter may be judged from the fact that even in the most favorable localities, the average yield does not equal 150 bushels to the acre, and when the RURAL reports a yield on its trial grounds, at the rate of from 300 to 1,000 bushels per acre, its contemporaries with uplifted hands, cry "My! What a whopper!"

Now, if I am to rely upon my own observations, instead of on the theory that a potato, being a cutting, cannot improve or deteriorate by selection or cutting, I should say that the potato is greatly modified in quantity of yield and quality of product by conditions of soil culture and by the season. A variety may do remarkably well one season, or under certain conditions, and be almost worthless another season or under different conditions, and *the different varieties vary greatly in their susceptibility to such modifications* and to get the best possible result we must not only have a variety which is good, but which will respond most readily to the most favorable conditions; but such a variety will almost invariably be subjected to corresponding deterioration, if it has to contend with unfavorable conditions; so the ideal potato of experts in different locations or circumstances would not be the same, and would be sure to be different from the ideal potato for general culture.

THE POTATO.

E. S. GOFF.

SELECTION OF SEED.

THE indications based on two seasons' experiments are decidedly in favor of selecting seed tubers from the most productive hills. For the past two seasons, we have selected the best and the poorest hills from a row of ten different varieties. In the Spring we have planted four short rows of each of the ten varieties, putting in the first the single eye cuttings of the largest tuber from the most productive hill; in the second, those of the smallest tuber of the same; in the third those of the largest tuber of the least productive hill; and in the fourth those of the smallest tuber from the same. The yield, calculated per eye, shows the largest tuber from the most productive hill yielded most; the smallest tuber from the same yielded second; the largest tuber from the least productive hill yielded third, and the smallest from the same yielded least. It will be observed that in these cases the yield is not in proportion to the size of the cuttings, as the cuttings, in the second row, were decidedly smaller than those in third, and were little, if any, larger than those in the fourth.

This theory of the selection of seed has, I believe, been combated by some writers whose opinions are worthy of respect. These gentlemen take the ground that improvement by selection is impossible in plants propagated by cuttings. I think it has not been proved that vigor may not be increased by continued selection of cuttings from the most vigorous plants. But argument is unnecessary. The results of continued experiments in this direction will be worth far more than opinions.

We have tried the past season selecting potatoes in this manner on a rather large scale, and find it not very expensive. The workmen were instructed to separate the yield of each hill, and as the tubers lay drying a man passed over the rows with a basket and picked up every strikingly productive hill. I do not see, however, how this method could be practiced where potatoes are dug by machinery.

WHOLE *versus* CUT TUBERS FOR SEED.

THE results of numerous experiments in this direction may be summed up briefly: as a rule, the more potato we have planted the larger has been the yield. Large tubers have yielded more than small ones. Large cuttings have yielded more than single eyes. When it is remembered that usually but a single eye develops, it appears that practically the chief difference between whole and cut tubers is in the amount of potato used. The question as to how small the cuttings may be safely made, appears to depend upon circumstances that the potato grower cannot foresee. In 1883, when abundant rains fell during the month after planting, small sections containing the terminal cluster of eyes, gave yields fully equal to those of decidedly larger single-eye sections from other portions of the tuber. In 1885, however, when the planting was followed by a month of comparative drought, the result was quite different. The small, terminal sections yielded decidedly less than the other larger ones.

The precise office of the tuber or section planted, beyond furnishing the bud and aiding this to start in its development, is not clear. From an experiment carried on in the greenhouse, it was shown that the plant is capable of consuming nearly or quite the whole substance of the seed tuber, and that this consumption continued until the tops commenced to die. From another experiment in the garden the indications were that the plants received no benefit from the seed after they had grown to the hight of four to six inches.

HOW TO AVOID THE POTATO ROT.

The past season our varieties of potatoes rotted in relation to their lateness of maturing. The early varieties, though none were entirely without decay, rotted decidedly less than the later ones, while the latest and most vigorous-growing varieties rotted most of all. Whether this is because the more vigorous foliage of the later varieties is more favorable to the growth of the fungus, or because the fungus has a longer time to act, I do not know. The practical suggestion, however, is to plant potatoes early to avoid the rot. The disease seldom secures much foothold until late in Summer.

The high-hilling system as preventive of rot, from which so much is hoped in England, has not, so far as I know, been tested in this country during seasons of rot.

FIGHTING INSECT ENEMIES.

Last season the potato beetles appeared in unusual numbers. To avoid injury to the young plants, we resorted to the primitive mode of hand-picking. We carried on this work thoroughly, and were little troubled from the larvæ. Although this is an expensive method, it appears to be a very sure one. Many are of the opinion that Paris-green does little benefit when applied before the first brood of larvæ hatches. It was found that this poison, mixed with plaster, at the rate of one part to 100, killed about 50 per cent. of the beetles. For the larvæ, one part of Paris-green thoroughly mixed with 150 parts, by weight, of land plaster, dusted over the foliage, has proved entirely efficacious.

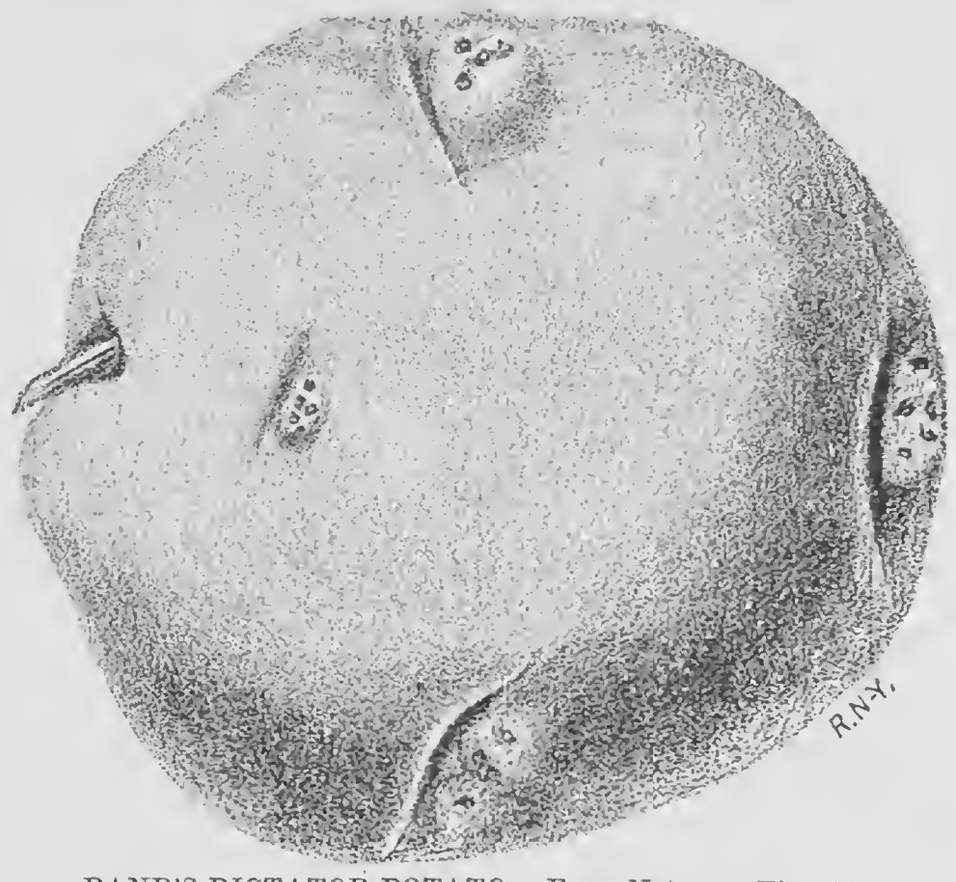
Geneva, N. Y., Exp. Station.

RED STREAK IN THE LATE ROSE POTATO.

DR. W. J. BEAL.

A PROMINENT man of Grand Rapids, Mich., asks, "To what extent does the 'red streak' exist in your locality, and what is the loss incident to such defect? Is the seed running out? If not, what in your opinion is the cause?"

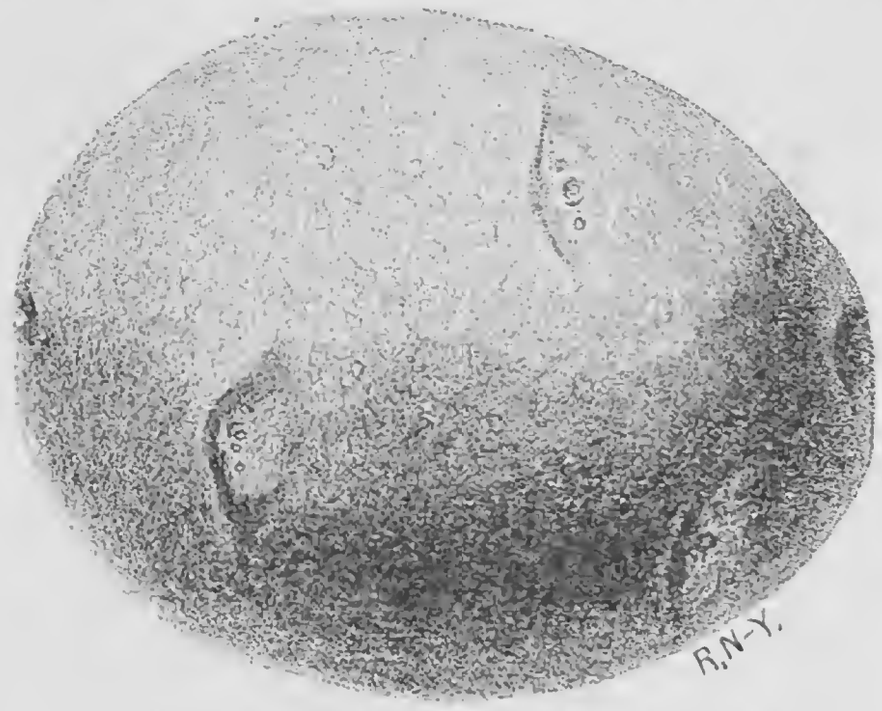
I have made some inquiry and studied the subject somewhat, and find the "red streak" pervades the Late Rose in this part of the State also, rendering them unsalable. When boiled, they crack open before done, and come to pieces a good deal; but the streaks still show and other places look yellow and soggy. The taste is not bad. On splitting a fresh tuber, not far from the margin, in an irregular line, is the outline or outside of a reddish streak. Inside of this, throughout some tubers, we find more of less red. At the eyes, the streak extends to the surface. This marginal line of red is along what would be the outside of the pith of the potato—for a potato is a real stem and has a part representing pith, another faintly representing the wood, and one the bark, including a corky layer outside.



RAND'S DICTATOR POTATO. From Nature. Fig. 22.

Potatoes are more or less decayed this year. The last of Summer and Autumn was wet and cold.

On magnifying a thin slice of a "red streak," 500 diameters, we find that some of the cells contain granular particles of a reddish-brown color. These contain less starch than some of the others, and some of the starch grains are more or less decomposed. Bacteria were also seen in large numbers, indicating incipient decay in several specimens examined, although to the unaided eye there was no sign of rotting.



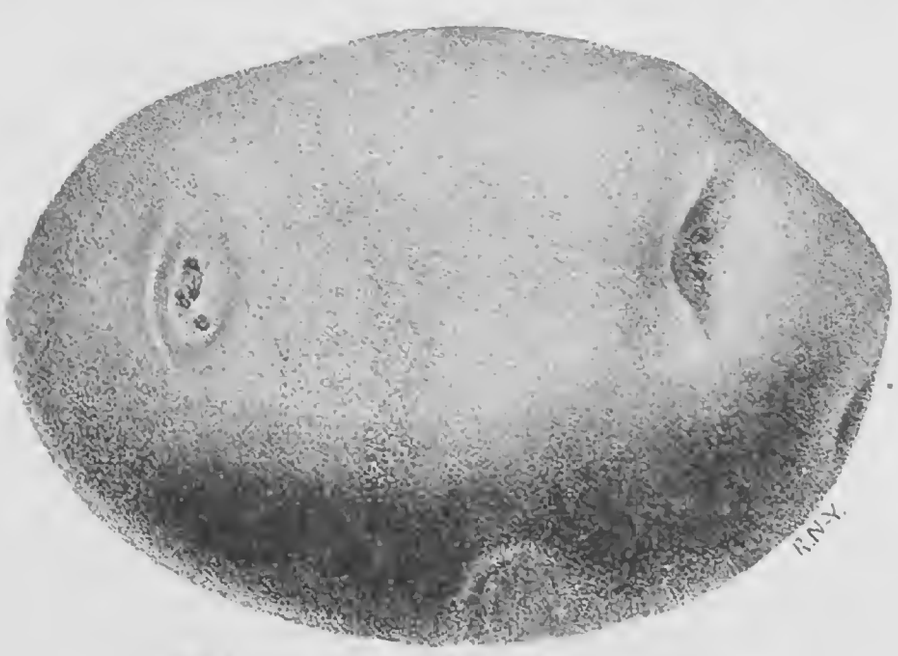
ROSE'S PURPLE BLUSH POTATO. From Nature. Fig. 23.

What is the matter? The reply might be "The Rose-red has struck in." The old Mercer or Neshannock had faint purple streaks inside. The old Merino had red streaks more or less apparent, especially toward the last of its career. I have just been looking over some small, wild potatoes from Colorado, (Solanum Jamesii), and find a sharp purple streak inside the skin. The inside or main bulk of the tuber is white. The corky layer is very thick. In time this tuber might become larger, whiter and good to eat, and after a while the purple might "strike in" and the potato go out of use.

This has been a bad year in Michigan for potatoes, and they show their faults, which have been increasing by bad treatment, for some years.

Some years ago I tested over 350 sorts of potatoes for several years, and with our treatment, which was about as good as the average, many of them dwindled and became worthless, some failing entirely to produce a single tuber. Most likely, with plenty of potash and vegetable mold on the Rural Farm, you might hold them up to the standard, or even improve them. I should say this Late Rose was on the decline, and must be replaced by others. If some one has some good, nice edible tubers—and no others are fit to plant—he may yet raise the Late Rose, but its day must come sooner or later.

Ag'l. Col., Lansing, Mich.



CARMAN POTATO. From Nature. Fig. 24.

VALUE OF POTATOES AS STOCK FOOD

PROF. E. W. STEWART.

THE potato has long been used as a food for our domestic animals, and especially in years of great crops, when their use as human food furnishes but a partial market. English farmers have used them as food for various animals. They are relished by horses, cattle and sheep in the raw state; but it is not safe to feed them in this way, except in very limited quantity. In the raw state, they are not well digested, and produce a laxative condition of the bowels, and for this reason a few quarts are beneficial to the horse medicinally, and the same for working oxen and cows; but if fed in as large a quantity as one-half bushel per day to milch cows, the quantity and quality of the milk will be reduced.

To the pig, they are not nutritious in the raw condition, and are not relished except two or three at a time. But when boiled or steamed, the pig eats them greedily and thrives upon them.

Curwen, in 1801, was the first to test the value of potatoes for English work horses by steaming them, and to show the extent to which he used them, he fed 420 short tons in a season. He used them in lieu of hay, and at first fed the steamed potatoes alone, but he found the horses had trouble in masticating them—probably they adhered to the jaws in their soft, sticky condition. He then mixed in a small proportion of cut straw, and this removed the difficulty and promoted digestion. It gave bulk and porousness to the food in the stomach. He found, in fact, that seven pounds of cut straw were necessary to prevent flatulent colic. His daily ration was 21 pounds steamed potatoes, seven pounds of straw and eight pounds of oats; and this furnished a full, healthy ration for heavy farm horses. He rated potatoes as worth $9.60 per gross ton, which is equal to 25.8 cents per bushel, as food for farm horses. This is somewhat higher than they are rated here as food for stock.

Diseased potatoes are sometimes fed to stock, and when the disease has not affected more than the skin, this may safely be done with the proper treatment. If the potatoes are well washed and thoroughly cooked or steamed, the disease is arrested, and the germs are killed. If these cooked tubers are now placed in an air-tight cistern or silo, and compressed into a solid mass, and covered so as to exclude the air, the food will keep unchanged for months. In this way, the feeding value of potatoes might be saved on a large scale, when the disease proceeds slowly, but often it has gone too far before the tubers can be dug.

There never has been any doubt expressed by those who have experimented in feeding potatoes, as to the benefit of cooking them, or of the necessity of cooking them for pigs. And there is a point here worthy of consideration. Why should the cooking of the potato be more beneficial than the cooking of turnips, beets, carrots, etc? Or why should it be deemed essential with the potato, and not with these other roots? Is it because of the much larger percentage of starch in the potato? I think this the probable reason. Starch, as is well known, will not dissolve in cold water, and it is found that it does not fully dissolve without heating to 162 degrees or higher. When it dissolves it doubles in bulk. This renders it less dense or concentrated, and therefore more easily acted upon by the digesting fluid. This may explain why horses easily digest potatoes after they have been cooked, but not before.

In this view, we may suppose that the experiment of Dr. Sturtevant at the New York Experiment Station may be quite reliable, and yet not decide the question as to the value of cooking food for stock. His experiment related only to the albuminoid matter, leaving unconsidered the much larger class of non-albuminoid elements of food. There may be a small loss in the albuminoid elements, and a much larger gain in carbohydrates or heat and fat-producing elements. When it is proved

hat cooking renders food less valuable for animals, it will establish the same fact as applied to the food of man. But there are degrees in cooking, and much that is called cooking is not worthy of that designation, and yet the most sweeeping inferences are drawn as if the whole question were settled.

Let us now consider the comparative value of potatoes as cattle food. Analysis gives the potato 2.1 per cent. of digestible, muscle-forming matter; 21.8 heat, or fat-producing food, and 0.2 per cent. of fat. This, when figured by the German standard of value, gives twenty-nine cents per 100 pounds, seventy-five pounds being water. When corn is figured at $1.11 per 100 pounds, it is on the same basis as 100 pounds of potatoes at twenty-nine cents. This makes 100 pounds of corn nearly equal to 400 pounds of potatoes. But in feeding pigs, it would be much better to feed fifty pounds of corn meal with 200 pounds of cooked potatoes than to feed all corn meal. The bulk of the potatoes would divide the corn meal, and render it more porous in the stomach, and thus more digestible. But neither the corn meal nor the potatoes have a sufficient proportion of muscle or bone-producing food to grow young pigs, and should be fed with bran, oats, barley, peas or linseed meal. Potatoes are well-adapted to fattening well-grown shotes. And from this discussion it will be seen that about once in three or four years, the market is so overstocked with potatoes as to make them economical food for horses, dairy cows, sheep or pigs, as they often sell at fifteen cents per bushel.

For cows they may be mixed with bran, and when only a few quarts are fed per day, they may be sliced up and fed raw. In such small quantity they have a healthy action upon the stomach, and the same may be said if given to horses, in doses of four pounds per day to each horse. They will give them a better appetite for other food.

Erie Co., N. Y.

A POTATO TRIAL AND EXHIBIT.

BY THE EXPERIMENT DEPARTMENT OF HOUGHTON FARM.

THE best method of cutting pototoes for planting has been long disputed and a variety of conflicting opinions have been made public.

In 1884 it was decided to try and contribute something to the knowledge of this subject, by making comparative plantings at Houghton Farm and instead of reporting the result in figures, exhibiting at various fairs, the potatoes themselves, just as grown, with such marks and explanations as would enable everyone to judge for himself as to the facts.

Accordingly, at the New York State Fair of 1884, the well known potato grower, Mr. N. F. Pierson, of Seneca Castle, Ontario County, was engaged to make up a collection of a few pounds each from 100 to 150 varieties successfully grown by him, to include a number belonging to all the established classes or families of potatoes. Mr. Pierson kept the seed through the Winter very successfully and sent the collection to Houghton Farm in the Spring of 1885. As received on the first of May, the potatoes were in excellent condition and represented 130 varieties divided as follows: eight new early varieties, 32 approved early varieties, 24 new late varieties and 60 approved late varieties.

The place selected for planting was part of an old garden, cropped for two or three years with onions and cucumbers for seed. The soil was similar to the black soil so well-known in the onion-growing districts of Orange County It was not first-rate potato ground, but was convenient for the purpose and well protected from interference and accidents, which was an important point. The land, after being put in a good mechanical condition, received a moderate and very even dressing of muriate of potash and phosphatic lime, harrowed in.

The land was carefully laid out in squares, a space nine feet square being allowed for every variety. It was decided to plant the potatoes in three different ways as to form of seed, and with three hills in each way, to guard against accident. This gave nine hills of every variety, and the whole field was planted three feet apart both ways. A large stake marked with the number of the lot, was set at the middle of every square. It would have been difficult to find anywhere, a piece of land more uniform in every respect throughout its area, and less liable to affect single hills of potatoes from local causes.

The potatoes were planted on the 20th of May (the ground not being suitable earlier), and as I selected and cut all the seed, while my principal assistant, Mr. Emery, planted every hill, I am certain that in this part of the work, all were treated exactly alike, and there was no possibility of error. The squares of different varieties were so placed, that the hills of like seedings formed rows across the field, and the different kinds were planted in the same order, as that in which they were exhibited at the Fairs. The earliest varieties were together at the left and so on to the right, where the latest varieties were placed. Of every variety, three hills were planted with one fair whole potato, about the size of a hen's egg; three others had in each hill one good-sized piece of a good-sized potato, the piece having three or four eyes on it; and the three remaining hills were planted each with one eye upon a rather small piece cut from a good-sized potato. It is needless to add that throughout the growing season the hills of the whole lot, were treated exactly alike; no operation was performed which would affect the produce of one hill that was not applied to all the hills, the same day. The usual culture of field potatoes was followed, but very little hilling was done.

The season was extremely unfavorable for the crop. During the months of June and July, the rainfall was less than four inches, instead of from 10 to 12 inches for the same months in several previous years. At the time therefore, when the young plants most needed water to make their growth, they got none, but were, instead, subjected to most intense dry heat. It soon became apparent that this would tell disastrously upon the productiveness of the crop, but as all varieties and the different ways of seeding fared alike, it was felt that the experiment might be profitably completed. The early varieties naturally suffered most, and this was apparent to every one who saw the exhibit. Abundant rains in August were of great benefit to the late varities, and these were mostly in vigorous growth when it became necessary to dig them for the Fairs. All were dug between the first and the twelfth of September. At this time, one of the early kinds (the Bermuda Pink Blossom, an imported potato) was still green and growing, and of the 88 late kinds, 50 were ripe, while 38 were more or less immature.

The harvesting was carefully supervised by Mr. Emery, one hill at a time, and everything half an inch in diameter was saved. The total product of every hill, when dry and clean, (but not washed), was weighed, all the tubers counted, the number merchantable counted, and then the whole put away in a stout paper bag plainly marked, all the facts being carefully recorded.

Exhibits of the products from these plantings were made during the Autumn at the New York State Fair, Albany, the Orange County Fair, Newburgh, N. Y., the Deerfield Valley Fair, Charlemont, Massachusetts, the Hampshire, Franklin and Hampden Counties Fair, Northampton, Massachusetts, and at the Virginia State Fair, Richmond. The method of display at all these places was substantially the same. On the exhibit table the potatoes were arranged in three rows according to the different methods of cutting and planting the seed. One-hundred-and-twenty-eight (128) varieties were shown, and the whole product of the three hills of every variety, that of each hill in a small wooden tray by itself. There were thus 384 trays in all. The back row of 128 were from the whole potato as seed, the middle row from the usual cutting and the front row from the single eye planted. Every hill or tray was plainly marked with the name of the variety and the method of seed planting. Examined from left to right, every row showed the effects of the same way of cutting upon different varieties. From back to front, in sets of three, the same variety in different ways. As a whole, the potatoes were inferior in quality, although in several cases, single hills produced from three to five pounds. But that was immaterial, the exhibit was not intended as a *show*, but as *an object lesson*, giving at a glance the results of these three ways of planting. Large cards accompanying the exhibit, gave the average results in figures. These may be condensed as follows;

Average of 128 varieties of potatoes. Method of Seed Cutting.	Whole number of potatoes per hill.	Number of Merchantable potatoes per hill.	Average weight per hill. Oz.	Average weight of the tubers. Oz.	Computed product per acre. Bushels.	Area required for 100 bushels. Square rods.
Whole potato (back row)....	23	9¼	48	2.1	316	51
Usual cutting (middle row)..	13	6½	33	2.5	215	74
Single eye (front row)...	10	5½	28	2.8	185	86

One set of these figures may be deceptive; although it appears that the average weight of the potatoes in the front row (single eye planting), was the greatest, the number of large potatoes was greater in the back row, and the largest potatoes were there also. Therefore in every way of viewing it, so far as this one trial is concerned, the planting of the fair-sized whole potatoes was the most satisfactory in result. And this was not the result with a single kind, but the average of 128 different kinds, treated exactly alike in every respect except the form or cutting of the seed.

HENRY E. ALVORD, Manager.

POTATO GROWING IN OHIO.

W. I. CHAMBERLAIN.

SOIL.—It is not wise to attempt to grow potatoes in quantity unless the soil is well adapted to their culture. The best soil, on the whole, is a rich sandy, or gravelly loam, verging enough toward a clayey loam to retain fertilizers without leaching; but sandy or gravelly enough so that heavy rains will not remain stagnant or keep the soil saturated long after the rain stops. This retards growth while the tubers are forming, or rots them after they are nearly grown. Rich, clayey loams, thoroughly tile-drained, are next best. Soil that is too sandy is not rich enough and will not retain applied manures well. Black muck soils are apt to give overgrowth of tops and not so good a quality of tubers. Be sure that your soil is right before you embark largely in potato growing.

LOCATION.—High land, not subject to early frost, is essential if you wish to raise the late varieties, like the old Peachblow, or the Peerless, or the Victory, though the last two are earlier than the first. Gravelly, second or first bottom will do for early varieties, planted late, but is too much subject to frost to risk the late varieties or the very early planting of any variety.

PREPARATION.—If there are reasons for fall-plowing, by all means plow again in the Spring, and see that the soil is worked fine and six or eight inches deep. If fall-plowed, cultivate thoroughly and deep before plowing in Spring, and then, after plowing, cultivate down with the cultivator, or Acme, or Randall, or Thomas harrow, weighted till you *meet the top cultivation* that was plowed under. This plan will work, if you have an unplowed corn or potato field, cultivate deep before plowing in Spring, and turn this four inches of fine earth, with the plow, right down where the roots can luxuriate in it all summer long. If the weather is dry, it may give success instead of failure.

MANURES.—Do not apply fresh or unrotted manure in the Spring. If well rotted, and you have a Kemp manure spreader, and want the very best results, apply half on the surface, and thoroughly cultivate it in; then plow under, apply the other half, and cultivate that in most thoroughly. Then there will be no lumps of manure to cause scab, or great unevenness in size of the tubers, and the roots will find fertility *all through* the soil. If you have no manure spreader, and want to use your manure green for fear of waste in rotting it (and it takes skill and care to rot manure without waste), then plow your green manure under the year before, and raise some rank feeding crop, like corn or Hungarian grass or millet, on it, and use the ground for potatoes *the next year*. *Do not fuss* to manure in the hill if you live in, or west of Ohio. The practice is too fussy and expensive, and that is not the place for manure. Even commercial fertilizers should be applied broadcast (600 to 800 pounds per acre), or at least not in direct contact with the seed or young tubers, in any considerable quantity.

HILL OR DRILL.—Drill planting gives more potatoes per acre. The Rose varieties may be planted in rows, 32 inches apart, and single eyes or two eyes to the set, a foot apart in the rows, provided the soil is very rich and well tilled. More bushing and spreading top-growers, like the Peachblow, need more room.

DEPTH depends on soil and season. My best success has been secured at about three inches, deep enough so that you can cultivate and weed broadcast with the Thomas harrow till the tops are six inches high, and shallow enough so that the seed may feel the warm sun and start the growth early.

HILLING UP.—I favor a moderate ridge along the drill rows, especially on heavy soil. The potatoes are dug more easily. But too much hilling is not good; and if the land inclines to wash in heavy rains, the rows should, if possible, be *across*, and not up and down, the slope; and the soil should be kept flat and well tilled between these slight ridges so that the rains may soak down readily to the growing tubers.

VARIETIES. — Since the Colorado potato beetles have been so numerous, it has seemed to be more profitable, in Ohio at least, to raise the early-maturing varieties even for the main crop. You don't have to fight the bug so long, and the yield is as good and the tubers are about as good keepers. Years ago the early varieties did not yield so well, but the introduction of the Rose family has been a great boon to potato growers. In form and quality they are all that can be desired, and most of the seedlings of this family are prolific bearers. The RURAL never did a better thing than in introducing the Beauty of Hebron. It is more prolific than the Early Rose, and of excellent quality. On the whole, four of the most satisfactory sorts are the Beauty, the Burbank Clark's No. 1, and Mammoth Prolific. The Snowflake is a choice potato, but it will not yield like the Beauty of Hebron.

SELECTING AND CUTTING SEED.—I believe that pedigree and selection pay in potatoes as well as elsewhere. I would select fair, smooth, well shaped, medium-sized potatoes for seed. If the soil is rich and well tilled, and moist at planting and kept well tilled, the seed may be cut to one eye, provided an equal portion of the potato, as nearly as may be, is left with each eye. From the eye end of the potato all the eyes should be cut out but one, and all the "meat" be left on that.

HANDLING AND MARKETING.—Until the tubers are thoroughly ripe, so that the skins will not slip at all, the use of square wooden bushel boxes is a great help in marketing; and it pays to keep them in the field all through the season to facilitate the handling. Where large quantities are grown and marketed, 100 of these boxes, each with a wooden cover for shade and rain protection, are almost indispensable. In picking up, the boxes can, with good yield, be each filled almost without moving, and a wagon can at any time be drawn along the row and loaded in a few moments. The crop is, however, at best so heavy, so hard to handle, so susceptible to loss from frost, rot and shrinkage, that it is wise to market directly from the field when that is possible, and crops are fairly remunerative.

PROFITS. — When the soil is adapted and skill, business energy and sagacity are used, potato growing as a specialty pays good profits. But there must be either a chance to purchase stable manure cheap, or else the farm must be large enough to raise clover and other crops in rotation and produce considerable manure, and have the same field in potatoes not oftener than twice in six years, or there is liability to soil exhaustion. The history of potato growing in Ohio for 40 years justifies this statement.

Columbus, Ohio.

WHERE WE MUST LOOK FOR IMPROVEMENT.

DR. E. LEWIS STURTEVANT.

SUCH views as I have to express on the improvement of the potato must be considered rather as tentative than as conclusive, as they must be put to test before any claims can be made. We seem to have attained to the limit of progress in certain directions. So far as size, shape and quality are concerned, varieties can be named which we can scarcely expect to have excelled. Improvement, therefore, it seems to me, must come from two directions. First, in securing increased prolificacy; this we have reason to believe can be accomplished by using for seed, year after year, tubers from the most prolific hills of the preceding crop. Two years' trial of this course has showed marked gain. The next improvement to be considered is hardiness and the power of resisting rot; we may obtain this as well perhaps as different flavors from originating new varieties, through crossing of the wild potatoes and careful selections from different regions. There seems to be some hope in England that such results may be obtained through the use of Solanum maglia, as this potato has the property of bearing its tubers at a great depth below the ground, and presumably below the influence of access of rot spores. I have been unable as yet to obtain any seed of these wild species. If our Government, however, should send to South America and obtain tubers from the wild species and wild varieties found there, and should distribute these tubers among careful men in various portions of this country, I think, in the course of time, some very valuable results might come from it.

The ideal potato, in my view, should be of medium size, of fine shape, white color, without sunken eyes, and of early maturity, or in other words, quick-growing. It should be hardy, rot-resisting, should grow its tubers closely together in the hill, and should be prolific.

Geneva, N. Y.

POTATO NOTES.

JONATHAN TALCOTT.

IN regard to the culture of the potato, there seems to be no royal road to the most complete success, that can be adopted by all cultivators on all soils. In my experiments, success is sometimes attained when and where least expected.

Early in the present century, when my ancestors first settled on the farm on which I now reside, when the land was newly cleared of its heavy growth of timber, crops of four or five hundred bushels per acre were common, without any special care or attention, and if the farmer got his potatoes planted before the Fourth of July, and especially if planted in June, they were thought to be put in quite

early, as such a thing as a failure in the potato crop in this section was then unknown. Now all is changed; the soil is not in its virgin richness, it is also more compact from continued cultivation. All the small roots of the forest have gone to decay and the soil is in consequence much less aërated. Insect enemies are more numerous, and the result is a much smaller crop of inferior potatoes than used to reward the labors of our ancestors.

Some portions of the farm seem better adapted to the growth of potatoes than others, although no perceptible difference can be discovered in soil or situation. Some of the best crops ever grown by the writer have been grown on drained land, that, previous to drainage, was so wet as to be wholly unfit for cultivation, probably from the fact that the soil, when drained, was made dry and comparatively new, as when the land was originally "chopped off" its timber, it was found after cutting the timber into logging lengths for burning, that it was too wet for cultivation and thus left, and a growth of brush, such as would grow in wet soils, grew up, and in that state I found it, and then used the first tile ever laid in this country, so far as I know.

At other times I have raised large crops on what I considered good land well prepared; also on what was thought to be poor land poorly prepared. Crops of this kind were raised in 1870, on both kinds of soil, which received both kinds of fitting; both were planted the last of May, after all other spring planting was done, and both pieces were planted with small, shriveled seed of Early Rose Potatoes. One piece was ground that had grown a crop of corn the year previous, manured and fitted for cabbage. This piece was very mellow. The other was on the sod where a tile drain had been put in late in the Fall before, in a meadow, which was intended to be plowed for potatoes that Spring; but it was not done, and, as a last resort, the ditch was plowed in the Spring and a few furrows were plowed on each side of the ditch, and three or four rows of potatoes were planted lengthwise on the drain, some 40 rods in length. The soil, a compact clay, was so lumpy that it was with difficulty that the potatoes could be covered with sufficient earth to hide them from sight. Then a few loads of wet straw were drawn and put on the hills, and nothing further was done (except to pull a few weeds that grew in them) till they were dug. Both pieces yielded about alike—between three and four hundred bushels to the acre. The great secret in the success was copious rains when the tubers were setting; while all early planted potatoes suffered from drought when the tubers were forming on my farm. In these experiments, during all the time of their growth, everything seemed favorable. On the piece well fitted I expected good results; on the other I did not, but they seemed to thrive equally well, judging by their yield.

The past season a piece of ground was fitted by manuring with rotten manure from the barn-yard, and plowed in the Fall of 1884, refitted the past Spring, and a portion manured with green manure, and a large crop was confidently looked for, but the result did not meet anticipations. A large crop grew, but the largest share rotted and was left in the field. That portion manured with fresh manure last Spring was the freest from disease.

The Beauty of Hebron is the best tested early potato with me, and the White Star for a later one, for yield and profitable culture. The Thorburn Potato promises well—not a rotten one in the crop. They are longer with me than the RURAL represents them to be in the engraving in a late number. I had great hopes of the Empire State, but, alas! they were blasted: we found the largest half of an extra good crop rotten at digging time. Had our crop all been dug the last of August, and stored in a cool cellar, I have no doubt we should have saved them all from rot; but, of course, the tubers were not then fully grown or matured, but they would have been much better than rotten ones later in the season.

The Beauty of Hebron, White Star, and the Thorburn Potato, are good models in my estimation, in color, size, form, etc., for a market potato; while Dakota Red, and Wall's Orange are neither handsome in form or color, nor of quality good enough for table purposes, as grown on my farm. Dakota Red will yield abundantly; but the tubers are rough and unsightly for the table; while Wall's Orange has never yielded half a crop with me, and will be wholly discarded in the future.

So far as my experience goes, not one new sort in a dozen, is worth having as a gift, much less when we have to buy them at enormous prices. The greatest "sell" that I was ever caught in, was in the case of Wall's Orange at $1 for a quarter of a pound. However valuable it may be in some localities, it is of no value to me.

To sum up the peculiar features of potato culture; a farmer must know by actual trial on his own grounds what varieties succeed best, in order to attain the best results in potato culture; also, if possible, at what season he had best plant his crop to have a plentiful rainfall, to benefit at the time of setting the tubers; also the fields best adapted to the growth of potatoes; then he must act accordingly. In a series of years a farmer, acting on such general principles, will be more likely to be successful, than one who plants such sorts as he may have on hand, and at such times as best suit his convenience, without regard to the quality of the seed, or its adaptedness to his soil, as it is now a well established fact that a variety that succeeds well in some localities, is comparatively worthless in others.

Rome, N. Y.

THE PAST SEASON'S EXPERIENCE.

WM. W. HAWLEY.

SOIL, hard-pan and clay, that had been cleared of timber upwards of 60 years and cropped nearly every season; it has not been clovered in seven, or manured in ten years; I gave $10 per acre for the use of it the past season. Cultivation, trench, flat culture, 200 pounds Mapes Special Potato Phosphate per acre in top of drill. I grew 100 varieties, of which I have 655 bushels of sound tubers; about one-third are small and not marketable. Vick's Extra Early proved the earliest by 10 days; the Rural Blush, the latest; Well's Jumbo, the most productive, 47 pounds merchantable from one tuber; the Early Ohio, least productive. The Hawley is a seedling of my own, three years from the seed-ball, a cross of the Burbank and Beauty of Hebron. Potatoes suffered badly from rot in this section; mine were the least affected that I have seen this season. I think phosphate saved them; I threw out about 10 bushels. My neighbors tell me that the tubers left in the ground late in the season are the ones the wire-worms work on; mine were not infected. This is fast becoming a great potato country. Arkport, a small place near here, handles 10,000 bushels per day in the shipping season, which lasts about eight weeks. White Star, Albany Seedling and Burbank sell the best; the buyers pay 55 cents for 62 pounds; while the White Elephant, Beauty of Hebron, Early Rose, Queen of the Valley and other reddish potatoes are 50 cents for 62 pounds.

Hornellsville, N. Y.

CLEAN TILLAGE FOR POTATOES.

H. IVES.

WITH us, the potato has come to be a favorite special as well as profitable crop. It has gone through a process of development. Years ago it was considered worthy of only a "patch" of an acre or so. A few coarse varieties were planted without effort to keep them separate, and nothing used in their cultivation but an old-fashioned hoe, from the planting of the seed to the digging of the crop. The market was confined to the shoemaker, the blacksmith or the storekeeper, who each took a few bushels in "trade." Now, the potato is considered one of the most important and profitable crops on the farm. The best fields are assigned to its culture, expensive varieties selected for planting, suitable tools obtained, often at considerable expense, and the greatest care spent in tillage. In fact, the potato is considered in many parts of the country, to-day, the best paying cash crop that the farm produces.

Experience has taught the cultivator who aims to produce a profitable crop of potatoes, that with proper tools and horse power he can do much better work than when obliged to depend entirely upon hand labor. It has been proved, also, that by thorough preparation of the seed-bed, and by working the crop often and well through the season, with tools suited to the different stages of the work, all hand-work, except that required in dropping the "seed" and in picking up the tubers, may be dispensed with. By means of horse power the work can be done cheaper, better and more easily than under the old system of hand labor.

Farmers believe, as a rule, that the potato needs to be planted three or four inches deep, so they need a special marker. Then, as the seed is covered deeper than most others, a special tool must be provided for this purpose. After planting, the vines are so long in coming up, that the weeds will occupy the hill and crowd the vines out unless prompt cultivation is given at this critical time. If the weeds can be destroyed just before the vines appear above the ground, the rightful owner of the hill can develop before another stock of weeds can grow. Thus it will be seen that this work must be done at once in order to insure clean culture for the rest of the season. It is a light job and easily accomplished, but requires immediate attention.

For this cultivation a light smoothing harrow is excellent. Many farmers use a plank scraper drawn by one horse and brushing down the ridges of two rows at once. Any tool that will insure a slight stirring or movement of all the surface earth of the hill, will fully accomplish the desired object. If the "seed" has been planted less than three inches deep, it will answer just as well to run a shovel-plow through the rows, so as to throw an inch or two of fresh earth over the hills. This can be done even when the plants are one or two inches above ground. This latter plan has been practised about here very successfully whenever thoroughly performed. Where any portion of the row is left uncovered, a cluster of weeds will be sure to grow, unless removed by some other means. If this first work is done in a thorough manner, the ordinary horse-work of alternate cultivating and shovel-plowing, if done every week or so through the growing season, will insure good tillage and clean culture for the crop without any hand hoeing or weed pulling. Not only this, but such thorough and frequent tillage will keep the spaces between the rows as clean as a summer-fallow, and will be most favorable to the growth and full development of the potato plant. The rapid and rank growth of the vines will destroy any weed growth in the hills. I know 18 and 20-acre fields cultivated in this way, that do not produce an armful of weeds, while the work is done as well as by hand work, and the cost is less than one-half. Under the old system it was all one man could do to hoe half an acre in a day. Last year in thoroughly cultivating an eleven-acre field, I spent a little more than half a day of man and horse, or six days for the whole field.

Various machines for digging potatoes have been invented. A few of them do fairly well, digging from three to five acres per day. Better ones will doubtless be made in time. The object to be gained by such a machine is twofold: the hard and heavy part of the work is performed much faster and cheaper than by hand labor, and the tubers are freer from pricks and markings. Then again, the act of running a machine through the soil in digging, produces a good fall working, freeing the land of all growth of weeds, leaving it it good condition for succeeding tillage and cropping.

Batavia, N. Y.

POTATO CULTURE.

PROF. J. W. SANBORN.

QUALITY.

THOSE farm products that are consumed more as luxuries than as necessaries, and which derive their value from their capacity to minister to the desires of the palate, should be cultivated with reference to quality as a central purpose, and be sold upon the basis of quality so far as possible. A large, urban population and great incomes pay well for skill in refining our farm products.

Potatoes may be classed with the luxuries, for as a source of food they are relatively quite costly. Our tastes demand a medium-sized, light-colored, smooth and mealy, or starchy potato. This standard can be easily controlled. The starchy potato is a product of light or sandy loam soils, and even here may be injured by the system of fertilization. An excess of rank yard manure very rich in nitrogen, or large applications of wood ashes in the hill, will give rough, watery potatoes. Nitrogenous manures, in whatever form applied, will deepen the green of potato vines, and if used in large amounts will give a watery potato. The color of the vine will, however, vary with each grade of fertilizer used, potash salts giving a light-colored vine.

The three farms that have been under my care have all been heavy clay-loams, and two of them were so heavy and moist as to be by nature unfitted to produce the very best potato. A heavy use of rank yard manure only aggravated the evil, and gave, in a wet, hot season, a scabby, watery potato just good enough to arouse the indignation of the hog. Chemical fertilization has given better potatoes on such soil than yard manure by a very decided difference, potash salts playing a very important part. In the use of these salts, I have had to meet the old notion that sulphate of potash gives a better potato than muriate of potash. I have seen no decisive evidence of this fact, and now I buy the muriate of potash because of its greater economy. Several experimenters have lately tested the influence of the form of potash salts, and have not reported any marked difference in the results of the use of either. That potash salts have a very direct relation to the organization of starch in the plant is well known.

In securing a good potato that will stand above the average, from a clayey soil, I have found that a clover stubble gives a most admirable basis, filled with roots that would weigh, with their stubble, two to three tons or more per acre. The soil on sowing is laid up very light and accessible to air. This seed-bed, if plowed deep, opens up a fine area for the rather deep roots of the potato, and gives a mellow soil for the tuber to nestle in. The roots in their decay, furnish all the nitrogen the potato needs, but not in excessive amounts at any one time, increasing with the rising sun and the expanding roots of the potato. Upon this ground superphosphate, or some source of phosphoric acid and ashes or muriate of potash are sown broadcast. I must confess to the use of about one-third of the fertilizers applied in the drill. This use of chemicals is not quite in accord with the teachings of some: yet for corn when it was all used in the drill in large amounts, as good results were received. Potatoes handled as above and well tilled to restrain the weeds and their sickly shade, will give a good potato even on such non-typical soils as I have alluded to. A big yield is secured also.

Selection of the potato will doubtless have a marked influence on the quality of the product. The form, color and density of the potato are to be taken prominently into consideration. No one wants deep-eyed potatoes, or rough ones, and all desire a good-sized eating potato. Efficient selection of the potato can be best secured in the field when the tubers are dug, for the type of the vine and the average character of the hill are then under observation. Dr. Sturtevant has illustrated the advantage of such selection by experimental tests at the New York Experiment Station, showing that the yield was thus increased, and whenever quantity is involved by selection, generally, quality is likewise at stake. For quality we select medium-sized potatoes in preference to large ones. Foreign trials have shown that dense potatoes, used for seed, determine a dense product as the result. This matter of selection of the potato with reference to quality has not received much attention, and hence emphatic data are not plentiful. It is a field that may well be entered.

In my use of chemicals I have found that nitrogenous fertilizers have but little influence on the growth of the potato, for the soil used; that chemicals are profitable for potato growth, and that whole medium and large potatoes give much larger crops than small ones, and single eyes. The results were stated for 7 years of consecutive trials, and 10 years of observation, and leave me without a doubt that the use of single eyes and of small potatoes for seed is a pernicious practice.

Missouri.

MICHIGAN POTATO GROWING.

A. C. GLIDDEN.

BUT little attention has been paid to potato growing, as a rule, by the farmers of our State. The Grand Traverse region, from its earliest settlement, has had an enviable reputation for the quality of its potatoes; but they were, and are still, grown with little regard to correct ideas of culture, as practiced in the older States, as illustrated and explained in the RURAL. The average farmer of the older portions of our State aims to grow only sufficient for home use, or, if the season should be unusually propitious and favorable for their growth, he may attempt to supply the local demands. Potato growing for the general markets is left to those localities where soil and transportation facilities both unite to make their culture a profitable and safe venture. There are several such localities in this State, and their soil is invariably a sandy loam made rich by clover and manure. Farms that have been worked for 50 years, if kept in good condition through rotation, with clover as a frequent crop, seem best adapted to growing a crop free from scab or rust and rot, and of that solid texture which stands up under transportation and storage.

In St. Joseph County, in this State, in the vicinity of Moorpark, Parkville and Flowerfield lies the largest potato-growing region of the State. Here is also the largest peppermint district of the United States, these two crops being the chief or staple ones grown by its farmers. From five to forty acres of potatoes per farm are here grown, and their experience has demonstrated what for them and their soil are the best methods. The basis of every crop is a good clover sod, on which is spread every available load of barn-yard manure, which is plowed under. The potato crop is followed usually with oats the next year, and seeded with clover, to go into potatoes again at the end of two years from seeding. This rotation frees the land of weeds, and makes the cultivation less expensive. The sod is turned to a moderate depth early in Spring and thoroughly prepared. The outcome of the crop is largely due to this cultivation before planting. It seems quite essential that the soil should be thoroughly fined, so

that the seed-pieces may start vigorously, and the roots be able to sustain the plant, when the starch food of the seed potato is exhausted. Here is believed to be the true secret of success. If the soil is lumpy, raw, as when freshly turned, the rootlets find little sustenance to sustain the young plant. A feeble plant insures a small yield with few marketable potatoes. After a thorough preparation, the ground is marked out from three feet to three feet two inches apart each way. The three feet two inches are to allow more latitude for working the crop with a two-horse cultivator. The question as to the amount of seed per hill has been largely discussed and many experiments have been made to determine the matter. One of the largest growers informs me that he cuts his potatoes in pieces of nearly uniform size, having from one to two eyes on a piece, and puts but one piece in a hill. One eye is sufficient if the piece is large enough, as small pieces with many eyes make poor seed. One eye will often make two or more stalks. If the sets which form on the roots of one vigorous stalk, all make large potatoes, the yield of marketable potatoes will be much larger than a numerous progeny of equal bulk. Soil of a given quality will grow about so much bulk of tuber. If an attempt is made to induce a large yield by too large a quantity of seed, the result must be many small potatoes. In other words, if eight potatoes are grown to the hill, none of which are under four ounces in weight, every potato will be marketable, while if 16 are formed in the same hill many of these must be too small for table. In a field marked three feet each way, eight potatoes to the hill, of only four ounces in weight each, will give a yield of 161 bushels of marketable potatoes to the acre. This is a moderate estimate when it is considered that a potato of four ounces, is about as small as will answer for market or table.

The potatoes used for seed are of moderate size, small potatoes giving too small a bulk to the eye to be profitable or suitable for seed. The Burbank is now the standard relied upon for market. It is of good shape and color; its season of growth about the right length to perfect the crop, and give time for the harvest and marketing before frosty weather begins, and, above all, it stands up better under storage and shipment than most other sorts. Early Rose is liable to be streaked with red through the flesh, and shippers and consumers are very chary about handling stock that may rot down on their hands.

The crop ranges from 125 to 200 bushels per acre, and for the past 10 years has been the best paying crop grown on the farms. The crop this year has brought about 34 cents net, where the grower has shipped or consigned on his own account, which, for the labor required to produce, is as good as any of the farm crops have done. It does not pay to attempt to grow potatoes following corn, or on stubble ground, unless the soil is exceptionally good. They need the first and best nourishment which a well-prepared soil can furnish. This is a fact which half the farmers in almost every agricultural community need to learn. The family potato patch is usually the last location to be decided upon in the annual planning for the farm crops, and it usually occupies some neglected corner, foul with weeds, and is ill-fitted for the seed. Many farmers still believe that it injures the crop to stir the ground after sets are formed. This is one of the many delusions which have no excuse for existence, except that dignity which age imparts. This loyalty to ancestral ideas often prevents us from destroying the autumnal crop of weeds; and from giving that stirring of the ground, which keeps it fresh and lively. Such a state is very essential to perfect and mature a crop, when the hot sun and rank weeds are likely to rob the soil of every vestige of moisture, and ruin the crop prematurely. Every principle which is applicable to the successful growth of large fields of potatoes, applies with equal force to the family patch; but to the large growers we must look for advancement in the ways and means of successful potato growing.

Paw Paw, Mich.

CULTURE OF IRISH POTATOES.—HOW BEST YIELDS ARE SECURED.

B. F. JOHNSON.

THE best varieties for Central Illinois are at present confined to two; the Early Ohio and Late Peachblow. In my experience the Burbank, the Chicago Market, the White Star, and a dozen others, are none of them either early or late, and none of them better than second-rate. The Early Rose was the earliest and best for ten years or more, then followed the Late Rose; but now the first has degenerated to the eye, and is of the shape of a man's finger, and the Late has been merged into other kinds till its distinctive features have been lost. The Peachblow is fast going where all varieties go, and will disappear from cultivation in a few years. The two varieties named are the most profitable for cultivation, because they yield large crops of good table potatoes, which consumers have come to know and appreciate.

The best soil is a Timothy, or Blue Grass sod, broken in the Autumn. The next best is common black soil corn land, reinforced by old stable manure and coal and wood ashes. I have grown potatoes on the same land for years, and the crops have increased rather than diminished in quality and quantity, though varying, of course, with the season—heavy crops in cool, moist Summers, light, in hot and dry. The implements used are, for small patches, the plow, the cultivator, and the hoe; for large, common corn crop tools.

They are commonly planted in rows from three to three-and-a-half feet apart, one piece of one or two eyes, being dropped every 15 to 18 inches. Time of planting from the middle of April to middle of May. Some practice cutting the seed in March, allowing the raw surface "to heal," then the sets to sprout, and plant after sprouting, taking care, in handling, not to break the sprouts. The preferable tubers for seed are found to be those of good size, cut to not more than three, nor less than two eyes to the set.

The common fertilizer is barn-yard manure, a very few only using fertilizers, and these the potash in preference to the phosphate. Potash fertilizer seems to increase size, favors good form, deepens color, enlarges yield and hightens quality, by producing a large relative amount of starch.

Hilling up is almost universally practiced, because it is difficult to subdue the weeds in any other way; besides, it assists in carrying off the heavy rains from the hills, on the occasions, not infrequent, when three or four inches fall in as many hours.

Blight or mildew (Peronospora) appears more or less on the vines every year, but there has been no general or widespread potato rot since 1865—a Summer remarkable for its excessive rain, heat and humidity. To be sure we occasionally hear of potato rot; but it is confined to narrow areas, where low, moist land and heavy green manuring have been the exciting causes. It is a common experience where crops have been grown year after year on the same land, and the Colorado Beetle has been fought for several seasons with Paris-green, that rot rarely makes its appearance in the tubers, though the presence of more or less mildew on the vines is usual.

It is my belief that copper in the soil, derived from the previous liberal use of Paris-green to kill the potato beetle, destroys the germs that cause the potato rot; in the same way, a one-per-cent. solution of sulphate of copper in water (four pounds to the 50 gallons) has been found effective to arrest the progress of mildew on the foliage and to prevent the rot of the fruit in the wine districts of Continental Europe.

Last year I had a small patch of Early Ohios exposed to conditions of soil and weather thought to favor mildew and rot both, but there was absolutely none of the latter, and only enough of the former to be able to say it was there. The land is common, deep, black soil 25 years in cultivation, and at least a dozen crops of potatoes had been grown on it, and four previously in succession. Previous to the crops of the last two years, the land had been treated to fully four inches of strawy stable manure spread over the surface and plowed in. A potash and phosphate fertilizer had been applied the year before and a pint of ashes given each hill. The piece was planted about the middle of April, with Early Ohio. The stand proved good and the growth was favorable. About the middle of July the weather became tropical, the rains were excessive, the thunder storms nearly continuous and the heat night and day was fearful. This lasted for more than two weeks and potato rot was much talked of and feared. And yet, under all these adverse conditions I never raised better potatoes. They were sound, smooth and large, solid, well colored and starchy, and the total crop was remarkable for the limited number of small potatoes. This exemption from rot I attribute largely to the amount of copper in the soil, the previous dozen crops or more having been treated to at least three dustings of Paris-green extended in plaster, each Summer. I conclude the soil of this piece for the first foot down from the surface, contains at least the fourth of an ounce of the salt of copper, and possibly twice as much.

I dwell on this point because I think a preventive of potato mildew and rot and grape mildew and rot is to be found in sprinkling foliage and fruit with a one-per-cent. solution of sulphate of copper (bluestone) in water early in June, and again once or twice during the growing season. I am quite confident too, potato rot will not be found to be common where Paris-green has been used for two or three years in succession, and also that the treatment of the vines of a given crop with Paris-green two or three times in the growing season will prove a preventive to a measurable extent.

I have given so much space to mildew and rot, I have little space for other sides of the subject. As to harvesting, for small patches, the spading fork is used, and for large, a potato plow of which there are several forms. After 25 years' experience, I am in favor of leaving potatoes in the ground to the latest safe hour, say the first week in November, and this even for those maturing early in July. The average yield for the country is not above 100 bushels, though in favorable years 200 bushels are sometimes made. For an early potato, the Early Ohio comes very near the ideal of a perfect potato; and for a late one, the Jersey Peachblow, if it could get a new lease of life, and bring its eyes to the surface like the Rose.

Champaign, Ills.

POTATOES.

T. B. TERRY.

WHAT improvement there has been in potato planting since I first began farming; 16 years ago! Then we marked out with a plow, dropped four times as much seed as was necessary, and did it by hand. The covering also was done by hand; with a hoe, at first, although we soon learned to cover by horse-power. There was a good deal of hard work connected with potato culture in those days; but now one can avoid most of this. Where the growing of potatoes is made a specialty, they can be raised for half the price per bushel that it cost 15 years ago, if one is fully supplied with all the labor-saving tools and equipments.

Last year, and the year before, I sat on my Aspinwall planter and put in my entire crop (24 acres one year, and 18 the other), without any help, at the rate of an acre in two hours. The seed was cut to one eye, and put in the hopper, after which the machine did all the work of opening a furrow, dropping the seed and covering, while passing over the ground once. It fails to drop once in 30 or 40 times, and a little oftener drops two eyes instead of one; but where the seed is drilled in, an eye once in about 12 inches, the loss from failure to drop is very slight. The dropping of two eyes instead of one, is a slight loss of seed, but hardly worth speaking about. The marking out and covering are perfect. The rows can be made almost perfectly straight, which is of great importance when you come to use cultivator and horse hoe, as you can run close to the plants, on both sides at once, instead of having to go through twice, as we did years ago.

Of course, when seed is cut to one eye, the tubers should be of fair size; and they should have been so wintered as to be in good condition, with no eyes any more than just started. (If you break off the first sprout, the next one will be weaker.) Then the soil should be fertile, and the seed-bed finely pulverized, and the planting done as soon as possible after the seed is cut. Treated in this way, one eye dropped once in 12 or 13 inches in drill, gives better results, with me, than two or three. The crop is of more uniform marketable size, and whenever I have experimented, the rows planted with one eye sets have yielded the most dollars to the acre, although not the most tubers in number; but we want to raise dollars, not little potatoes for the pigs. When many acres are planted, the saving of seed is quite an important matter. With me it takes about eight bushels of good-sized potatoes to plant an acre. The drills are made 32 inches apart, for such varieties as we raise, Beauty of Hebron, Clark's No. 1, etc.

We like to have them close enough so the ground will be entirely covered and shaded from the sun during the last part of their growth. The depth of planting must, of course, be governed by the depth of the soil, whether drained or not, whether it is very dry or moist, etc., etc. Our rule is to plant about half as deep as we plow. Our drained potato land has been plowed deeper and deeper, gradually, until the plow often runs now between nine and ten inches deep. Then we plant about 4½ inches below the surface, and then do not hill up much. With us the greatest enemy of the crop has been drought, and a deep, mellow soil with the seed planted moderately deep and the surface kept constantly stirred after planting, helps us very much in warding off the attacks of this enemy.

If we plant at different times, we never can tell beforehand, to a certainty, which piece will yield best, as the weather has so much to do with the result. Some years early planting pays best, and again, late planting comes out ahead. After long experience, I prefer to take the chances of early planting; that is, of planting as soon as the ground is dry enough to be worked without injury. Once or twice I have missed it by so doing; but, then, again, I have cleared over $100 an acre. One thing do by all means: when you have decided on a course, stick to it through thick and thin. Do not change. If you lost by early planting last year, "look for your money where you lost it." If you plant late next year, you may change just in time to lose again. It is but little use for us in Northern Ohio to try to get potatoes ready for the early market, when they bring a high price, as our markets, as a general rule, are filled with potatoes from the South long before we can get any ready to dig. Ten years ago we used to get a large price for the first dug, but we can seldom do so now.

This planting by machinery has more advantages than one would think of at first. When potatoes are grown largely, of course it is money that would have to be paid for extra help to do the dropping. You do not have to run after help. You are quite independent. In a catching time you can rush in a large quantity in a day. The machine never gets the back-ache. It makes your house more of a home and less of a boarding house, by enabling you to get along without extra hired help for your family to wait on. For this last reason alone I would pay the interest on the cost of planter. The farmer's home should be made as pleasant, and the good wife saved as much labor as possible.

Summit Co., Ohio

POTATOES.

ONLY the early kinds of potatoes are certain to yield a crop in this section. Our Summers are too dry and hot for the late kinds, though they do well about once in five years. I have tried several kinds, and have finally settled on Early Ohio and Beauty of Hebron as the best yielders, best keepers and best in quality. Of the two, Early Ohio yields somewhat the larger crop, but is the most liable to rot. We have grown some large crops of both kinds on corn land that was manured with fine farm-yard manure the previous Autumn. Large crops are also grown on clover sod, but a large percentage of the tubers will be scabby. We plant in furrows two to three inches deep, as early in the Spring as the land can be properly worked, and cover with two or three inches of soil. Harrow just before the plants appear, cultivate two or three times with a corn cultivator, working the earth toward the plants, and hoe once or twice. Kill beetles with London-purple in water.

The potatoes are allowed to remain in the ground until cool weather sets in, unless we have a wet Fall. In that case we are obliged to dig them to prevent a second growth. They are stored in a cool, dry place until Winter, when they are placed in a cellar or pits. In cellars the bins should not be over six inches deep. Pits are best 15 to 25 inches wide, six inches deep, and as long as needed. They must be in a dry location. Potatoes in pits are covered with about four inches of straw and 12 to 15 inches of earth.

When stored as above indicated, we have lost very few by rot. I know of no way of entirely preventing scab. It seems to be caused by worms supplemented by a fungus. Potato beetles have done but little injury the past five or six years. They are easily kept in subjection by the use of arsenites if promptly applied.

FRED GRUNDY.

Christian Co., Ills.

MR. ALFRED ROSE'S VIEWS.

MY mode of culture for potatoes is in substance, as follows: For the best results, a rich, sandy-loam soil is needed with a clover sod, turned under, ten inches in the Fall, with ten cords of rotted stable manure spread evenly on each acre. In the Spring it is plowed as deep as possible and harrowed deeply and thoroughly both ways; rows are marked three feet apart for large-growing vines; for small vines, 34 inches apart. Trenches are then opened with a one-horse plow, eight inches deep, going through twice with the plow in each row. Then I pass through with a hoe and grade the trenches to about 6½ inches deep. It is now ready for planting, except manuring in the trenches at the time of planting. The best early potatoes for the table are, first, Rocky Mountain Rose, Early Sunrise and Early Electric and with me those are ripe for the table from the first to the tenth of July. Second come Early Vanguard, Early Ohio and Early Prolific and Rose's Beauty of Beauties.

As for seed for planting, my choice is the size of a hen's egg or four tubers to the pound, and all should be of fine shape, and be selected when first dug, put in barrels and stored in the cellar. Ill-shaped tubers never should be planted, for often "like begets like." My seed is cut to single eyes with a concave and curved knife. If too many eyes are

on the seed ends to suit me, I do not use them. If I wish two stalks to the hill, and a full stand with no hills missing, for a large yield per acre, my seed is cut four to five weeks before planting, dusted well with plaster, spread on boards in my cellar and stirred over often, to keep from heating. When ready to plant, I discard all that are not sprouted. This gives me a full stand and much earlier potatoes. When cut to two eyes and planted, there will be many hills with only one stalk, owing to one of the buds getting the start and keeping the other dormant, and this may shorten the crop (planting as I do), fully 50 bushels to the acre.

The ground and seed are now in fine condition for planting. If two stalks are required, I drop two pieces with one eye each, 10 to 12 inches apart in the trench, the difference being due to tall and short-growing varieties. If a large variety, sometimes I only drop pieces with one eye nine to ten inches apart. The sets are now covered with a hoe, two inches deep, and the remainder of the trench is eft open, and for an extra yield, I now scatter in the trenches 500 to 600 pounds of Mapes' potato manure, or Stockbridge's, etc., all mixed with plaster, cultivating and filling up the trench as the vines grow. My rule is after this to cultivate and hoe three times each, and cultivate each time twice in the row. After this I cultivate and hill up with a hiller. By this mode of culture I have grown 417 bushels on one-half acre, and last season, with my new seedlings, I did much better. The profit in growing potatoes is in the yield, as it costs about $40 to grow 125 bushels on one acre. If sold at 50 cents per bushel, the profit would be $22.50. With a cost of $80 per acre and a common yield of 500 bushels to the acre, sale at 50 cents per bushel would give a profit of $170 per acre, and the cost per bushel would be 16 cents.

The cause of blight is principally in the weather—hot streaks of air and wind after heavy rains—and it shows itself mostly in certain stages of the vine growth, from the 20th of July to the latter part of August. Hot thunder storms followed by strong, hot, sultry winds, and too much warm rain are the causes of the rot also. Last season I had two rows of potatoes 25 rods long, between my grape rows. One day the vines were all green and beautiful, no signs of blight; then followed a heavy thunder shower; next day but one all were blighted, the leaves being nearly all black. Six rods from these, some of the same variety, both planted the same day, the rows of the same length and running parallel, were not injured in the least. So I think hot streaks of wind are one cause of blight. Another is a rank growth of vines covering all the ground, and then when there is a heavy warm rain, the steam from the ground, passing up through the vines, blights them and also rots the potatoes. For this, and to avoid sun-burnt potatoes, I like hilling up, and then the tubers are, with me, much easier to dig. As a matter of fact, in this section last season, in the case of all shallow-planted potatoes, the tubers nearest the surface nearly all rotted, especially the large ones. To avoid the scab caused by the Thousand-legged Wire-worm, I have used kainit—600 pounds to the acre—broadcasted in the Fall on scabby potato ground with good success, as the following season there was scarcely a scabby potato to be found; but, salt and sulphur mixed and put in the hill will be a preventive of scab also.

Twenty years since I had a field of Quack Grass, and it was chock-full of the long wire-worms then in sod. I made a fertilizer of unleached ashes, salt and lime: before slaking the lime, I put on it 20 pounds of sulphur and slaked them together with boiling water: then mixed all well together, using a large handful of the mixture to each hill, of all but one row. In this row at digging time, the tubers were eaten through and through, and the wire-worms were then in the tubers. Where the mixture was in the hills, the tubers were all smooth, clean and handsome. I have made and used a fertilizer for potatoes by taking, say, 100 pounds of bone dust, one sack of coarse salt and 50 pounds of muriate of potash, all well mixed together, applying the same in the trenches. For top-dressing also, this is one of the best. Stable manure comes first, then Mapes and the one noticed here, to be used in trenches in connection with stable manure in the manner before stated.

My potatoes are dug with forks, as I like this mode best. One man can and does dig and pick up 80 bushels in one day, if the yield is good. In picking, the small ones are sorted from the others, and the latter are put in piles of 40 to 100 bushels each, covered and shingled over with potato stalks, with the roots evenly up, with air holes for the gas to escape while they are sweating. They are left here five to eight weeks; then sorted again closely, then put in the cellar on a sandy loam bottom, sprinkled with lime as each load is put in. They are put in bins of 200 to 300 bushels each, each five feet deep and five feet wide. They are then kept in the dark, and none has ever rotted, all being sound in the Spring.

In marketing potatoes for the table, I first consult the RURAL NEW-YORKER, and read the evidence from its patrons. If from the evidence, I find there is generally throughout the country a large crop, I should say, sell in the Fall, and save the shrinkage, which is more than many are aware of. My rule is to lift the potatoes as soon as ripe, and before the vines are quite dead. The tubers are now clean and will dry quickly, and keep better, the risk of rot will be less, and the lady of the house will like them better. Small potatoes are boiled and fed to chickens.

My ideal potato for the table is one that weighs six ounces or three tubers to the pound, as in tubers of this size, the grain is finer and the flavor more delicate than in one of the same variety weighing one to one-and-a-half pound. Color of skin yellowish-white and russeted; or the skin may be of a rose color; but both must have pure white flesh of a fine grain and delicate flavor; eyes flat on the surface; shape of tuber, oblong or oval to oblong.

To improve a worn-out variety of potato, first sort out the small tubers of the genuine shape of the original; cut off one-third of the seed end, this is not to be used. Cut the stem end to single eyes, and plant the same. Do the same with its product the following season. This will certainly improve the potato up to its original standard. The disposition of some varieties is to grow too large if planted the old way. Such I plant closer until I find the size I wish.

Seven years since, a friend sent me a wild potato. I planted it—then the size of a large pea—the growth was one small tuber of the same size. I planted this the second season, and grew one tuber, the size of a large pear. From this time on, the product grew in size, and the sixth season I had nine tubers, and last season I grew nearly two bushels, all of good size, a quarter to one pound each, smooth and handsome.

Proper climatic conditions are very essential for growing good potatoes. They should have an even temperature of about 85 degrees, with no hot flashes of wind in certain stages of growth: also rain sufficient at times to keep the soil moist. In some of our hottest, dry seasons, I have noticed that the yield of potatoes growing on a hill sloping to the north, was much better than from those on land sloping south. I have also often found, while digging, tubers with color and eyes the opposite of those planted. I have also cut all the eyes out of a White Star Potato and inserted a one-eye piece from a red potato, and it grew white-skinned potatoes with pink eyes; and the following season the same. The average yield of potatoes in this section is 125 to 150 bushels to the acre. Some of our best growers get from 300 to 400 bushels to the acre, and many farmers about here last season lost all their potatoes by the rot—whole fields of five to twenty acres each. The market for good potatoes is improving materially, and will no doubt continue to do so.

For the potato bug I first mix 10 pounds of Paris-green with 1,000 pounds of fine plaster, thoroughly through and through. As soon as the young beetles appear, with a fine sieve duster I dust the vines lightly with the mixture and again when a new batch appears. This kills all at once.

For the squash grub borer I dissolve two ounces of saltpeter in 1½ gallon of water, and use it freely around the stems and roots, commencing soon after the plants are up, using it at intervals of four or five days: this saves the vine from the borer. For the streaked bug I use soot blown with bellows on both sides of the leaves and around the stem, when moist with dew or rain; I also use the same on cabbage plants, for the turnip fly. This is a sure remedy for both. For the cabbage worm I use finely-ground black pepper and finely-ground salt mixed (also some plaster to increase the bulk). This is dusted on with a fine wire sifter when the dew is on, and it kills the worms at once, and will kill the currant worm.

Yates Co., N. Y.

POTATOES AS A FIELD CROP.

WALDO F. BROWN.

I HAVE always liked to grow potatoes because of the possibilities of the crop; for while, even in seasons like that just past, when the price goes down to from 30 to 40 cents a bushel, the crop will pay better than corn, in years when prices and yield are both good, they are a very profitable crop. From the last census of the United States I find that for the last ten years the crop in the entire country averaged 87 bushels to the acre, and that the average cash value per acre of the crop for the ten years was $47.68. The highest average cash value per acre was $58.83, and the lowest, $41.14. The lowest average price per bushel during the ten years was 39 cents, when the average per acre reached 111 bushels, and the highest price 91 cents, when the average dropped to 57 bushels per acre. During the same period the average value of the wheat crop of the United States was $12.82, and of the corn $11.20, so it is seen that potatoes brought nearly four times as much per acre as wheat, and more than four times as much as corn. It is difficult to recommend varieties so that the recommendation can be of any value to the readers of a paper with so wide a circulation as the RURAL; for climate, soil, and the demands of the local market must all be considered; but two things the intelligent potato grower must do; first, plant only tested varieties for the main crop, and, second, be continually testing new varieties to find what is best for him.

I have not found any one variety better than all others: but all of the following have been profitable on my land: Early Rose, Early Sunrise, Early Ohio, Rural Blush, Wall's Orange, Victor, Burbank, Conqueror, Beauty of Hebron, and White Elephant. For two years past I have also found the White Peachblow very profitable, although for many years most growers have discarded it. For the main crop, I select for seed medium-sized tubers, and reject all that are misshapen or defective in any way. I like to have the seed run nearly the size of a hen's egg, and do not use small seed, unless potatoes are very scarce and high-priced. I always select my seed at the time of digging, for when the potatoes are freshly dug they are bright, and it is easy to detect any admixture. I prefer keeping the seed potatoes in pits, as they neither sprout nor wilt when wintered in this way, which they are likely to do in the cellar. I consider it of great importance that the seed at the time of planting should be sound and plump.

To insure a profitable crop, there are three points in the soil which are essential: 1st, it must be well drained; 2d, it should be rich, and, 3d, it ought to be clean. A profitable crop can be grown on land full of foul weeds, but it will be with great labor and vexation. The crop also may be profitable on only moderately rich land, if the cultivation is extra thorough; but if it is a soil that becomes saturated with water, neither manure nor extra cultivation will count for anything in a wet season. A clover sod gives a good—probably the best—seed-bed. The preparation of the soil should be thorough. I doubt if one farmer in ten puts as much labor on his potato land before planting as would be profitable. What implements to use depends somewhat on the soil and the season; but the surface should be made fine by use of drag or roller, and it should be thoroughly mellowed at least six inches deep, by the use of a harrow, that will cut down like the "Disk" or Acme harrows. I have for several years used the Disk harrow, and find it does the work to perfection. For the early crop I prefer to plow in the Fall in lands about 16 feet wide, with the dead furrows running with the slope of the land. We clean out all the loose earth from these furrows and use them as surface drains to carry off the water. Land left in this shape will pulverize finely in the Spring, and can be planted early.

I have always planted by hand and expect to continue to do so, as I think it can be done better than by machinery, and as the covering is done by horse power, it is not expensive, and unless one is very largely in the business, it will not pay to invest the money and be at the trouble of storing a machine for one or two days' work in a year. I never plant whole potatoes, but cut seed of the size named above into from four to six pieces, so as to have not less than two eyes to a piece, and plant one in a hill. The distance apart should vary with varieties. The early kinds, which make a small growth of top, may be planted with the rows 2½ feet apart and the hills 15 inches, which will give nearly 14,000 hills to the acre, while some of the rank-growing kinds should be planted three by two feet, which gives 7,260 hills per acre. I always plant deep and lay off the ground with a long, narrow shovel-plow or bull-tongue, which runs as deep as the land is plowed, and leaves plenty of loose earth in the bottom of the furrow; and I make it a rule that the dropper must step on each piece of the seed, to press it down into the bottom of the furrow. We cover with the horse, and the condition of the soil determines what implement to use—sometimes a heavy plank drag with two horses, drawn across the rows, with which two or three acres an hour can be covered; sometimes the two-horse harrow, and again, the corn cultivator; but always some implement with the horse and by which rapid and good work can be done.

In a large majority of cases, and with most varieties, early planting will give the best

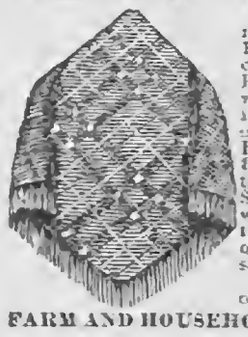
Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

PLAID SHAWL GIVEN AWAY!



Through the failure of a large manufacturer of Cashmere Pattern Fringe Shawls, there has come into our hands a large consignment of Plaid Shawls, perfect goods, which we propose to present to the ladies in the following manner: Send us 25 cents for 3 mos. subscription to **Farm and Household**, a large **32 page** illustrated paper, devoted to Farm and Household topics, Stories and general miscellany, and we will send you one of these **beautiful shawls FREE** by mail postpaid, or we will send 5 shawls and 5 subscriptions to one address for $1.00

Satisfaction guaranteed or money refunded. Address

FARM AND HOUSEHOLD, Box 49, Hartford, Conn.

SEDGWICK STEEL WIRE FENCE

Is the best general purpose wire fence in use. It is a **strong net-work without barbs.** Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is **better than boards or barbed wire** in every respect. The **Sedgwick Gates** made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working **all-iron automatic or self-opening gate,** and the **neatest cheap iron fences now made.** The **best Wire Stretchers, Cutting Pliers** and **Post Augers.** For prices and particulars ask Hardware Dealers, or address, mentioning paper,

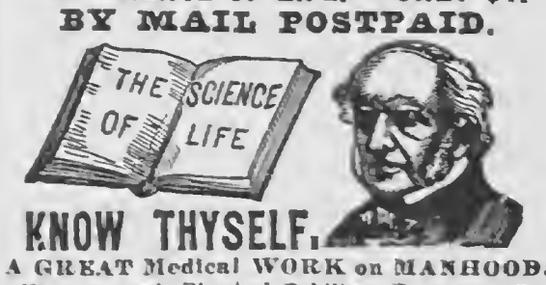
THE SCIENCE OF LIFE. ONLY $1.
BY MAIL POSTPAID.



KNOW THYSELF.

A GREAT Medical WORK on MANHOOD.

Nervous and Physical Debility, Premature Decline in man. A book for every man, young, middle-aged and old. It contains 125 prescriptions for all acute and chronic diseases, each one of which is invaluable. So found by the author, whose experience for 23 years in such has probably never before fell to the lot of any physician. 300 pages, bound in beautiful French muslin, embossed covers, full gilt, guaranteed to be a finer work in every sense—mechanical, literary and professional—than any other work sold in this country for $2.50, or the money will be refunded in every instance. Price only $1.00 by mail, postpaid. Illustrated sample 6 cents. Send now. Gold medal awarded the author by the National Medical Association, to the officers of which he refers.

The Science of Life should be read by the young for instruction, and by the afflicted for relief. It will benefit all.—*London Lancet.*

There is no member of society to whom The Science of Life will not be useful, whether youth, parent, guardian, instructor or clergyman.—*Argonaut.*

Address the Peabody Medical Institute, or Dr. W. H. Parker, No. 4 Bulfinch Street, Boston, Mass., who may be consulted on all diseases requiring skill and experience. Chronic and obstinate diseases that have baffled the skill of all other physicians a specialty. Such treated successfully without an instance of failure.

POTATO SPECIAL THIS WEEK—20 PAGES.

WE cannot in these days afford to plant potatoes with deep eyes, either for home use or market.

THE Domestic Economy Department of the RURAL this week contributes its appropriate share of potato information.

NOTE.

A VERY annoying blunder occured in last week's RURAL. Page 21 should have been page 20 and *vice versa*, and should be read accordingly.

THE promised Potato Special is before our readers. The second Potato Special will appear as announced. There is one grave objection to Specials, viz., that they put everything else behind.

OUR reports of tests of new varieties of potatoes will continue until planting time. We are now reporting the trials of the eighth year, during which we have tested the new potatoes of those years, varying in number from 50 to 125.

THE Century for January contains an account of the RURAL's hybrid rye-wheat plants from the pen of Charles Barnard. The article neglects to state whether these hybrid plants are growing in the Eastern or Western Hemisphere, or in the moon, or where the hybridization was effected.

DURING the past six years we have grown 480 different varieties of potatoes at the Rural Grounds, many of which have been illustrated in these columns (from nature), and most of which have been reported upon as to yield, shape and quality. We give an epitome of these reports on page 45.

OUR subscribers are respectfully solicited to renew as soon as, or before their subscriptions expire, since, owing to the fact that our calls for specimen copies are far greater than in any preceding year, we can not supply back numbers later than the first of February, probably.

THROUGH inadvertance in a previous announcement, we mentioned the Baltimore Herald as one of the papers of our Special Clubbing Arrangement. This was an error. It is the weekly edition of the Morning Herald with which we club. Letters for specimen copies should be addressed "Morning Herald, Baltimore, Md."

TWO years ago the RURAL effected hybridization between the so-called Strawberry Tomato (Alkekengi) and the potato—the latter being the female parent. The seed was sown in the house last February, and produced one plant which was set in the garden in late May. It grew thriftily, resembled the potato in stems and leaves, but bore neither tomatoes above ground nor the faintest indication of a tuber beneath

WE beg to say that the illustrations of new potatoes presented in these columns are really portraits of the average or typical size and shape of the variety illustrated. The specimens are selected with a view to show the prevailing characteristics. The illustrations of the average catalogue are *not* true portraits, and most of them will answer as well for one kind as for another. Faithful illustrations in rural books or periodicals are as rare as they are valuable.

WE have at this time, at the Rural Grounds, potatoes some of which are all purple, some streaked, some white or buff, all grown from the same tuber three years ago. The original tuber was half purple, half buff or white. The purple eyes, and white eyes, were planted separately, and selections made from year to year according to color. The originators of new varieties should commence with a single tuber and propagate from it and not select several from the same hill, if they would grow varieties uniform in every way.

LET us say to all that the RURAL of November 14th, 1885, gives a full, illustrated description of our Free Seed Distribution, together with a full list of the $3,300 worth of presents to be sent to subscribers (and to them only) who secure clubs for the RURAL NEW-YORKER. This Number is sent to ALL who apply for specimens, and it should be not only read, but carefully preserved.

As our older readers are aware, potatoes have been raised from seed at the Rural Grounds for a number of years. Until the past season, however, it has not appeared that any of them were better than the best of those already in the market. We have now a variety that promises to meet our hopes. The tubers average large. The skin is white, smooth and the eyes few and superficial. The quality is certainly of the best, if we may judge from the few tubers eaten. The yield in our garden soil was at the rate of 700 bushels to the acre. It will probably prove to be a rather late potato. Of the hundreds of new potatoes tested at the Rural Grounds, there is scarcely one that combines all the excellencies of a perfect potato, viz., form, quality, productiveness and keeping properties.

OUR Broadway contemporary speaks of another new quince which is to be called after its associate editor, the "Fuller"—not because it originated with him, but merely because the person on whose farm it *did* originate, gave him cuttings which he propagated and now proposes to sell, the original tree having been destroyed by mechanics while erecting a building. It is to be hoped that Associate-Editor Fuller will reconsider this. An originator, without question, has a full right to bestow upon his new plant any name he may choose; but for anyone to hitch his own name to a new fruit with the originating of which he had nothing in the world to do except in an accidental way, gives one of those distinctions from which all fair-minded pomologists would shrink. The Meech's Prolific Quince offers another example in which a puerile vanity has been permitted to override a sense of justice and honor.

REFERRING to Dr. Caldwell's article in this number, it may be said that the cause of what is called "scab" at the Rural Grounds has generally been the wire-worm (Iulus). While digging our potatoes as they matured last season, every scabby tuber was examined. Many hills were dug during various stages of growth. In a few cases the "blister" often referred to by RURAL correspondents, was noticed. This kind of scab may be caused by a fungus. It is very plain that scab has for its origin more than one cause. To repel the wire-worm we have tried all sorts of chemical fertilizers, separately and together, as well as lime, salt, coal and wood ashes, but none proved *wholly* effectual. Flowers of sulphur, dusted about the seed pieces, was used last season. The tubers so raised were entirely free from scab. Several years ago we raised potatoes on a plot upon which a goodly quantity of leaves had been spaded under. The outer portions were a net-work of scab, and wire-worms of every size were found about them and embedded in the corrosions by thousands.

IT is well known to the older readers of the RURAL NEW-YORKER that the plot upon which our immense yields of potatoes have been produced, is well supplied with every kind of plant food which the potato needs, and that in abundance. This plot rarely suffers from drought—the great enemy of the potato—and, being well drained, it cannot suffer from too much water. For six or seven successive years we have raised potatoes upon it, and the average yield has increased each year. From 60 to 80 different new varieties are raised every season. As many of them are inferior in productiveness, the yield is proportionately reduced. Were we to select the most productive kinds suited to the soil and climate, we have no doubt we could raise at the rate of 800 bushels to the acre upon this carefully prepared plot. Whether it *pays* to prepare land in this way is a question we have not been able to decide.

IT is a lamentable fact that farmers' homes, as a class, are almost destitute of small fruits, while nothing so conduces to health and pleasure as their abundant and daily use. We feel earnestly the need of their more extended use. In no way can we do our readers a greater favor than by encouraging them in the growth and daily use of all kinds. It was with this end in view that we made arrangements with the originators, which make it possible for us to place seven or eight of the best kinds within the reach of all, without expense, save the needed exertion in placing the RURAL before their friends. We want every RURAL subscriber to avail himself of these offers, and we want all to care for the plants so that a single year will give them a plantation that will furnish an abundance for years. Look over the list on the next page, friends, and resolve to have not one kind only, but several. Any of these lots purchased and the freight charges paid, will cost you nearly, or quite, as much as the price of the RURAL, while we send them free of charge and guarantee them true; and yet how many will neglect to profit by this offer, and next Summer sincerely regret it!

STRANGER FRIENDS.

THOUSANDS of you are receiving this Number of the RURAL NEW-YORKER for examination, and we wish to call your attention to the complete manner in which we treat the specialty of potatoes and potato growing, and the character of the contributors and their articles. The RURAL is the only paper which enters this field of Special Numbers, and during the year it will take up from six to ten subjects and treat them in an equally exhaustive manner. Do you not see that the RURAL is occupying a broader and higher field in agricultural teaching, and is doing more to give the farmer a thorough knowledge of his business, which must lead to a better and more profitable system of farming, than any other journal, and is it not your duty, as well as your privilege, to support it in its noble mission by becoming one of its subscribers? We shall welcome you among its "grand army" of progressive readers.

POTATOES.

THE time was, long ago, when the potato was regarded as a luxury to be eaten only on grand occasions and by the rich. It is now a part of the daily food of the American people, and greatly to their health as well as enjoyment. Although it contains but a comparatively small nutrient value when compared with some other products, yet its constituents are in such proportion, and its use has such a salutary dietetic effect, that there is not an article so commonly used, but could be more easily dispensed with, and whose place it would be harder to fill. So that though thousands of our readers many never plant a potato, all are deeply interested in their growth and abundant supply at moderate prices, and should therefore not fail to read this Number, in which is contained more accurate knowledge on the potato and its culture, than is together in the same space, and in so plain and understandable a form, anywhere else in any language.

And yet the subject is not by any means exhausted. We have much more on this topic in such a valuable form, that it should not be lost to the world and we shall give it in another Potato Number, some time in February. No one should think, when through reading this Number, that he knows all about potato growing, for we assure our friends that some of the best points have been reserved for the subsequent Number. Wisdom always dictates the "keeping some of the best wine to the end of the feast."

AWAY WITH THE STUFF.

THE oleomargarine men are engaged in one of the most profitable branches of manufacture ever started in any country, viz: the conversion of the low-priced fats and grease of pork, beef and mutton, into what sells for, and takes the place of, the much more expensive and higher-priced article, "butter." Not only this; but they often use the lowest-priced and most filthy fats of dead and diseased animals, and of the spoiled carcasses of the market stalls; such refuse as has heretofore been used only for soap making; and such stuff even as the more conscientious makers of this very necessary commodity, like Frank Siddalls, Proctor & Gamble, and Williams Bros., will not use for this purpose, these fellows, by the aid of chemistry, convert into a counterfeit substitute for an article of every-day use by both rich and poor.

To this no one would object, were they to put it up, brand it with its true name, and sell it for just what it is. If the manufacturers can make an article which is preferable to poor butter, or even to the best gilt-edged butter, and people can be found whose tastes will induce them to buy and use such a product, we can only say good words for such an industry, and wish those engaged in it success, and we care not at what price they sell it.

If farmers are so indifferent that they will not so study their business as to be able to keep cows and make butter that will compete, in quality and price, with any compound of dead fats and chemicals; then let them go to the wall, and let their pastures be used for grazing sheep, goats and *asses* (themselves in such a case). But when this stuff, no matter how good it may be, is put up to imitate butter, and is sold as such, and at a price which, though extremely profitable to the oleo makers, is ruinous to butter makers, it is fraudulent, and we protest in behalf of the dairy interest and the consumers, and of every tiller of the soil. But these fellows, like all persons engaged in a fraudulent and illegitimate, but highly profitable business, care not a fig for the protest of anybody, so long as by using a part or the whole of their dishonorable profits, they can buy or control the courts or lawmakers, in their interests. At a meeting lately held, they contributed freely in money, and passed very strong resolutions, and assumed a bold and defiant attitude. They are either "whistling to keep their courage up," or they mean fight, and fight to the end; in either case, honest people everywhere, those in every branch of agriculture as much as the dairymen, and those in the cities who depend upon the farmers for their food supply, should unite in demanding of both the State and National Legislatures the most stringent laws against this fraud, and then demand of the courts that the laws shall be construed in favor of the protection of the people in their food supply, rather than in the interest of human sharks, who would rob the consumers and ruin the producers of honest butter.

It is much more honorable when asked for "bread" to give a "stone," than when asked for butter to give a vile concoction of the garbage house.

BREVITIES.

THE true seeds of potatoes will germinate if three years old.

ONLY regular subscribers need appy for our seed distribution. A stamp must be sent with every application.

ACCORDING to the experiments made by the Messrs. Sutton, of England, it is thought that Solanum Maglia, and not S. tuberosum, should have the credit of being the original parent of our cultivated potatoes.

THE experienced potato grower, Alfred Rose, writes us that the way to secure large yields is not to have the soil over-rich in manure, but just rich enough to grow good-sized tubers, and not all vines with a few small tubers.

WHETHER it is is better to dig potatoes as soon as they are matured, or to leave them in the ground until late in the Fall, depends upon the season. If dry, leaving them in the ground may do no harm; if wet, they will certainly sustain injuries which would have been avoided by an early digging.

THE RURAL NEW-YORKER has introduced, through its Free Seed Distributions, the Beauty of Hebron, White Elephant and Rural Blush. The Beauty of Hebron is now generally prized as one of our best early potatoes; the White Elephant as one of the best late. The Rural Blush is also late, of excellent quality and in most places an immense yielder. Its one fault is that it straggles somewhat.

IT does me good to read the RURAL, and I shall continue to read it until I become blind with age, if it continues to live the life it is now leading—an enemy to fraud, and a friend to a higher, nobler agriculture. I wish I had 20 copies of the issue for Dec. 19th. I would mark the article "Where shall we aim, at the head or the belly?" and send them to my friends. R. P. MCANLY.
Walnut Cove, N. C

IT is a good time now to sow potato seeds. Sow them as you would tomato seeds. When three to four inches high, prick them out and plant in three-inch pots, one plant to a pot. As soon as there is no danger of frost, or about May 20th for this climate, the plants, with the soil and roots intact, may be planted in holes prepared for them in rich, mellow soil of the garden. Tubers will form by Fall all the way from the size of a pea to that of a hen's egg, or sometimes even larger.

THE Ag. Ed. of the Vermont Watchman in, what seems to us, a frank, impartial review of farm journals, has this to say of the RURAL NEW-YORKER: "We have for several year regarded it as clearly the foremost agricultural paper in the world. In the abundance and excellence of its illustrations, in the integrity, ability and industry of its editors, and in the quality of its contributed matter, it outranks all competitors. It has a large capital behind it, which is spent lavishly to make it what it is, an honor to agricultural journalism. It pays its contributors well, and exacts their best work. A writer, however able, who will not give that, had better send his matter to other papers."

POTATO SPECIAL.

CONTINUED FROM PAGE 45.

SEEDLING POTATOES.

THE RURAL has frequently urged its readers to experiment with seedling potatoes, grown from the seed-ball or real potato fruit. We are no less anxious to urge upon our readers the importance of the work at the present time. New varieties of potatoes are absolutely necessary from time to time. All varieties, after a time, degenerate or "run out." Thousands of dollars have been spent by farmers for new potato "seed," that might just as well have been kept at home. We fail to see why farmers cannot produce new and valuable varieties for their own using. Then, again, the work will lead to further experimental work, which cannot fail to be beneficial.

There is no great skill required in producing seedling potatoes. As before stated, the potato ball, corresponding to the tomato, is the real fruit, the tuber being simply an enlarged, underground stem. In producing seedlings the ball is kept until it begins to wither, when the flesh is washed away from the seeds and the latter are preserved dry, as other seeds, are kept. The potato fruit is much less common now than it was some years ago. This is not surprising when we consider the fact that potatoes have been cultivated for the tubers alone, and no dependence has been placed upon the real seed for continuing the species. There seems to be no good reason why each reader of the RURAL should not devote a small space each year to seedling potatoes, thus supplying himself with strong tubers for planting, and possibly producing a seedling that will sell for a fine price.

Potato balls should be taken from the best and strongest tubers. "Like produces like," and if we wish to develop extra seedlings we naturally select seed from those tubers noted for quality, good shape and keeping. Most farmers understand how surely animals stamp their good and bad qualities upon their offspring. Why does not the same rule hold true of plant life? If there are any potato balls produced in your township, our advice is to procure them and experiment. We take it for granted that most of our readers have no greenhouse in which to start the seeds. That fact should not deter them from experimenting. With well-drained flower pots filled with mellow garden soil, satisfactory results can be obtained. Press the soil firmly into the pot. Sow the seeds half-an-inch apart, covering with one-eighth inch of soil, pressing soil lightly upon them. Place the pots in pans of water so deep that the water comes nearly to the surface of the soil, and let them remain until the surface soil becomes damp. Place the pots before a sunny window and cover each with glass. They will need no more water until the seeds germinate—about a week or ten days. Remove the glasses when most of the seeds have sprouted. It will be well to raise the glass gradually, first an eighth-of-an-inch, then a quarter, and then remove it entirely. The great reason for watering the seeds in this way is that the soil is not washed away. The early part of March will be soon enough to plant. The plants will then be large enough to transplant to little pots by early April. The little plants should be "pricked out" and planted one, two or three in each thumb-pot. By April 20 many of the leaves will be found of the shape and size shown at Fig. 19, while the plants will average four inches high. The great point now will be to see that these seedlings do not receive a check from over or insufficient watering, from too much or too little heat.

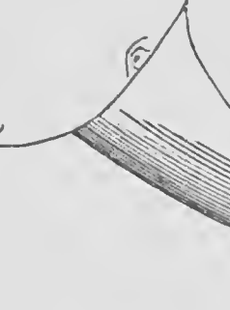

Fig. 19.

When all danger of frost is over, the little vines may be transplanted to a warm, well-prepared plot. They may be set in little holes dug with a trowel, one foot apart in drills three feet apart. The little balls of earth clinging to the roots of the plants should be thumped out of the pots and placed firmly in the holes. Thereafter, their treatment will be the same as potatoes planted from eyes.

Fig. 20 shows the exact size of a number of tubers raised from seeds at the Rural Grounds in this way. This illustration is taken from an old number of the RURAL. In the Spring following the digging, these seedlings can be planted, the smaller ones whole and the larger ones cut into two pieces. The tubers will vary as to size, quality, shape, etc., and a year or so of careful cultivating will be necessary to properly sort them.

* * *

A MELLOW soil, a moist soil well drained; plenty of potash, nitrogen, phosphoric acid, lime, and possibly magnesia, sulphur and salt, for mechanical effect, or for an effect not understood. Give the seed pieces enough flesh to support them until the shoots can be supported by their own roots. Plant them in depth according to the soil, whether inclining to clay or sand, from three inches to five inches. The distance of the hills or drills and of the pieces in them, should be regulated by the vigor and size of the varieties planted. Rank-growing varieties, the same as tall-growing corn, will not yield well if planted too closely together. Hilling-up on well-drained land never increases the crop. The fibrous roots extend from hill to hill, from row to row, and the soil should not be taken from them to heap it up about the stems where it is not needed. In hill culture, where the tubers crowd each other out of the ground, hilling-up is necessary only to protect the potatoes from air and light. Broadcast manuring is better than manuring in the hill, for the reason that it is the fibrous roots that need the food—*not* the tubers which are fed by the fibrous roots. Kill the potato beetles before they have injured the foliage. *Any* injury to the foliage will impair the vigor of the plant, and less vigor in the plant means less crop.

BE careful not to plant frost-bitten seed potatoes.

* * *

AVOID plowing potato land when it is not dry enough to crumble as it is plowed.

* * *

IT is a good plan for late potatoes, to sow blood, nitrate of soda or sulphate of ammonia, not until the sprouts show themselves above ground.

* * *

CULTIVATE shallow if you would avoid the worst effects of dry weather.

* * *

WE find that there are 673 potatoes of average size in a barrel. If the potato pieces are planted in drills one foot apart, the drills being three feet apart, 14,520 will be required for an acre, or about 4⅓ barrels, if we make five pieces of each potato.

* * *

WHERE are the old favorite potatoes of 50 years ago?

* * *

THE RURAL'S experiments with 32 different kinds of fertilizers upon a worn-out soil show that the potatoes need a complete fertilizer *i. e.*, potash, phosphoric acid and nitrogen, with most of the first.

* * *

THE result of 70 analyses of the tuber, by various chemists, embracing a great many varieties and modes of culture, are summed up in the following table:

	Minimum.	Maximum.	Average
Water	68.29	82.88	75.77
Nitrogenous substance	0.50	3.60	1.70
Crude fat	0.05	0.80	0.16
Non-nitrogenous extractive substances (starch, sugar, etc.)	12.05	26.57	20.56
Fiber	0.27	1.40	0.75
Ash	0.42	1.46	0.97

As the result of 53 analyses of the ash of the tuber, we have the following:

	Minimum.	Maximum.	Average.
Potash	43.97	73.61	60.87
Soda	0.00	16.93	2.62
Lime	0.51	6.23	2.57
Magnesia	1.32	13.58	4.69
Ferric oxide	0.04	7.18	1.18
Phosphoric acid	8.39	27.14	17.33
Sulphuric acid	0.44	14.89	6.49
Silica	0.00	8.11	2.17
Chlorine	0.85	10.75	3.11

TUBERS FROM SEED THE FIRST YEAR. (Showing various shapes and sizes.) Fig. 20.

Six analyses of the tops give the following average results: Potash, 21.78; soda, 2.31; lime, 32.65; magnesia, 16.51; ferric oxide, 2.86; phosphoric acid, 7.89; sulphuric acid, 6.32; silica, 4.32; chlorine, 5.78. Potash and phosphoric acid are therefore the predominating ingredients of the ash of the tuber, and soda and silica are evidently quite unessential since they may be entirely absent; soda may also be entirely wanting in the tops.

* * *

From these figures it may be estimated that in a crop of 150 bushels weighing 9,000 pounds, and 600 pounds of tops, we should remove, of the three most valuable ingredients of plant-food, the quantities per acre given in the following table, omitting fractions. For the purpose of comparison, we give also the quantities of these three substances gathered by a crop of wheat, 25 bushels, and straw, 2,500 pounds; and of Indian corn, 50 bushels, stover 4,500 pounds, and cobs 600 pounds.

	Nitrogen.	Phos. Acid.	Potash.
Potatoes: tubers	26	15	53
tops	—	4	11
Total	26	19	64
Wheat: grain	30	13	8
straw	12	6	17
Total	42	19	25
Indian corn: grain	48	20	12
stover	22	23	41
cobs	2	—	4
Total	72	43	57

* * *

From these figures it appears that to produce the potato crop, potash is required in larger proportion than either nitrogen or phosphoric acid, and that more is required for this crop than for either wheat or corn, notwithstanding that the latter is such a gross feeder. When we come to consider the comparative exhaustion of the soil by the two crops, remembering that of the corn crop, only the grain with 12 pounds of potash, is liable to leave the farm, while of the potato crop the tubers, with 53 pounds of potash from every acre, are usually exported, the usefulness of potash manures in potato culture would appear to be very plainly indicated. To the quantity of nitrogen gathered by the potato crop, as given in the table, something must be added for the tops, with reference to which we find no determinations of this element. Making due allowance for this, the best manure for the potato would seem to be a complete one as we have said; that is, one containing all three of these substances—nitrogen, phosphoric acid and potash, with a large proportion of the last. Make a note of this Rural readers.

* * *

Add potash salts to farm manures if you would increase the yield.

* * *

Sulphate of potash has given, in many cases, larger crops than muriate of potash.

* * *

Salt on potatoes, according to Prof. G. C. Caldwell, may increase the crop somewhat, but it impairs the quality by diminishing the quantity of starch.

* * *

Whether potatoes deteriorate or grow less in yield depends upon the congeniality of the soil, situation and culture.

* * *

It depends also upon the selection of "seed." We are fully satisfied that the yield may be maintained, if not increased, by selecting seed potatoes from the most prolific hills.

* * *

Dr. Hoskins prefers potatoes to either beets or turnips for stock-feeding.

* * *

The best potato soil is a sandy loam or one that is midway between a light and a heavy soil. There is no better way of preserving moisture than by keeping the surface soil mellow.

* * *

Lime has often been recommended as a preventive of potato rot. The N. Y. Experiment Station does not find it so. The Director filled two barrels with sound White Star potatoes, in the Fall of 1883, in one of which he sprinkled air-slaked lime, as the tubers were put in, in sufficient quantity to whiten them. On April 3d the potatoes in both barrels were examined. The one treated with the lime contained 68 decayed tubers, while the other contained but 52. It thus appears that in this experiment the lime exerted no beneficial influence.

DR. LAWES' POTATO EXPERIMENTS.

The following table shows the average yield of potatoes for five years at Rothamsted, England, with farm manure, with different chemical fertilizers and without either fertilizers or manure:

Average of 5 Seasons, 1876, '77, '78, '79 and 1880.

		Tons.	cwts	Tons.	cwts	Tons.	cwts	Tons	
	Unmanured	1	18	0	6¼	0	2¼	2	6½
	Farmyard Manure (14 tons)	3	19¾	0	7⅝	0	6⅝	4	13⅝
3	Farmyard Manure (14 tons), and 3½ cwts. Superphosphate (1)	4	9½	0	8	0	8¾	5	6¼
	Farmyard Manure (14 tons), 3½ cwts. Superphosphate, and 550 lbs. Nitrate of Soda	5	8	0	7	0	19½	6	14½
	400 lbs. Ammonia-salts (2)	1	19½	0	7⅛	0	3½	2	10⅛
	550 lbs. Nitrate of Soda	2	11⅞	0	6⅞	0	5¼	3	4
7	400 lbs. Ammonia-salts, 3½ cwts. Superphos., 80 lbs. Sulph. Potash, 100 lbs. Sulph. Soda, 100 lbs. Sulph. Mag	5	14¼	0	8¼	0	14¾	6	17¼
8	550 lbs. Nitrate of Soda, 3½ cwts. Superphos., 300 lbs. Sulph. Potass, 100 lbs. Sulph. Soda, 100 lbs. Sulph. Mag	5	19⅞	0	7⅜	0	19⅛	7	6¾
9	3½ cwts. Superphosphate	3	0¾	0	8	0	4⅝	3	13⅜
10	3½ cwts. Superphosphate, 300 lbs. Sulphate Potash, 100 lbs. Sulphate Magnesia, 100 lbs. Sulphate Soda, 100 lbs.	8	4½	0	6½	0	4⅞	3	15⅞

NEW POTATOES IN NEBRASKA.

H. H. WING.

We have had occasion to test some of the new varieties of potatoes the past season, and below are given the results. The potatoes were planted in the peculiar fine loam soil of this region and received no manure of any kind. The rows were three and a half feet apart, and the single eyes were dropped one foot apart in the rows.

VARIETY.	Rank in comparison with 81 varieties grown side by side.	Yield of merchantable potatoes per acre. Bushels.	Per cent. unmerchantable.	Total yield per acre. Bushels.
EARLY VARIETIES.				
Queen of the Roses	12	266.7	11.5	301.2
Early Howard	13	261.2	5.6	276.8
Hall's Early Peachblow	17	246.4	17.4	298.2
Early Maine	20	234.6	10.4	262.
Lee's Favorite	26	218.6	15.7	259.3
Vanguard	7	216.4	17.2	261.6
Pearl of Savoy	9	211.8	14.	246.3
Vick's Extra Early	77	72.6	51.7	150.4
LATE VARIETIES.				
Cloud's White Chief	1	401.	16.5	430.6
Chief	2	366.1	11.7	414.9
State of Maine		297.8	19.4	369.6
Empire State		297.3	34.4	452.8
Dakota Red	14	259.2	24.1	341.6
Home Comfort	18	246.3	17.4	298.2
Columnis Superb	22	231.	22.2	296.9
Peerless Peachblow	28	212.4	17.3	256.8
Seneca Red Jacket	32	195.8	20.9	247.7
Cayuga	40	164.7	28.	228.7
Iroquois	56	126.1	29.7	179.3
Tremont	67	79.	37.	153.9

We have made the following notes in regard to the shape, size and freedom from scabbiness of the various varieties. While we have had very little rot nearly all of the varieties have been more or less affected with scab.

Queen of the Roses, slightly blushed, long, rather knobby, eyes shallow, very little scab.

Early Howard, white, long oval, regular, eyes shallow, very little scab.

Hall's Early Peachblow., white, splashed with pink, round oval, somewhat knobby, eyes rather deep, quite scabby.

Early Maine, slightly blushed, long oval, very regular, slightly scabby.

Lee's Favorite, white, oval, regular, eyes rather deep, some scabby.

Vanguard, slightly blushed, long oval, very regular, rather deep eyes, quite scabby.

Pearl of Savoy. slightly blushed, round oval, mostly regular, slightly scabby.

Vicks Extra Early, white, round oval, small regular, eyes shallow, slightly scabby.

Cloud's White Chief. white, round oval, large, somewhat knobby, eyes shallow, considerable scab.

Chief, white, long, nearly regular, eyes rather deep, quite scabby.

State of Maine, white, long oval, large, somewhat knobby, eyes shallow, somewhat scabby.

Empire State, white, long oval, somewhat knobby, eyes rather deep, somewhat scabby.

Dakota Red, red, long oval, very knobby, eyes rather deep, somewhat scabby.

House Comfort, pinkish, long, nearly regular, eyes shallow, scabby.

Columnis Superb, white, long, somewhat knobby, eyes rather deep, very little scab.

Peerless Peachblow, red, oval, very knobby, skin rough, eyes shallow, no scab.

Seneca Red Jacket, white, long oval, nearly regular, eyes shallow, some scabby.

Cayuga, white, long oval, nearly regular, eyes shallow, no scab.

Iroquois, white, oval, regular, eyes shallow, very little scab.

Tremont, white, round oval, regular, medium size, eyes shallow, very little scab.

Ind. Co., Univ'ty, Neb.

POTATO CULTURE IN GEORGIA.

W. B. JONES.

The potato does not find the extended, prolonged use here, that it does in more northern latitudes. [In 1884, 9,175 acres in Georgia were planted to potatoes, producing 614,725 bushels valued at $639,314.—Eds.]

For early market and quick maturity we plant Philip and Early Rose in February or early March. Later varieties, as Peachblow or Goodrich are planted later and saved longer for domestic purposes. Our soil is light with little clay at surface and needs to be filled with humus, serving both as a mulch and a manure. Stubble deeply plowed does well, with ashes or potash compost.

In February the soil is well broken, and laid off in furrows three feet apart, and bedded out into three-feet beds. The potatoes are held in ashes for a few days after being cut, and then dropped in single pieces, one foot apart. The eyes are placed upwards, and small potatoes planted whole. A compost of humus, kainit or ashes and acid phosphate, or of rotted cotton-seed and decayed matter is sprinkled liberally over the "seed" so as to nearly fill the furrow. The soil is turned back from either side by double-shovel, hoe or turning plow. Before the plants appear, a harrow is run over the field to loosen the soil and remove excess of dirt thrown over the potato to protect it during coldest weather. The after cultivation is with the ordinary horse hoe or cultivator running between the rows or beds, gradually raising beds to the plants. If the seed-pieces are planted deep, level culture succeeds as well as bed system, but here we must plant early and deep for the warm suns of May and June would soon destroy the vines. This brings a summer crop and, if not marketed, difficult to keep, and even to ship any distance in crates or barrels, as heat and moisture soon destroy the tubers.

In gathering, we plow them out with a turning plow and pick by hand. Seed saved from this crop must be kept in dry sand, under a house, in a cool place.

The second crop may be planted in August, and soil leveled after dropping in deep furrow, mulch with a thick coating of straw or leaves. This crop is a precarious one, but keeps well during Winter and furnishes seed, dug in November, for next planting. Any distance from market, the potato is not profitable to handle, unless the earliest June and July crops are taken. We can grow them easily, and seemingly sound and healthy, but the keeping is difficult. The seed degenerates with us, and most growers buy their seed, each year, of Northern producers. The potato would be a boon and a profitable crop but for the summer heat and moisture which frequently destroy the tubers even in cool places.

POTATOES IN TEXAS.

T. V. MUNSON.

1. *Best Varieties for this Section.*

Ans.—Early Ohio, all things considered, though Early Rose is much planted.

2. *How and when selected, and how treated for seed.*

Ans.—For early crop grown chiefly for shipping to Northern market in May and June, as "new potatoes," seed from the North (Kansas, Nebraska, Iowa or Minnesota) proves best, if pure and well grown and medium to large in size. Cut lengthwise into four pieces each, early in February, placed in shallow boxes, dusted with lime or ashes, kept in a warm cellar till March, or when the eyes have started, half an inch.

3, 4, 5. *Soil, location, preparation, planting, etc.*

Ans.—A well-drained, sandy loam, having an eastern or southern slope, heavily manured with well-rotted, fine, stable manure and ashes; 25 tons or more of manure and one of ashes to the acre, well plowed in, and fined with an Acme harrow; then laid off with light furrows, three feet apart, running north and south. Then commercial fertilizers, rich in soda, potash and phosphorus, sown lightly along the furrow, and the cut potatoes (prepared as stated above) dropped in the furrow one foot apart. Then a light furrow is turned back upon the pieces of potato to the depth of three or four inches, and then half an inch of fine, well-rotted manure should be scattered over the row in a strip 18 inches wide, in order to keep the surface soft and loose at all times, as the tuber is an under-ground stem, and the least binding nature of the soil cramps the growth, on the same principle that onions make small or large bulbs, according to the softness of the surface soil.

6. *Culture, etc.*

As soon after planting as the first rain, when settled enough for the soil to crumble, or in absence of rain, when the potato sprouts are within an inch of surface on an average, draw a steel tooth rake over; for the field culture, a light, fine tooth harrow, lengthwise over the rows, so as to loosen the crust, mix the surface manure with surface soil, and destroy the young weeds. This leaves the ground level, and it should be kept so, by using thereafter a Planet Horse Cultivator or other such implement which will stir the soil evenly, and leave it level. The row itself should be kept clean and loose, but *never hilled*, as the nearer the tubers are kept to the surface, but still covered, the finer the growth and richer the quality of tuber. Very deep culture after the plants are up, should be avoided, as the deep-feeding roots of the vines will be broken and growth stopped for a time. A crust should never be allowed to form after hard, beating rains. That is the chief object of the surface belt of manure last put on. If the potato is hilled much, growth of the first-formed tubers stops, and new ones are thrown out higher up the stem, near the surface where there is less pressure, and more air and warmth. After the soil begins to rise and crack with the growth of the tubers, cultivation should cease, as any cutting of the roots now checks growth for a time, and when it starts again, the potato is liable to become knotty. The same effect is produced only more suddenly and effectually, by the cutting of the tops in part or whole. Hence insects—potato bugs—should never be allowed to infest the vines and eat the leaves. Abundant remedies are well known in Paris-green, or London-purple.

Blight, rot, etc., come from extremes of temperature or moisture, which are best obviated by having a porous, well drained soil.

8. 9. *Digging, Marketing, etc.*

As soon as the vines have ceased growing and show a slight yellowing of the leaves, and the tubers begin to assume a whitish appearance, and the skin begins to cling a little on the most mature potatoes, it is full time for the market man in the South to have his crop out and on its way northward, or to the market stalls.

A plow, or several of the improved diggers render effective service in skillful hands.

As soon as the potatoes are thrown upon the surface with the digger, pickers should follow in two gangs, the first with the baskets taking only the whole, sound marketable potatoes, carrying them directly to the packing-house, or shed, out of the sun, as an Irish potato, heated through in the direct Southern sun, will quickly sour and rot. In the early season when prices are high, one-third bushel boxes, as for peaches, should be used for shipping cases. Later, larger boxes or ventilated barrels can be used. The early crop will not keep here beyond three weeks or a month with best care, in dry, cool shade. The small potatoes are gathered by themselves, put away in a well ventilated barn, or open shed in shallow layers, for a week or so, and at the first rainfall in July, the ground being properly prepared, are planted whole (if cut they usually rot, but sometimes, if weather is right, will come up much sooner than the whole potato) and will come up in course of three weeks or a month, and, if Fall is favorable, will make a nice crop for Winter use and will keep well. But this product should not again be used as seed.

Denison, Texas.

NOTES ON THE POTATO.

CHAS. A. GREEN.

The Early Ohio has given us good results as an early potato. White Star, Mammoth Pearl, Beauty of Hebron, and Dakota Red are favorites for later. All these and other varieties have rotted to such an extent as to render the crop scarcely worth digging, with the exception of the Dakota Red, which has proved almost entirely rot-proof. We find that the Dakota Red has defied the rot in other sections of Western New York. One farmer had sixteen acres and secured a big yield. It is a large red potato, with eyes too deeply sunken, and quality medium, and it is a vigorous grower and a great yielder.

[It does not yield heavily at the Rural Grounds.]

Last June we planted some hop roots that were left in the packing house, and in the row a few straggling potato vines appeared. The potatoes were not hoed and received no attention, we supposing them to be some chance seedlings of a worthless variety that happened to spring up. Late in the Fall our foreman saw a large tuber protruding from the hill, which induced him to dig and see what the hill produced. He brought into the office a bushel basket nearly half full of monstrous specimens. I cannot remember when I have

seen so many such large potatoes taken from a single hill. Considering the rot affecting other varieties, and considering the many valuable features of the Dakota Red, I consider it the most promising variety for our section for a late potato.

We find that a friable soil, not inclined to harden, is the most desirable for the potato. The soil should be deep, well drained, and in good heart. The best results, in this section, are secured by applying manure freely on a clover sod early in the Spring. The clover is permitted to grow up through the manure until about June first, then all is turned under deeply, and the soil pulverized in the most thorough manner; then a dressing of from three to five hundred pounds of phosphate per acre is applied. The ground is then marked three feet apart each way and the seed dropped. As much of the potato as possible, and from one to two eyes are planted in each hill. We have practiced different methods of planting, and have succeeded by plowing furrows, dropping the seed, and covering with a plow, ut where planted in hills as indicated above, we conclude that the hoe is the best implement for making the hill and for covering. We have found that too deep planting is disastrous, especially if the season proves wet. When planting late, the potatoes may be planted deeper than if planted earlier.

The object in planting late is that the potato comes up in a short time, and makes a rapid growth, and the soil, not being subjected to heavy storms, is not compact, and remains loose throughout the season with proper culture. The potato cannot develop to its best state unless the soil is loose and friable to a considerable depth. This friable condition of any but sandy soil cannot be maintained except by late planting, and by the loosening furnished by the clover sod. On sandy soil such treatment may not be necessary. Our soil is clay mixed with sand with a tendency to harden. We have applied Bradley's fertilizer in the hill at the rate of a large spoonful per hill on rich soil, and the results were satisfactory, providing the potatoes were not permitted to come in contact with the fertilizer. The potatoes were not affected by growing in close contact with the fertilizer, and yet, I do not consider this method of applying the fertilizer the best, as the roots of the potatoes soon get far beyond reach of it when dropped in the hill.

We hoe the potatoes as soon as they appear above the ground, and before the weeds have attained sufficient size to impede the hoe to any extent. At this stage a few brushes of the hoe do the work completely. In less than a week after the potatoes have pushed up several inches, a shovel-plow will cover up any weeds that have appeared since. Soon after, the cultivator is set to work leveling down the ground. My theory has been that level culture is the best method, but having practiced it enthusiastically for several years, and having each year been beaten in yield by an Irish laborer upon our place, whose potato patch was adjacent to mine, my confidence in level culture is somewhat shaken. The Irishman's method of ridging with a shovel-plow proved more disastrous to the weeds with less labor. I am not prepared to say positively that hill-culture gives the best yields, but desire to get further light on the subject. It is a fact that a broad-winged shovel plow will cover up and destroy more weeds at much less expense than any other method. Since I have experimented with the shovel-plow, I have followed it immediately with the cultivator, loosening the ground to a considerable depth. This I deem of vital importance, if not done too late in the season, so as to disturb the roots.

We have found no better method of preparing the soil for strawberries and other small fruits that require freedom from weeds, than by thoroughly enriching the soil and planting early, to early varieties of potatoes. The potato crop can be dug in August, or the first of September. After having received thorough culture, the ground may be cultivated thereafter. This gives thistles, Quack Grass and other weeds little chance for securing a foothold, and rings the death knell of the weeds, if pursued with energy. The ground can be planted to strawberries in the Fall, or, if not free from weeds, cultivation can be continued at frequent intervals until Winter approaches, and the ground be planted the following Spring.

The past two seasons we have dug our potatoes with a strong shovel-plow with broad wings, to which we attached two horses, and applied a heavy weight in the shape of a stone. This made the plow run deep. The horses walked between the rows, and the shovel-plow passed under the row of potatoes, throwing up and exhibiting to sight nearly the whole crop, and destroying scarcely any. The potatoes were immediately picked, and after the whole field was secured in this manner, and the vines collected, we cultivated with a two-horse cultivator and picked over again, and then harrowed and picked over again, if any were found upon the surface. We found that this was an easy way to harvest the potatoes, and the soil was thoroughly cultivated by the process.

We are not troubled to any serious extent with insects. Usually one application of Paris-green at the time when the young beetles begin to be destructive, is sufficient. If a rain occurs after applying the Paris-green, we are obliged to give a second application.

Rochester, N. Y.

VERMONT POTATO NOTES.

1st. The most profitable potatoes, all things considered, in this section, are the Snowflake and Landreth's Garfield. Buyers for Boston market will pay from five to ten cents more per bushel in the Fall for them, than for any variety you can mention.

2d. We always select good-sized potatoes for planting when we have them. If the tuber is quite large we cut it into four pieces, and put one piece in a hill. If the potato is about the size of a hen's egg, I should prefer to drop one in a hill, providing I did not plant in drills.

5th. We use farm manure, soil clay loam; plant in hills 2½ by 2½ feet, cultivate both ways.

6th. Flat cultivation will not do here. We cultivate and hoe twice during the season.

8th. Potatoes should be sorted and picked up as soon as they are dug; it is well, of course, to let them dry off first, and they should be dug as soon as they are ripe, and not be left in the ground.

9th. The best time for farmers to sell is in the Fall by all means.

11. Average yield in this section is about 200 bushels to the acre. O. H. ALEXANDER.

HISTORY OF THE POTATO.

REV. L. J. TEMPLIN.

THE early history of the potato is involved in obscurity. It has been supposed that the plant was first found by Europeans in Virginia, and that Sir Walter Raleigh carried it thence to England in the year 1586. Raleigh never visited Virginia. He only furnished ships and means to aid in planting a colony there. The most probable theory to my mind is, that Sir Francis Drake, returning from explorations in the Pacific Ocean, coasted along the western shores of South America, one of the native habitats of the potato, and while in that region procured some of the tubers which he carried with him to England. On his homeward voyage, he touched on the shores of Virginia, and took off the discouraged colonists and conveyed them back to the mother country. If this is correct, then this introduction probably occurred as early as 1565, this being the date of Drake's return from the West. The potato was doubtless known to Europeans at an earlier date, as Columbus, during one of his voyages, found a root cultivated on the island of Cuba, that was used for food by the natives, and this was no doubt the potato.

Early European voyagers and travelers found the potato growing in the Andean forests and along the Pacific coasts on both sides of the equator, through several degrees of latitude. It was also found in cultivation, the natives testifying that it had been in cultivation as an article of diet from time immemorial. Spanish and Portuguese adventurers probably introduced the potato into those countries at a very early day, whence it probably made its way into Italy. It is quite certain that it was cultivated in Spain as early as 1550. The time of its introduction into Ireland, where it has become so important as an article of food that a general failure of the crop results in a famine, is in dispute, some claiming that it was from Spain by a sea captain in 1565, others that it was procured from Raleigh in England.

Germany received the potato in 1710. The Government gave great encouragement to its culture, even using compulsory means, in some instances, to promote its cultivation. Its importance in Germany as an article of diet is second only to what it is in Ireland. In France, where the potato was introduced at the beginning of the 18th century, it had to fight its way to popularity against great opposition. The National College of Physicians pronounced it poisonous. The Catholic priests pronounced it an evil root because it was not mentioned in the Bible.

Through the address of a courtier King Louis XIV was interested in the plant, and it was introduced into the royal gardens. The example of the sovereign was followed by the nobles and thus it soon became popular.

It seems strange to us that a plant that has so many qualities to commend it should have required 250 years to make its way to general popularity, but such is the case; and it was not till the beginning of the present century that it came to be appreciated as its merits deserve.

Canon City, Col.

ILLINOIS POTATO NOTES.

THE early varieties now in highest favor in this section are the Early Ohio, Early Vermont, and Early Rose, standing in the order named. The Beauty of Hebron is highly spoken of by those who have grown it, but neither the time nor the extent of its being grown here justifies its unqualified recommendation. The Early Ohio matures earlier, yields more, is of better quality, and keeps better than any other variety grown here. But from my experience with other varieties, I would say that it would not do so well in other localities. Late potatoes are not extensively grown. Our Summers are too dry and warm. The late potatoes almost stop growth during the latter half of June, and during July and August, and if they do not start again in September the yield is very light; while should they make a second growth, very frequently they fail to mature before frost, and as a result are of poor quality.

Potatoes require a loose, lively, light soil. Hence we avoid clay and select a soil with a good percentage of sand and humus. For late potatoes we prefer a northern slope; for early potatoes a southern slope. Sod, if well rotted, is much better than fallow. The sod should be plowed in the Fall, and re-plowed, or cut up with a pulverizing harrow, in the Spring. I prefer the latter. Harrow the ground until it is thoroughly fined, but do not roll or drag it.

The only fertilizer that I have ever used, or have known anyone else to use in this section, is barn-yard or stable manure. It should be thoroughly rotted. Potatoes will stand heavy manuring. Of the varieties grown here, Early Rose should be manured the heaviest, and Peachblow the lightest. If the ground were fallow, I would use manure liberally; and though a heavy sod, I would yet manure. In either case I spread the manure on the surface after plowing, and harrow it in.

I find that the man who can store potatoes conveniently and keep them properly, nearly always makes money by holding them till February or March. If you have a cellar that is thoroughly ventilated, cool, and dark, put the potatoes in it at once, though they are harvested in July, being careful to put them in bins raised from the floor, and not more than a foot deep in the bins. If you cannot observe every one of these points, put the potatoes in some airy (but as dark as possible) out-building. Moisture and light are the two agents most destructive of potatoes. Potatoes may be stored in boxes or barrels, raised from the floor; but I prefer shallow bins. This, of course, applies to storing in cellars. I have always succeeded in keeping potatoes well in pits.

Early potatoes are a decidedly profitably crop with us. The average yield is nearly two hundred bushels to the acre. I have raised about four hundred bushels per acre. But my late potatoes oftener proved unprofitable than profitable; and this is the common experience. The average spring price, for the last 20 years has been fully 50 cents per bushel.

Quincy, Ill. JOHN M. STAHL.

MAGNUM BONUM AND RURAL BLUSH.

I HAVE tried or grown thirty-five varieties of potatoes. Magnum Bonum, White Elephant and Rural Blush yield the best. Early Mayflower, Early Telephone and White Elephant are the best flavored. I planted a small plot of ground in the garden to Magnum Bonum and Rural Blush; the Magnum Bonum yielded at the rate of 1,202 2-15 bushels per acre, the Blush yielded 1,030 bushels per acre. I put hen manure and wood ashes quite heavily on the ground, plowed the ground six inches deep, and raked it fine. I planted the potatoes one foot apart each way, and gave them two hoeings only, and left the ground level; planted one small piece in each hill; I think a fungus produces scab; the worst scabby potatoes I ever raised were on ground that had no wire-worms in it.

Onarga, Ill. H. H. CLARK.

THE RURAL NEW-YORKER'S

SPECIAL CLUBBING

Combinations with other Journals.

The RURAL, including its Free Seed Distribution, and the INTER-OCEAN, one year for $2.65.

The Inter-Ocean is the great representative weekly of the West. Send for free specimens to Chicago. Subscribe for both papers through the R. N.-Y.

The RURAL, with Seed Distribution, and the DETROIT FREE PRESS AND HOUSEHOLD.

One of the sprightliest and funniest weeklies published. Both one year for $2.75. Subscribe through the R. N.-Y.

The RURAL, with its Seed Distribution, and the PHILADELPHIA WEEKLY PRESS.

A clean, wide-awake paper, full of special features of interest. All one year for $2.65. Address the Weekly Press, Phila., Pa., for free specimens. Subscribe through the R. N.-Y.

The RURAL, and Seed Distribution, and the BUFFALO EXPRESS.

One of the cleanest, staunchest and most lively weeklies published. All one year for $2.50. Address the Buffalo Express, Buffalo, N. Y., for specimens. Subscribe through the R. N.-Y.

The RURAL, and Seed Distribution, and the DEMOCRAT AND CHRONICL WEEKLY.

All one year for only $2.50. The Chronicle is the old standard Republican paper of the Genessee Valley. It is published in Rochester, N. Y.

The RURAL, and Seed Distribution, and the N. Y. WORLD, the great Democratic Weekly. All one year for $2.65.

The RURAL, and Seed Distribution, and COTTAGE HEARTH, for $2.25.

The Cottage Hearth is a clean family monthly, of Boston, Mass. Published at $1.50 per year. This is a limited offer and should be accepted soon. Subscribe through the R. N.-Y.

The RURAL, with Seed Distribution, and the NATIONAL REPUBLICAN, of Washington, D. C., for $2.25.

The National Republican is a clean weekly Republican paper, printed at the National Capital. Is up with the times. Subscribe through the R. N.-Y.

The RURAL, with its Free Seed Distribution, and the MORNING HERALD, of Baltimore for only $2.25

The Morning Herald is a wide-awake, progressive paper, printed at Baltimore, Md. It is widely circulated and growing rapidly. Subscribe through the R. N.-Y.

Send to either of these papers for specimen copies, which will be gladly furnished.

PURE, TRUSTWORTHY, INDEPENDENT, Alive, Sparkling.

FOR THE

NEW YEAR.

THE ABLEST FARM WEEKLY IN AMERICA.

HONEST, LIBERAL PAY

FOR THOSE WHO AID IN EXTENDING THE RURAL'S CIRCULATION FOR 1886.

The RURAL NEW-YORKER never SELLS any of the articles which are presented as compensation to those who send us subscriptions either singly or in clubs. The articles offered are the best of their several kinds. They are just as represented, and we guarantee them to be such. They may be returned at our expense if unsatisfactory in any way. If readers desire to purchase any of the articles offered in our premium-lists, which will be sent to all applicants, they must apply to the manufacturers, mentioning the R. N.-Y. The RURAL is not a trade journal.

AN $80 BRADLEY MOWER FOR 80 SUBSCRIBERS,

A $60 Sewing Machine for 40 subscribers.
A $57 Mystic Range for 57 subscribers.
A $4 Ideal Fountain Pen for 4 Subscribers.
A $50 Syracuse Sulky Plow for 50 subscribers.
A $6 Field Force Pump for 6 subscribers.
A $4 Enterprise Meat Chopper for 4 subscribers.

For hundreds of other articles, which we offer for clubs, see our Regular premium-List, also our Special List, which offers $3,300 worth of sterling articles for the largest clubs sent by subscribers only, not by agents. These will be sent free to all who apply.

IDEAL FOUNTAIN PEN.

Every one who has any writing to do should have one of these delightful pens. It is not only worth its weight in gold, but is indispensable to every man who has occasion to write. For full description write to the Ideal Fountain Pen Co., 155 Broadway N. Y., for a circular. For a club of four subscribers we will give a No. 2, with a No. 5 pen, worth $4. For a club of five we will give a No. 2, with a gold-banded holder, or a No. 3, with No. 6 pen, either worth $5.

Either of these pens will be sent in a substantial case, prepaid in registered letter, and warranted to fit your hand, or be exchanged for one that does. You may step in and ask your pen dealer to show one, and get his price for it, and thus see that the best way is to secure it by getting up a club for the RURAL.

Please do not get the idea that this is a cheap stylographic pen or the penograph, or any other of the inferior pens. It is not, but a first-class gold pen with a hard rubber fountain holder, and one which we have used with so much satisfaction that, after trying all the others, we would not part with it for any price. Farmers, Clergymen, Boys, Girls, School-teachers, Everybody, here is a chance we wish you to embrace, for we know its value. No more useful or appropriate present can be found for a friend, and you can earn one with little effort. We should have calls for 500 at least. We know it will please all.

For Three New Subscribers.

You may select an Enterprise Meat Chopper No. 10, or two Knives, or a Knife and Pair of Shears, or a Pruning Knife, or a Pair of Folding Scissors, or a Pruning Saw, or a Wilson Whiffletree, or any one of the following books: Home Studies in Nature, Wallace's Ben Hur, Boots and Saddles, The Man Wonderful, Beecher's Life Thoughts The Rose, Successful Men, Talks to Farmers.

The best sewing machine in the world, working upon an entirely new principle, will be given to agents for 40 subscribers—freight paid. Lowest retail price, $60. We guarantee it in every way. It must not be classed with the low-priced sewing machines offered by other Journals. It is worth $60. See Premium List, which will be sent to all applicants.

What You Can Get.

By sending One new Subscriber.

List 1.—Any PRESENT subscribers who will send us ONE NEW one, may select any one of the following: 12 plants of the Marlboro Raspberry, or 12 plants of the Rancocas Raspberry, or six plants of Golden Queen Raspberry, or eight plants of the Jewell Strawberry, or three plants of the Earhart Everbearing Black-cap Raspberry, or one Poughkeepsie Red, or one Ulster Prolific Grape Vine, or a combination Saw Set, or a beautiful Silver-Plated Butter Knife, or either "Needle Work" or Knitting and Crochet," by Jennie June, or any book of the "One Syllable Series." See REGULAR Premium List.

Twelve subscribers will entitle the sender to a Lewis Force Pump, or a Universal Scale.

Five New Subscribers.

Will entitle the sender to a Cole Plow, or a Keystone Washer, or a Syrup Pitcher, or a half-dozen teaspoons or forks, or a game bag.

Six New Subscribers.

Will entitle the sender to the Field Force Pump, $6, and worth to any fruit grower or any house-holder, twice the money, or an Accordeon, or a Perfect Milk Pail, or Keystone Wringer. See regular Premium List for full descriptions.

What You Can Get for Eight New Subscribers.

Eight subscribers entitle the sender to a Shepherd Lawn Tennis Racket, or a violin with a bow and case complete, or an Eclipse Post hole digger.

Ten subscribers will entitle the sender to Nature's Serial Story by E. P. Roe, or a combined anvil and vise, or an Accordeon.

What You can get for Four New Subscribers.

A No. 2 Ideal Fountain Pen and Holder, with filler and case; warranted to fit the hand and please, or a No. 22 Enterprise Meat Chopper, or an Emmerson Cross-cut Saw, or any of E. P. Roe's Works, or a Farm Bell worth $5. or a Wheeden Toy Engine.

The Enterprise Meat-Chopper.

Every family should have one. Size No. 10 *will thoroughly cut one pound in a minute. The meat is chopped—not mashed. The machine is simple and durable. The price is* $4.00, *and we give it for three subscribers. The RURAL sells nothing except the R. N. Y. The No.* 22 *cuts two pounds per minute. Price* 4.00, *Given for four subscribers. This is the size you should have. Address The Enterprise M'f'g Co., cor. 3rd and Dauphin Streets, Philadelphia, Pa., for circulars.*

Thirty-two subscribers will entitle the sender to a Sun Type writer.

THE BEAUTIFUL POSTERS

OF THE RURAL NEW-YORKER WILL GLADLY BE MAILED WITHOUT CHARGE TO ALL WHO APPLY FOR THEM.

7. Fifty subscribers entitle the sender to a Syracuse Sulky Plow complete, with extras, and freight paid, if not amounting to over $2.50.

8. Fifty-seven entitle to $57 Mystic Range.

OUR ONLY TERMS.—Yearly subscription postpaid (52 weeks), $2.00; half yearly (26 weeks), $1.10. Payment invariably with the subscription. This Premium List holds good until July 1st, 1886.

FOR TWO NEW SUBSCRIBERS.

Any one sending two New subscribers, may select any three of the plants for one subscriber or a Niagara Grape Vine, or a Louderback's Combination Tool, or a Needle Hay Knife, or a Pearl Rug Maker, or a Dust-pan, or a Pair of Shears, or a Knife, or a Shot Flask, or a Watch Charm, or a Harmonica, or a Premium Drill, or "Stop Thief" Scale, or any one of the following books: American Political Ideas, Uncle Tom's Cabin, Fruit Culture, Talks Afield, How to Paint, Low Cost Houses, Comforting Thoughts, Highways of Literature, Boy's Useful Pastimes, What Girls can Do: Simple Ailments of Horses.

THE SEED DISTRIBUTION

of the RURAL NEW-YORKER is sent to all REGULAR subscribers who APPLY INCLOSING A STAMP. It is sent ONLY to REGULAR subscribers.

Eighty subscribers will entitle the sender to a Lady's gold Chatelaine Watch, or Pieper breech-loading shot gun, or a Bradley Mower.

These premiums are given by the Publishers *for procuring* subscribers, *not to* subscribers.

6. Forty subscribers entitle the sender to a No. 4 Avery Sewing Machine (see premium list), delivered, freight paid. For descriptive list, address the Company, 812 Broadway, N.Y.

THE Irish boil the potato "with a bone in it;" that is, they boil the tuber so as to leave a small, hard spot in the middle. Most people prefer to boil the flavor out of the tuber.....

POTATOES IN NEW COUNTRIES.—Old settlers tell marvelous stories of the prices obtained for potatoes in the days of the mining excitements in California and Colorado. The miners, living almost entirely upon salt meat and flour, were seriously troubled with land scurvy. Potatoes were found to be a corrective, and often sold for enormous prices. Many farmers made more at digging potatoes than the miners made at digging gold. In most new countries at the present time, potatoes are found to be a very profitable crop. In the great wheat-growing regions of the West, where most farmers rush into the cultivation of the staple grain, a few acres of potatoes always find ready sale at good prices. The same is true of the corn-growing countries, or even in the "cotton belt." It is the "odd" crop—the one not generally raised by the neighbors, that brings the most money. In the forests of Northern Michigan are found hundreds of small farmers who cultivate a few rough acres, that they have hacked out of the forest. These find the potato a most profitable crop. The tubers are sold for use in the lumber camps, where, on a ration composed for the most part of bread, pork, beans and potatoes, men perform the roughest and hardest labor known.

SEND IN YOUR SUBSCRIPTIONS.

Address the RURAL NEW-YORKER, 34 PARK ROW, NEW YORK.

A SPECIAL OFFER.

WE WANT EVERY RURAL FAMILY to raise a supply of small fruits, and to induce them to set a plot *this Spring*, we make this special offer to any present subscribers for 1886. For *one new* subscriber you may select:

Twelve Marlboro Raspberry Plants; or,
Twelve Rancocas Raspberry Plants; or,
Six Golden Queen Raspberry plants; or,
Three Earhart Ever-bearing Black-cap Raspberry Plants: or,
Eight Jewell Strawberry Plants; or,
One Poughkeepsie Red Grape-vine; or,
One Ulster Prolific Grape-vine.

For *two new* subscribers you may select any three of the above lots, or a two-year-old Niagara Grape-vine.

For *three new* ones you may select any three of the first seven lots and a two-year-old Niagara Grape-vine.

BETTER YET.

For *four new* subscribers, you may select *five* of the first seven lots, and in addition we will make you a special present of an extra nice two-year-old Niagara Grape-vine. The Niagaras, in every case, will be direct from the Company, and under seal. The other plants will be direct from the originators, and guaranteed genuine, and delivered free of charge. Any person not already a subscriber, can take advantage of any of these offers by adding his own subscription to the numbers herein specified.

To purchase these plants and pay freights on them, would cost more than we charge for the RURAL, with the plants included.

For instance:

Five lots of plants and freight included,	$10.00
The extra Niagara vine and freight,	2.50
Amounting for plants and freight,	$12.50
The five copies of RURAL,	$10.00
Making	$22.50

All of which we send for the $10.00; beside the free seeds to such as ask for them.

By a judicious selection of plants, and good care in growing and propagating them, in a single season you could supply the whole club with each sort. It is respectfully submitted whether these offers are not very liberal?

POTATO SPECIAL.

(*Continued from page 39.*)

results. The exceptions are when a June drought occurs (which is not common), and with the Peachblow variety which does best planted about the first of June. As we cannot foretell a drought, I plant all varieties but the last named early—in April if the weather permits. I grow the larger part of the crop with no manure except sod; I have never used commercial fertilizer with the crop, but I prefer well-rotted stable manure applied after the land is plowed and well mixed in by harrowing.

For my earliest planting, where there is danger of freezing, I fill the furrow with partly rotted manure after the seed is dropped, and put an inch or two of earth above. it. I think there is no crop which gives better returns for manure than potatoes. I find on our upland clay soils, that moderate hilling is better than flat culture, as there is less danger of the land becoming compacted by heavy rains; but on sandy, loose soil I should cultivate as level as possible. The first cultivation is with a harrow which fines and levels the surface and kills all the weeds that are starting; this should be done before the potatoes are up so as to be seen in the rows. If rains form a crust and start the weeds, a second, or possibly a third harrowing may be necessary, for the cultivation should be such as will keep down the weeds and keep the surface level until the plants are four inches high. At this stage we use a small bar or turning plow, running as closely to the row as possible and about four inches deep, turning the earth away from the plants. This stirs thoroughly all the soil except a strip four or five inches wide right in the row, and it cracks and mellows that. Within a week or less, according to the weather, we run through the rows with a cultivator, leveling the ground and bringing the earth back to the plants, and we cultivate often enough to keep them clean and the earth mellow until they fall and cover the ground, by which time we have them hilled about four inches. After they fall we go through with hoes, if necessary, and take out any weeds that start. Most farmers do nothing more after the vines fall, and as a consequence enough weeds grow to obstruct digging, and to seed the land for years to come. Usually less than a day's work to the acre will keep the crop clean, and if it took twice that time, it would pay.

It is now more that 20 years since blight or potato rot has prevailed to any great extent in my locality, and the only enemy which we consider worth noticing is the beetle. Nine years out of ten I use no remedy for it, but depend on such soil and cultivation as will give a thrifty plant, and find that the bugs do not harm the crop. In ordinary seasons I do not think it is reduced in yield one per cent. by the Colorado Beetle. The exception is when a dry and unfavorable Spring gives a plant of reduced vitality, and then we find it necessary to use Paris-green. I prefer to apply it in solution, as I think it more economical and effectual than in powder. I have been troubled with scab only on a few varieties, and these I have discarded.

I practice hand digging, unless the price of potatoes is very low, for I have never tried a machine for digging, that would not leave enough covered up to pay for digging if potatoes were worth 50 cents or more a bushel. We use both the fork, spade and potato hook, some preferring one, some the other. We always assort as we pick up: our plan is to first gather up all the marketable potatoes and as we do this, the rest are thrown into piles ten feet apart in every third row. This saves going over all the ground a second time. If possible, the potatoes should be taken at once to where they are to be kept, as every handling adds to their cost. As soon as picked up, pour them into sacks, filling them only half full; the sacks then will not need to be tied to load them on the wagon, and one man handles them with ease, and with a man in the wagon and two on the ground 40 bushels can be loaded or unloaded in less than five minutes. If your potatoes must be left in the field awhile, build a board shanty for them. Lay a smooth floor so that the scoop-shovel can be used when you come to rehandle them. I estimate that less than 1,000 feet of lumber will make a shed that will hold 1,000 bushels. If they are put in piles or into a shed with an earth floor, it will cost two cents a bushel to pick them up by hand, while to fill them into sacks with a scoop-shovel will not cost more than a quarter of a cent. If the assorting has been done in the field, after the large potatoes have been picked up, I go over the piles and make my selection for seed, and what are left are taken to the barn cellar, unless I can sell them to the bakers. If I can get 15 cents or more a bushel for them, I always sell.

The most profitable way to feed them is once a day to the cattle, giving from four to six quarts to each. I find they increase the flow of milk and keep the stomach and bowels in good condition. I think they are more valuable fed in small quantities in this way as a condiment, than when fed in large amounts.

I prefer to pit my seed potatoes, and also such as I intend to keep for a spring market. Select a piece of land that slopes so as to carry off all surplus water, remove the earth eight or ten inches deep and four feet wide, and throw it at the sides to be used in covering. Then pour your potatoes in a ridge with the sides sloping at an angle of 45 degrees, set up corn fodder against the sides nearly a foot thick—straw will answer, but I prefer fodder—above this put 18 inches of soil, and then, before the cold weather, cover the outsides with coarse manure, straw or fodder. I usually build a fodder stack over the pit, and in the Spring, find the cattle eat it well when taken to the barn-yard. Whatever material you use, be sure the potatoes are protected so as to endure any degree of cold. Great losses occur every year from carelessness in this respect. There is no farm product which it is so difficult to tell when the best time is to market: but as the time to sell in Spring is very short until new potatoes are in the market, and the potatoes shrink in weight, and deteriorate in quality, every day after Spring opens, it is wise to sell the bulk of the crop in the Fall, if a fair price can be had. I always sell the bulk of the crop if I can get from 45 to 50 cents a bushel.

I have never known a farmer to engage in potato growing and stick to it, who did not make money; and if he is thorough in the preparation of the soil and cultivation of the crop, he will find the seasons of short crops his years of greatest profit; for in these years the poor, slovenly farmer will fail entirely and the increased price will make the crop, though smaller than usual, bring the most money. I find it easier to grow 100 bushels of merchantable potatoes to the acre than 50 bushels of corn, and think a bushel to the square rod fairly within reach of the good farmers, and here in Ohio, it is rarely that potatoes sell as low as corn, and they are often double the price. I think the best rotation for potatoes is to follow with wheat and sow clover with the wheat, and then if the land is in good condition, and the clover not pastured at all in the Fall, it may be put in potatoes again the next year; but if allowed to stand in clover a year, I would not pasture closely, as a heavy growth of clover to shade the land and kill out the weeds, is desirable. If stable manure is used with the potatoes, a very heavy crop of wheat can usually be grown, and there will be a growth of clover in the Fall, that will insure a big potato crop without manure.

In early varieties of potatoes it seems as though our experimenters had nearly reached perfection; but in my judgment we need more varieties of late potatoes with the good points of the Peachblow and the fine table qualities of the best early kinds. The Peachblow is superior to any variety I ever grew in withstanding drought and in growing a profitable yield on thin, worn soil. On our loamy clay, which withstands drought well, I have never known this variety killed by dry weather; but it remains green until the fall rains, no matter how late they are in coming, and then the crop makes very quickly and 100 bushels to the acre can be grown without manure on land that would not pay for cultivating if planted in the quick-maturing varieties. Another advantage of varieties which, like the Peachblow, may be planted in June, is that a heavy growth of rye or clover can be made and turned under before planting time, which not only furnishes plant food, but also keeps the land loose and moist through drought. We need more late varieties because a drought which greatly injures the early crop, is invariably followed by rains which will insure a good yield to a late maturing one, and I suggest the Peachblow as one of the parents of new late varieties.

Butler Co., Ohio.

THE RURAL'S POTATO TESTS.

THE results of the RURAL'S tests of new potatoes are given below in a condensed form for the benefit of those who are seeking to compare new varieties. Our older readers will understand the condition of soil, cultivation and fertility under which these tests are made. To our newer readers we may say, in brief, that the soil on which these tests are made is a moist, mellow loam, a little inclined to clay. Concentrated potato fertilizers are used at the rate of 1,200 pounds to the acre. The tubers are planted in trenches five inches deep and covered, first, with an inch of soil and then with the fertilizer, after which the trench is filled up with earth to the surface. The surface is never hilled up, but kept as level as possible. Cultivation is done with wheel cultivators and hoes.

WALL'S ORANGE.—Oblong, sometimes roundish-oblong, always flattened; skin buff, splashed with purple; purple eyes; yield, rate of 506.66 bushels; quality fair.

EARLY OHIO.—Seven to ten days earlier than Early Rose and its equal in quality; rate of 300 bushels.

EARLY SUNRISE.—Oblong; white skin, sometimes pinkish, with superficial eyes. dug Aug. 19; rate of 250.33 bushels; flesh white; excellent—dry and mealy.

QUEEN OF THE VALLEY.—Skin white, mottled; eyes not deep; dug Sept. 3; rate of 556.60 bushels; flesh white; fairly dry and mealy.

AMERICAN GIANT.—Flesh nearly white; shape variable; rate of 484 bushels; dry and mealy—as good as Early Rose.

PARSON'S PROLIFIC.—Roundish; rather irregular; eyes superficial; white skin; dug Sept. 27; rate of 537.75.

BROWNELL'S BEST.—Rather long, roundish; white skin, russeted; flesh white; rate of 684.42 bushels; dug August 28; dry and mealy; vines not vigorous.

NEW CONQUEROR.—Roundish-flat; rate of 414.75 bushels; dug August 28; tasteless; quiet dry and mealy.

ST. PATRICK.—Long; flesh white; rate of 524.33 bushels; dug Sept. 3: tasteless; not so mealy as some.

WHITE STAR.—Uniform, smooth; white; rate of 556.60 bushels; dry, mealy, tasteless; dug Sept. 3.

BURBANK'S SPORT.—Uniformly good shape; white skin; eyes superficial; rate of 429 bushels; dug Sept. 3; not quite dry or mealy.

BROOK'S SEEDLING.—Somewhat irregular; skin pinkish; flesh yellowish; rate of 566.50 bushels; dug Sept 18; quality best.

WONDER.—Roundish; flattened; russet-like skin; purplish about eyes; white flesh; rate of 205 bushels; not tested.

CHAUTAUQUA BEAUTY.—Long, tapering to one end; many eyes, not sunken; skin white, pink about eyes, slight purplish line under skin; rate of 206 bushels; best quality.

FAULTLESS.—Uniform; close together; skin buff and red; rate of 414.70 bushels; floury, dry, mealy and good.

WYSOR'S PEACHBLOW—White skin; yellow flesh often splashed with red; rate of 403.33 bushels; quality excellent.

MAMMOTH PEARL—Roundish, flat; light skin; rate of 514.21 bushels; "watery."

BELLE.—Skin buff and rose-colored; rate of 436.92 bushels.

MATCHLESS.—Roundish, flattened, smooth; white skin; rate of 411.44 bushels; quality best.

WAVERLY.—Shape of Beauty of Hebron; few eyes on surface; pinkish skin; rate of 326.70 bushels; dry and mealy.

INDIANA.—Oblong; deep purple, with buff streaks and blotches; rate of 473 bushels.

ROSE'S NEW SEEDLING.—Eyes superficial; oblong; regular; rate of 373.04 bushels; white, mealy, excellent.

FLORENCE.—Roundish, small; white skin; eyes not sunken; rate of 221.83 bushels; rather soggy.

EARLY HOUSEHOLD.—Fine shape; white skin; rate of 346.90 bushels; good quality.

PALISADE.—Long and tapering; white skin; rosy in some places; eyes on surface; rate of 161.33 bushels; quality excellent.

HAYNES' SEEDLING.—Buff skin, running to pink in places; rate of 393.21 bushels.

EL PASO.—Roundish; close in hill; skin buff; eyes rather deep; intermediate; rate of 438.60 bushels; early in season; flesh white and mealy. Later, yellowish white; not mealy.

JORDAN'S PROLIFIC.—Intermediate; skin light; numerous, not deep eyes; rate of 432.50 bushels; very good.

WINSLOW SEEDLING.—Skin rosy; eyes not deep; rate of 584.83 bushels; in shape and quality like Early Rose; later in maturing.

EARLY GEM.—Shape of Early Rose; early; rate of 695.75 bushels; best quality.

ARUNDEL ROSE.—Rose skin; eyes as in Early Rose; quite late; rate of 580.80 bushels, white flesh; mealy; mild flavor.

DAKOTA RED.—Oblong; irregular; flattened; skin, rose-pink or light purple; prominent eyes; rate of 314.60 bushels; flesh dark; not best.

MAYFLOWER.—Smooth and shapely; twice as long as wide; nearly white; eyes on surface; rate of 544.50 bushels; mealy and dry; flesh nearly white.

CRAWFORD'S EARLY.—Not uniform; early as Early Rose; white; rate of 383.17 bushels; dry and mealy.

PRIDE OF THE WEST.—Round and solid; white; rate of 382.30 bushels; dry and mealy. Same on heavy soil.—Intermediate; light buff skin; few eyes, not deep; rate of 760.46 bushels.

DUNMORE.—In clayey soil—roundish-oblong flattened; skin white; eyes not deep; rate of 532.40 bushels; flesh white; not quite dry or mealy.

JEWEL.—Roundish, flattened; skin white; eyes not deep; rate of 539.44 bushels; rather dry and mealy—heavy soil.

VERMONT CHAMPION.—Intermediate; oblong; slightly smaller at one end; white flesh; few eyes on surface; rate of 292.38 bushels; fine quality; good keeper.

NORTH STAR.—Roundish-flattened; large eyes; buff skin, splashed with purple; rate of 720.50 bushels; not very dry; quality very good.

LADY-FINGER.—Long and cylindrical; tapering at either end; eyes so set as to give a surface of little hills and valleys; skin buff-white; rate of 336 bushels; flesh yellow and inferior.

VICK'S EXTRA EARLY.—Roundish, oval flattened; skin white, smooth; often russeted; eyes nearly upon the surface; form and appearance perfect; dug July 20; rate of 370.55 bushels.

PEARL OF SAVOY.—Uniform in size and shape; skin, color of Early Rose; eyes not prominent; dug July 29; rate of 699 bushels.

JONES' PRIZE-TAKER.—Like Early Rose, with whiter skin; quite early; flesh, yellowish-white; quality, best.

WEST'S SEEDLING.—Smooth and shapely; eyes not deep; light buff skin; quite early; full-grained and breaking, but not quite dry.

HELTZEL SEEDLING.—*White*; shape of Early Rose; straggling in hill; early; flesh dark, not dry.

SAME.—*Red*; long-round, rather deep; many eyes; light purple skin, with streaks of buff; quite early; later than white; dark flesh; dry, nutty.

LADY FRANKLIN.—Late; oblong; not much flattened; eyes not deep; rate of 450.38 bushels; flesh not quite white; splendid keeper.

MERCER.—Flat-oblong; purple, with deep purple eye; rate of 484 bushels; flesh yellowish; excellent.

HODGMAN'S SEEDLING.—Skin white; eyes not very deep set; angular and somewhat flattened; rate of 1,361.25 bushels; yellowish-white flesh; not very dry or mealy.

GREEN MOUNTAIN.—Short and chunky, flattened and not very regular; skin nearly white; eyes depressed; rate of 1,391.50 bushels; flesh nearly white; coarse, dry and mealy; dug August 27.

EARLY MAINE.—Color of Early Rose, sometimes a deeper pink about the eyes; cylindrical—egg-shaped; rate of 616 bushels; dug August 19; flesh nearly white; mealy and good.

TREMONT.—Round-oblong—sometimes flattened; few eyes on surface; dug August 8; rate of 617.10: white flesh; quality fine.

UNDERWOOD No. 34.—Flesh nearly white;

eyes not deep—few; rate of 907.50; dug August 23; neither dry nor mealy on most soils.

SEEDLING.—From H. B. Williams; skin buff, inclined to pink; few eyes, not deep; white flesh; rate of 726 bushels; dug August 19: quite mealy.

CARNIVAL.—Irregular; skin mottled; buff and pink; flesh nearly white; quality fair.

SEEDLING OF EARLY OHIO.—Dark skin; from W. H. Cook; color of Early Ohio; flesh nearly white; rate of 564.66 bushels; dug August 4; quality not very dry.

SAME.—Light skin; oblong-cylindrical; rate of 561 bushels; flesh nearly white; dry and mealy.

MONTREAL.—Irregular shape: buff skin; eyes rather deep; large average size: dug Sept. 3; rate of 1,189.84 bushels; flesh nearly white; dry and very good.

ALEXANDER'S EARLY EXTRA.—Roundish-flattened; eyes few and prominent; rate of 544.50 bushels; dug August 15; not dry.

LATE HOOSIER.—Cylindrical; skin buff-pinkish about eyes, which are deep; flesh white; rate of 860.42 bushels; dug September 17; strong vines; fair quality.

POTENTATE.—Roundish-flattened—hollow at ends; few eyes, not deep; skin like Beauty of Hebron; white flesh; rate of 645.32 bushels; dug August 4; mealy and good.

BONANZA.—Quite shapely; eyes a little deep; skin rosy; rate of 786.50 bushels; dug August 18; quality fair.

GUELPH.—Roundish or oblong; eyes not deep; skin buff-white; rate of 421.67 bushels; dug August 22; quality fair.

HALTON.—Round cylindrical; eyes rather deeply sunken—though variable: skin pinkish; often russeted; rate of 524.33 bushels; flesh yellowish; dry and good.

CREAM OF THE FIELD.—Irregular cylindrical; often prongy: buff skin; eyes rather sunken; flesh yellowish; rate of 1,075.55; dug September 3; late intermediate; excellent.

STALWART.—Oblong, often tapering; buff-white skin, often russeted; eyes not deep.

NORTH STAR.—Skin buff, streaked and banded with purple; eyes rather deep; irregular, large at one end; flesh white; rate of 453.75; dug August 19; quite mealy.

BOUCK'S SEEDLING.—Oblong, somewhat egg-shaped; skin and flesh white; eyes on surface; late intermediate; mealy and good.

HOME COMFORT.—Irregular and ill-shapen; skin pink; eyes prominent and depressed, making surface hilly; rate of 968 bushels; dug Sept. 8; flesh yellowish; sweet and mealy.

SUPERLATIVE.—Irregular; eyes not prominent; buff and white skin; flesh nearly white with dark spots when cooked; rate of 872.25 bushels; dug Sept. 8; not dry or mealy.

Continued on Supplement, page 41.

For Women.

CONDUCTED BY MISS RAY CLARK.

A LAWYER'S SOLILOQUY.

I HAVE sat in my office all day,
And thought, and studied and planned;
I have rents and accounts I must pay,
And I've nothing to pay with on hand.

The lawyers having plenty to do,
And money at interest beside,
Are the ones where the clients all go,
When e'er a good case they 'll have tried.

I have always been honest and pure,
And never have championed the base,
And candidly hoped I'd secure,
My share of the business at least.

It is something I can't understand,
That my honesty all do commend,
While business they'll keep from my hand,
And to some trickster's office they'll send.

I have a wife and four children to feed,
And to clothe as becometh our station,
Many things we actually need,
While the future gives no consolation.

A small house I now own it is true,
But 'tis mortgaged for a thousand or more,
Our furniture—'tis simply not new,
And we owe several bills at the store.

I have waited and struggled and worked,
And hoped a good practice to gain,
While my efforts dame fortune has mocked,
And has duped me again, and again.

Now, had I my talents employed
At farming, mechanics, or trade,
And my foolish ambition destroyed,
A home for my family I'd made.

The money for study expended,
For library, clothing and board,
And getting admitted and started,
Would buy a farm fit for a lord.

I am sorry I did as I did,
My life I believe I have wasted,
On a farm I wish I had staid,
Where want we ne'er would have tasted.

C. L. N.

THE NEW YEAR.

THE practice of making good resolutions at the beginning of a new year is often ridiculed because the resolutions are too often forgotten before six weeks of the year have passed. But the practice is not a bad one.

Every one has a greater or less number of good resolves that enter his or her heart from time to time and only wait some good opportunity to be put into practice. The first of the New Year, if set apart as a time to think of good resolutions, will see these crystalizing into practical results. None will be made poorer by making a new effort in some wise direction. Not only may the overcoming of faults be put on a list of changes for the new year, but branching out into some new department of study or work ought to be included.

There are always obstacles in the way of a new venture of any sort, often many unexpected and trying ones, but these once overcome, the tide turns, and circumstances become helpful where at first they hindered. Expect opposition, discouraging times, and even partial failures, and prepare to meet them all with an unflinching, persistent determination to reach final success.

Does this sound like too much earnestness to put into New Year's resolves? If faults are to be overcome, the fight may last all the year; but what of it if victory crowns its close? I once heard the story of a woman's conflict with her temper, and it has encouraged me so often I will tell it briefly. She was a neat, careful housewife and her husband and children gave her occasion for scolding every day, by carelessly leaving scattered about hats, boots, books and numberless other things, and she never failed to scold them sharply. One day her husband retorted that "she was growing to be as great a scold as Aunt Lizzie Rixon," a woman whose scolding tongue made her the dread of half the country round. Without one word she went to her room and locked herself in, and all day long looked over her shortcomings, at first angrily and bitterly, then so despairingly that she almost wished to die. But at last a little grim hope led her to resolve to conquer her temper, and as an aid and a reminder she promised herself she would never reprove the children in a voice above an undertone.

She adhered to her resolve, and was often reproached and grieved to see how surprised the children looked when she gently gave them a word of reproof. Sometimes it took all the patience she could muster to see her husband throw his hat on the floor, his coat on one chair and his bundles on another, when he came in from business, and to leave them there, for the mere act of removing them would be done, she knew, in a spirit of reproof, if she allowed herself to touch them before her indignation subsided. And so she fought, and conquered her temper, and, in time, succeeded in training her boys and girls to adopt her own neat ways, and "papa's things" were always picked up by some of the little folks, and it became their pleasant task to meet him at the door and help him dispose of coat, hat and bundles.

What fault is most troublesome to yourself and your friends? Measure its strength now, and begin your fight with it for the New Year.

If it has long been an unexpressed wish that more time could be given to music, reading or study plan for it now. Begin with easy music and small volumes, simply written, and advance to larger tasks as the smaller ones are finished.

It may be in a family of girls, one has long intended to learn dress-making, that she may lessen the expenses, and also to fit herself to earn her own livelihood, if that should ever become necessary. Do this the coming year, if it seems a wise thing after further thought.

Dreams may be have been indulged of changing the plain, dingy, second-story room into a bright, attractive place, by the use of a little money, more time, and considerable "mother wit." Let those dreams become realities during the coming year.

Keeping accurate account of household expenses, cannot be begun at a better time than on the first of January—or personal expenses, both are of profit and interest. Many things can be commenced with the New Year. Each one can best determine what these are; but let there be something in each life to make the years, as they come and go, better and brighter. ALICE BROWN.

CONCERNING WINTER EVENINGS.

MUCH has been written of late on the subject of self-culture, home study and private courses of reading, and yet, notwithstanding, the whole is considered in general as a mere theory, and when the boy or girl leaves school, they shut up their books, content never to open them again. Men and women read, it is true, more or less. The majority find time to peruse the weekly paper, and occasionally a "good story," or a spicy magazine article. This is the ordinary literary pastime of many an intelligent farmer and farmer's wife, and even of many young people, whose long, winter evenings drag heavily on their hands, unless entertained by a chance caller, or some similar diversion. What shall we do with our winter evenings? This is an important question, and one to which various answers are given. Some young people manage to spend the majority of them among their friends, or at some place of amusement, while the remainder are passed in a very unsatisfactory manner at home. Lawful pleasure and enjoyment is a necessary part of human life, yet pleasure-seeking is by no means the end and aim of our existence, and when in such a position, we at once perceive the evil results, by that restless discontent that takes possession of us the moment our fund of pleasure is exhausted, and by the eagerness with which we look forward to another opportunity to gratify our inclination. If we only appreciated the value of these precious hours frittered away in senseless gaiety, realized that they were portions of the brief space of existence allotted to each of us, and that every hour is an opportunity presented but once in a lifetime for raising ourselves to a higher and nobler plane of existence. I say if we realized aright this fact, how much of regret might be spared us in after years. I do not desire to be considered as an enemy to lawful amusements, or as waging an indiscriminate warfare against innocent social pleasures, but only against the abuse of certain forms of either, against a tendency to make pleasure and amusement the chief business of the winter season.

But this is only incidental; our question is, how can these evenings, and spare hours in general be profitably employed? First let us see what they amount to in the aggregate. Counting four evenings per week, and three hours each evening for, let us say, 18 weeks, we find this is together equivalent to 216 hours. This at least can be considered a fair estimate of leisure hours at the disposal of most young people who are fortunate enough to have a comfortable country home, how much valuable information might be acquired every Winter by devoting this time to mental improvement! You may have had an excellent education in earlier years, yet there is much to learn, and the way is made all the easier by your previous habits of study. Or perhaps your education may have been defective; all the more reason then to retrieve what is not yet hopelessly lost. Never let the idea that you have education enough for a farmer or a farmer's wife keep you back from every possible endeavor to cultivate your mental powers. Remember that your occupation is not yourself, that labor with the hands does not degrade the man or woman, but that the benefits of a liberal culture will come to you as a farmer or mechanic, or housewife as much as though you occupied a higher position in the estimation of men. Again, do not allow your circumstances to influence you greatly in this matter. Knowledge is knowledge however acquired. A regular course of instruction under competent teachers is valuable, and yet very much may be gained by your own unaided efforts and diligence. What cannot the 216 hours rightly used accomplish in this direction? This may be answered from experience, if you care to make the trial. And here a little caution is necessary. Do not attempt too much. Concentrate your efforts largely in one direction. Much valuable time is lost by reading without order or system. Choose some subject which you desire to learn. Master first an outline of the subject, then you are prepared to branch out into details. Cultivate the habit of attention. Do not be afraid to *study*, and even memorize important points. Do not let reading take the place of study, but rather the opposite. This is the safest at first. Valuable works in history and science may now be purchased at a price which leaves no excuse for ignorance.

These hints and suggestions have been hastily thrown together as a result of wide observation and experience, and I trust that they may be useful to some reader of the RURAL. We have only to appreciate the value of our opportunities, in order to realize the duty of improving them. HOLLY DEAN.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

NOTES.

THE results of the average cook are such as to make one wonder if a well-boiled potato is a thing purely ideal.

As potatoes are a standard article of food on most tables, try to serve them in as many palatable ways as possible.

Put potatoes on to boil in *hot* water. When done, drain off every particle of water, place on the side of the range for a few moments with the cover a little to one side to allow of the escape of steam, replace cover, shake or toss gently and serve at once.

As the best part of the potato lies nearest the skin, it is imperative that the peel taken off should be thin.

SOUPS.

NO. I.

I HAVE no exact measurements for this soup, as it is sometimes intended for a small family, and sometimes for a large one, but I find the following rules a sufficient guide. Measure into the pot one teacupful of boiling water for each member of the family, and another cupful to allow for escape in steam, etc. In this cook one medium-sized potato for each cup of water. Pare the potatoes and cut them in thick slices or squares. When they are tender, add flour enough for thickening, first stirring it into scorched butter, adding only enough flour to the butter to make it batter-like; if too thick, it will float in lumps in the soup. A heaping tablespoon of butter is enough for three pints of soup. Add a slice or two of well browned toast broken up fine; season with pepper and salt, and serve hot.

A. B.

NO. II.

Boil three or four thin slices of salt pork in two quarts of water for half an hour. Have peeled six or eight good-sized potatoes, cut in three or four pieces. Boil these with the pork until they begin to fall in pieces. Then thicken with a couple of tablespoonfuls of flour and butter well rubbed together. Stir well and when it boils up, the soup is ready. Salt, pepper and butter may be used for seasoning, according to the taste. The pork should be boiled half-an-hour before the potatoes are put in, and any scum that rises must be removed. AUNT RACHEL.

NO. III.

One pound of salt pork, one dozen large potatoes, two onions, seasoning, a spoonful of butter, a cup of new milk, one egg, three quarts of water. Boil the pork in the water one and a half hour. The boiling should be moderate and water must be added from time to time to supply that which has evaporated. Take out the pork, add the potatoes after peeling and slicing and the onions minced, and boil gently for an hour. Stir often. Add the butter, a dash of pepper, beat the egg and stir into the milk and add by degrees to the soup. Boil up and serve. MRS. E. F.

NO. IV.

To four quarts of water add six large potatoes chopped fine, two minced onions, two pieces of celery cut into bits, and a half teacup of rice. Boil slowly, stirring to prevent burning, one hour. Just before taking from the fire, add a lump of butter the size of an egg, worked smooth in a spoonful of flour and a cup of thin sweet cream. Season and serve with bits of toast. COOK.

NO. V.

Three pints of strong stock (the water in which you have boiled two pounds of cheap beef, mutton or veal), an onion, 12 good-sized potatoes, two spoonfuls of rice, one quart of cold water, two spoonfuls of butter, seasoning. Peel and slice the potatoes, cover with boiling water and cook ten minutes. Turn off this water, cover with the quart of cold water, add the onion minced and cook until the potatoes boil to pieces. Pass with the water through a colander into the stock, cook gently half an hour, add butter, the seasoning and rice, which should have been boiled tender in a very little water. Simmer five minutes longer and serve. MRS. ECONOMY.

MASHED POTATOES.

ONE dozen good-sized potatoes washed, and pared as thin as possible, thus leaving all the starch which is near the surface; cut in two, put into a kettle of boiling water and cover closely;

Miscellaneous Advertising.

The American people are quick to appreciate a good article, which accounts for their consuming several millions of cakes of Ivory Soap the past year. Its sterling merits and moderate cost establish it permanently in every household where once tried.

Free of charge. A full size cake of Ivory Soap will be sent to any one who can not get it of their grocer, if six two-cent stamps, to pay postage, are sent to Procter & Gamble, Cincinnati. Please mention this paper.

cook till they can be easily pierced with a fork, which should be in about 20 minutes. Drain and place the kettle upon the stove to keep hot, and remove the cover to dry off the steam. Then sprinkle some salt over the potatoes, unless the salt has been put into the boiling water, and break them thoroughly with a fork. Add a half teacupful of sweet cream, or rich milk, and beat all together till the mass is as smooth as butter and as white as milk. Put it into a hot dish, shaping it into a nice pyramid and send to the table. To be eaten with butter or cream gravy. Very nice. MAY MAPLE.

NO. II.

When I want extra-nice mashed potatoes, I mash and season as usual, then break in two eggs, beat till light and puffy, then put in a white earthen baking dish, and bake in the oven till they are nicely browned on top. Serve in the dish they are baked in.

AUNT EM.

NO. III.

Mash as usual, heap upon a greased pie-tin, strew thickly with dry bread-crumbs, and then with small bits of butter and brown upon the upper grate of the oven. Slip carefully onto a hot, flat dish. KATE C.

NO. IV.

Mash, season, make into a cone shaped mass, cover with the whipped whites of two or three eggs (according to the quantity of potato), and brown delicately. The whites should be as stiff as for cake. A. E. M.

STEWED POTATOES.

CUT cold, boiled or baked potatoes into small pieces, add two or three hard boiled eggs which have also been cut into bits, a large spoonful of butter, salt, a pinch of Cayenne, and a large cup of milk. Heat through, careful in stirring to keep the pieces whole.

NO. II.

CUT cold boiled potatoes into dices, add a large lump of butter, salt and milk. Cook gently on back of range for twenty minutes.

COUNTRY GIRL.

OLD-FASHIONED FRIED POTATOES.

WASH, pare and slice very thin a dozen potatoes, more or less, according to the quantity desired, put them into a dish of cold water and let them stand a few minutes, or while you get the spider over the fire, with three or four spoonfuls of meat dripping. When hot, put in the potatoes, sprinkle with salt and pepper, cover closely and let them cook over a steady fire, stirring occasionally, that they may not burn, but brown evenly throughout; when tender, send them to the table. If well cooked, they are delicious though rather rich for dyspeptics.

MAY MAPLE.

FRIED POTATOES.

Peel the potatoes and slice thin, dropping them into cold water to prevent them from turning black. Have your skillet on the stove with a good bit of lard in it; when it is really hot, put in your potatoes, adding salt and pepper; cover closely, and put them where they will not burn. Let them cook thus about 15 minutes; then remove the cover, and let them cook faster, stirring well from the bottom very often with a knife. They should be a nice brown all through, and if rightly done will not be greasy.

I often cut the potatoes in small pieces, steam them, adding salt when I put them in the steamer, and after dishing them up, pour drawn butter over them, and turn them over with a fork; it makes a change in the taste which is agreeable. AUNT EM.

SLICED FRIED POTATOES.

Peel the potatoes and slice them in rather thin slices. Pour cold water over them, and let them stand an hour or more. Pour them into a colander to drain. Have ready on the stove the dish in which they are to be cooked, with two or three large tablespoonfuls of melted butter.

For a large family where quite a quantity is required, a long dripping-pan will be found convenient to cook them in. When the butter is hot, pour in the potatoes, and let them cook slowly on the top of the stove; sprinkle a little salt over them, and turn them often with a knife. As the grease is absorbed, add more that they may not burn fast to the pan. Let them cook until brown and tender—an hour is little enough time; for they need slow cooking to attain their best flavor. If but a small quantity is needed, the slices may be cooked singly in a dish, turning them when needed; but for a large dish, this would be too tedious. If butter is not available, lard that has been fried from salt pork will do; but butter gives the most satisfactory results. There is a sweetness about potatoes cooked in this way, which recommends them to every lover of this vegetable. AUNT RACHEL.

SALADS.

NO. I.

CHOP cold boiled potatoes fine with enough raw onion to season nicely. Make the following dressing to pour over, then set aside until time to serve. Rub very smooth the yelks of two hard-boiled eggs, add a teaspoonful of mustard, one of salt, the yelks of two raw eggs, a teaspoonful of sugar and a dash of Cayenne. To this mixture add sweet oil poured in by very small quantities beating all the time as long as the mixture thickens, then add vinegar little by little until as thin as desired. This dressing is very nice for cabbage.

NO. II.

Slice thin, cold boiled potatoes, put a layer in a salad dish. Cover with thin slices of hard-boiled egg, and strew with bits of pickled onion. When you have enough thus prepared, pour over a dressing made in the proportion of one tablespoonful of vinegar to three of salad oil (melted butter will do) one spoonful of salt to half the quantity of pepper and a teaspoonful of made mustard. Mix the salt, pepper, mustard and oil together, then add the vinegar very slowly, stirring fast.

MRS. B. WILSON.

PIES.

NO. I.

A coffee cup of grated raw potato, one quart of sweet milk, three beaten eggs, one large cup of sugar, a pinch of salt, cinnamon or nutmeg. Put the milk on to boil before grating the potato. As soon as the milk boils, stir in the grated potato. When cool, add the beaten eggs, then the sugar and seasoning. Bake with only an under-crust. This will be filling enough for two small pies. A. E. M.

NO. II.

One pound of warm mashed potatoes rubbed through a colander, two scant cups of white sugar, one-fourth pound of butter, six eggs, the whites and yelks beaten separately, juice of a small lemon, nutmeg or cinnamon. Cream the butter and sugar, add the potato, then the lemon juice, the yelks, seasoning, and, last, the whites. Bake without upper crust. Sufficient for two pies. Eat cold. Nicest eaten the same day as baked.

MARY B.

NO. III.

Ingredients for one pie: One cup of warm, not hot, mashed potatoes, one cup of sweet milk, two beaten eggs, one-half cup of sugar, a pinch of salt, nutmeg, cinnamon or lemon. Mix potato and milk to a smooth mass free from lumps, add eggs, sugar and seasoning. Pour into a pie-tin lined with pastry. Bake in a moderate oven. MRS. E. A.

DIFFERENT WAYS OF COOKING.

POTATO CAKES.

Take cold mashed potatoes, mix two beaten eggs with them, season if necessary, flour the hands and make into oblong cakes. Fry in beef-drippings and butter. Turn carefully when browned on the under side. "A."

POTATOES AND BEETS.

An excellent cook told me not long since that she boiled blood beets until they were tender, mashed them fine and mixed them with freshly boiled potatoes, and when seasoned with salt, pepper and butter, found them an agreeable change from the usual way of preparing both. AUNT RACHEL.

POTATOES WITH CHEESE SAUCE.

Boil 12 good-sized potatoes, mash, add seasoning, milk and butter. Make a cup of drawn butter (milk, butter and a very little corn-starch as thickening, with pepper and salt), into it stir two beaten eggs, and two spoonfuls of dry grated cheese. Put a round layer of potato into a pie-tin, cover with a thin layer of the drawn-butter sauce, cover this in turn with the potato, and so on until you have a mound, cover with the sauce, strew thickly with grated cheese, and brown in a quick oven. MRS. D.

POTATOES IN CASES.

SELECT large potatoes of equal size; when done, take from the oven and cut off a small piece from the top of each, scoop the inside out carefully with the aid of a small spoon; season liberally with butter, pepper and salt, and return with the spoon to the skins, allowing the mashed potato to protrude about an inch above the skin. When enough skins are filled, use a fork to make rough the potato that projects, and set in the oven to color the tops. These have the appearance of baked potatoes burst open.

POTATOES BAKED WITH MEAT.

PARE potatoes of same size, put them in the same pan in which roast-beef or poultry is baking. Every time the meat is basted, the potatoes should be basted also. Serve them around the beef. MRS. C.

BOOKS FOR THE MILLION

MARVELOUS PRICES!

COMPLETE NOVELS and other WORKS by FAMOUS AUTHORS, almost GIVEN AWAY.

To open at once a direct trade with the reading public, we have decided to offer this list of books at prices which are far below those usually charged to newsdealers at wholesale. If you buy these books at a store, you have to pay the dealer a profit to cover his rent, clerk hire and expenses. Save this by ordering direct of headquarters, and get the books delivered at your P. O. for half the price you could buy them for. Send us a small order if only to see how low books can be sold. These are published in neat pamphlet form, many of them handsomely illustrated, and all are printed from good type upon good paper. They treat of a great variety of subjects, and we think no one can examine the list without finding therein many that he or she would like to possess. In cloth-bound form these books would cost $1.00 each. Each book is complete in itself.

1. The Widow Bedott Papers. This is the book over which your grandmothers laughed till they cried, and it is just as funny to-day as it ever was.
2. Fancy Work for Home Adornment, an entirely new work upon this subject, containing easy and practical instructions for making fancy baskets, wall pockets, brackets, needle work, embroidery, etc., etc., profusely and elegantly illustrated.
3. Grimm's Fairy Stories for the Young. The finest collection of fairy stories ever published. The children will be delighted with them.
4. The Lady of the Lake. By Sir Walter Scott. "The Lady of the Lake" is a romance in verse, and of all the works of Scott none is more beautiful than this.
5. Manual of Etiquette for Ladies and Gentlemen, a guide to politeness and good breeding, giving the rules of modern etiquette for all occasions.
6. The Standard Letter Writer for Ladies and Gentlemen, a complete guide to correspondence, giving plain directions for the composition of letters of every kind, with innumerable forms and examples.
7. Winter Evening Recreations, a large collection of Acting Charades, Tableaux, Games, Puzzles, etc., for social gatherings, private theatricals, and evenings at home; illustrated.
8. Dialogues, Recitations and Readings, a large and choice collection for school exhibitions and public and private entertainments.
9. Parlor Magic and Chemical Experiments, a book which tells how to perform hundreds of amusing tricks in magic and instructive experiments with simple agents.
10. The Home Cook Book and Family Physician, containing hundreds of excellent cooking recipes and hints to housekeepers, also telling how to cure all common ailments by simple home remedy.
11. Manners and Customs in Far Away Lands, a very interesting and instructive book of travels, describing the peculiar life, habits, manners and customs of the people of foreign countries; illustrated.
12. Sixteen Complete Stories by Popular Authors, embracing love, humorous and detective stories, stories of society life, of adventure, of railway life, etc., all very interesting.
13. The Budget of Wit, Humor and Fun, a large collection of the many stories, sketches, anecdotes, poems, and jokes that have been written for some years; illustrated.
14. Useful Knowledge for the Million, a handy book of useful information for all, upon many and various subjects; illustrated.
15. Called Back. A Novel. By Hugh Conway, author of "Dark Days," etc.
16. At the World's Mercy. A Novel. By Florence Warden, author of "The House on the Marsh," etc.
17. Mildred Trevanion. A Novel. By "The Duchess," author of "Molly Bawn," etc.
18. Park Days. A Novel. By Hugh Conway, author of "Called Back," etc.
19. The Mystery of the Holly Tree. A Novel. By the author of "Dora Thorne."
20. Shadows on the Snow. A Novel. By B. L. Farjeon, author of "Bread-and-Cheese-and-Kisses," etc.
21. The Gray Woman. A Novel. By Mrs. Gaskell, author of "Mary Barton," etc.
22. The Frozen Deep. A Novel. By Wilkie Collins, author of "The Woman in White," etc.
23. Red Court Farm. A Novel. By Mrs. Henry Wood, author of "East Lynne," etc.
24. In Cupid's Net. A Novel. By the Author of "Dora Thorne."
25. Back to the Old Home. A Novel. By Mary Cecil Hay, author of "Hidden Perils," etc.
26. John Bowerbank's Wife. A Novel. By Miss Mulock, author of "John Halifax, Gentleman," etc.
27. Lady Gwendoline's Dream. A Novel. By the author of "Dora Thorne," etc.
28. Jasper Dane's Secret. A Novel. By Miss M. E. Braddon, author of "Aurora Floyd," etc.
29. Leoline. A Novel. By Mary Cecil Hay, author of "Brenda Yorke," etc.
30. Gabriel's Marriage. A Novel. By Wilkie Collins, author of "No Name," etc.
31. David Hunt. A Novel. By Mrs. Ann S. Stephens, author of "Fashion and Famine," etc.
32. Reaping the Whirlwind. A Novel. By Mary Cecil Hay, author of "Old Middleton's Money," etc.
33. Dudley Carleon. A Novel. By Miss M. E. Braddon, author of "Lady Audley's Secret," etc.
34. Essien; or The Mystery of the Headlands. A Novel. By Eva W. Pierce, author of "The Birth Mark," etc.
35. A Golden Dawn. A Novel. By the author of "Dora Thorne," etc.
36. Valerie's Fate. A Novel. By Mrs. Alexander, author of "The Wooing O't," etc.
37. Sister Rose. A Novel. By Wilkie Collins, author of "The Woman in White," etc.
38. Anne. A Novel. By Mrs. Henry Wood, author of "East Lynne."
39. The Laurel Bush. A Novel. By Miss Mulock, author of "John Halifax, Gentleman," etc.
40. Amos Barton. A Novel. By George Eliot, author of "Adam Bede," "The Mill on the Floss," etc.

News of the Week.

HOME NEWS.

SATURDAY, Jan. 9, 1886.

THERE were 60 convictions for unlawful cohabitation under the Edmunds law in Utah last year. . The President has finally determined to appoint a successor to Judge Advocate-General Swaim, suspended. Swaim's case will probably be left with the courts for future action.. .. .A blizzard raged in the Northwest from Saturday to Monday —being especially severe in Kansas, Nebraska, Iowa, Colorado, Minnesota and New Mexico. Snow fell in large quantities, and was badly drifted; and railroad business was much interrupted in consequence. In Pennsylvania during the same period there were disasterous floods—the loss to lumbermen in one section alone being estimated at $3,000,000 ... ... The total earnings of the Northern Pacific Railway for the year 1885 were nearly $11,500,000. This is a decrease of about $1,200,000 as compared with 1884.. .The resumption of work in the iron collieries at Pittsburgh brings out the statement that the strikers lost nearly $2,000,000 in wages, and the operators have suffered to a large amount by the prolonged suspension.. . . .A vein of petroleum has been discovered at Park Hill, Ontario, 175 feet below the surface Small-pox has almost entirely disappeared from Montreal, though it is still playing havoc in some of the neighboring villages. In L'Assumption, a village 70 miles from Montreal, 60 cases are reported, and an "alarming outbreak" is reported from Ballyduff, Ontario. There are a considerable number of cases in and about Quebec. also . There are still reports of a threatened outbreak among the Black-feet and Blood Indians of the Northwest, who are greatly enraged at the recent hanging of some of their race, who were guilty of special atrocities during Riel's last rebellion. The Crees and Stonies are also said to be highly discontented, although at present working quietly. The "whites" of Manitoba are much displeased at these belligerent reports, as they tend to check immigration, which is earnestly desired in that Province, and accordingly they declare that there is no likelihood of further trouble in the Northwest .... In this city last year there were 35,696 deaths, 30,030 births and 11,716 marriages, as against, in the preceding year, 35,054 deaths, 30,527 births and 11,805 marriages. Thus the death list increased 662, and the number of births fell off 497, due possibly to the sudden cessation of foreign immigration.. ..... Ex-Senator Jonas, of Louisana, who was lately appointed Collector of the Port at New Orleans, is considered an "offensive partisan" on account of having used his office to secure his own re-election to the U. S. Senate. The Civil Service Commission is to investigate the matter, and meanwhile Jonas will not be "confirmed" by the Senate ... The New York Daily Commercial Bulletin of Jan. 5, estimates the fire losses in the United States and Canada during December at $9,200,000 and the aggregate loss during 1885 at $94,200,000, or $16,000,000 less than the previous year.. ... Forty-seven million bushels of grain were shipped from New York to foreign countries last year, and not one bushel of them in an American bottom. In 1884 there were two small shipments under the flag of the United States. Last year not one. Of the 1,192 vessels which carried this immense quantity of freight across the ocean in 1885, more than half were British. In round numbers, 44,000,000 bushels went in steamships and 3,000,000 in ships under sail . With regard to the commotion against Land Commissioner Sparks, Special Agent Webster Eaton, after examining a portion of the Duluth and St. Cloud districts, reported that 4,300 homestead entries had been made, all requiring five years' residence by actual settlers, and yet there were not 100 actual settlers living by farming on the soil in the whole region. The latest addition to the Canadian colony of American bankers and trustees is Judge Yates, of Peoria, Ill., a gray-haired old citizen and lawyer, who was put in charge of the unsettled estates and the funds of the widows and orphans of the community. He has contrived to steal about $250,000, most of which he has spent as he went along. When the storm was about to burst the venerable rascal slipt off to Canada between two days .. Secretary Whitney expects to see at least $10,000,000 voted for the increase of the Navy .... Prof. Greener, of Washington, Secretary of the New York Grant Monument Fund, thinks that half a million dollars will be raised for a memorial. He cuts down half on the original project. President Cleveland has just given $100. The Fund now amounts to $113,870 .....John Sherman has been renominated for the United States Senatorship by the Republican caucus of Ohio, without a dissenting voice. This insures his re-election . Chicago is to have a crematory. That one lately erected on Staten Island, near this city, is kept pretty busy..

It is rumored in Washington that the President is likely to supersede Gen. Crook in command of the Department of Arizona. The people there have been very much discontented at his manner of conducting the war against the Indians. Sheridan still continues his friend, however .... The President has refused to give official countenance to the "American Exhibition" in London. All along this has been a strictly private speculation, got up for profit by a few adventurers in the name of the American people. Many prominent Englishmen believed in their misrepresentations, however, and lent their names to the scheme. We have persistently refused to speak of it, though we have received "any number" of circulars, etc., about it ..... President Cleveland has made changes in only 643 out of over 4,000 offices filled by Presidential appointment, and of the 49,500 postmasters, only 7,000 have been changed ..... Dr. Alexander B. Mott, of New York, and other Americans, have organized and secured incorporation papers for the "American Institute of Hydrophobia," for humanitarian purposes only. The Pasteur system is to be practiced, and reliance is placed on public benevolence for most of the means to support the institute.....

AGRICULTURAL NEWS.

SATURDAY, Jan. 9, 1886.

IN St. Paul, Minn., a company of Eastern capitalists is about to organize for the purpose of erecting elevators along the lines of railroads in North Dakota, which will be conducted on an entirely new plan. The company proposes to furnish to each farmer a separate bin in which to store wheat, and in this way, when he is ready to sell, he can always get the wheat which he delivered. It is also proposed to lend money at seven per cent. interest, to be secured by wheat in store... .. The legitimate outcome of the Chicago dressed beef industry comes in the moving of the packing-houses farther West into the heart of the cattle-raising region. If dressed beef can be shipped 1,000 miles in refrigerator cars, it can 2,000, and Hough & Dustin, of Lincoln, Ill., will build a monster packing-house on the Northern Pacific at Miles City, Mont. They will put up 10,000 tons of ice this Winter, and their establishment will be able to kill and pack 200 beeves a day .. . . Last Thursday Speaker Carlisle appointed the various committees of the House of Representatives for the current session of Congress. These have to investigate and report upon all legislation connected with the subjects embraced within the scope of their respective lines of supervision. Whenever a bill or resolution is introduced into the House, it is at once "referred" to the committee in charge of the subject to which it relates. The Chairman in charge of the Committee (his name always comes first) is by far the most important personage connected with it, as he can easily pigeon-hole any measure which may have been "referred" to his committee, if he is opposed to it, or push any measure he may favor. The Committee on Agriculture will have charge of all legislation relating directly to the agricultural interests of the country. It is composed as follows: Democrats—Hatch, Missouri; Aiken, South Carolina; Green, North Carolina; Winans, Michigan; Frederick, Iowa; Davidson, Alabama; Stahlnecker, New York; Morgan, Mississippi; Glass, Tennessee. Republicans — White, Minnesota; Funston, Kansas; Price, Wisconsin; Hires, New Jersery; Pierce, Rhode Island; Swinburne, New York; Gifford, Dakota. As the House is Democratic, of course, the majority of each Committee is Democratic, and so is the Chairman. Here is the Committee on Public Lands: Democrats—Cobb, Indiana; Henley, California; Van Eaton, Mississippi; Foran, Ohio; Laffoon, Kentucky; Stevens, Missouri; Landis, Illinois; McRae, Arkansas; Strait, Minnesota. Republicans—Anderson, Kansas; Payson, Illinois; Stephenson, Wisconsin; Jackson, Pennsylvania; Voorhees, Washington, Territory . ... The Tobacco Growers' Association at its convention at Buffalo last Wednesday, agreed to these three propositions: First—To ask Congress to levy a proper duty upon a whole bale of tobacco, not exempting any portion thereof. Second—To cause the duty on unstemmed tobacco to be fixed at $1.50, and stemmed $2. Third—That the standard of taxation shall be upon wrappers .. ..

The Indiana State Board of Agriculture has several branches of more or less importance to the farmers, which will hold their annual meetings at Indianapolis in the Agricultural Rooms. The Indiana Jersey Cattle breeders will hold their annual meeting January 19th. The Indiana Bee-keepers' Association will hold its meeting January 20th and 21st. The Indiana Short-horn breeders will hold their meeting January 26th and 27th. The swine breeders will hold theirs on the 28th, as will also the Indiana wool growers. Indiana farmers should make a note of the dates of these meetings, and make it a point to be present. The Fifth Ensilage Congress will assemble at the Grand Central Hotel, New York, on Wednesday, July 20th, at 10 o'clock A.M. The opening address will be by Mr. Geo. G. Smith, of St. Albans, Vt.—J. G. BROWN, Sec'y, 55 Beekman St., N. Y. .....

THE THORBURN POTATO.

This is, no doubt, the most valuable acquisition in the potato line ever offered. Messrs J. M. Thorburn & Co., of 15 John St., New York, now offer it for sale for the first time. They also send us a circular describing its merits, also giving the names of the distinguished growers from many sections who have passed judgment upon its value, by a trial of single tubers the past season. We advise our readers to send to the above-named firm for a circular. —*Adv.*

Crops & Markets.

SATURDAY, Jan. 9, 1886.

According to latest reports potatoes continued to rot to a greater extent than usual in most parts of the country as long as they could be examined. Were it not for the rot, the crop of 1885 would have been an exceptionally large one, and prices must have been low. Now it is likely that prices in Spring will be high in most places, but whether they will be high enough to compensate for shrinkage, rot and general deterioration, time will tell in each case. There is no general rule applicable to all cases. Returns will range from "very remunerative" to a "sad loss." The following was the average price per bushel on December 1, last according to private advices just received from the Department of Agriculture: Maine, 42 cents per bushel; New Hampshire, 44 cents; Vermont, 35 cents; Massachusetts, 67 cents; Rhode Island, 56 cents; Connecticut, 55 cents; New York, 45 cents; New Jersey, 54 cents; Pennsylvania, 47 cents; Delaware, 55 cents; Maryland, 49 cents; Virginia, 51 cents; North Carolina, 57 cents; South Carolina, 75 cents; Georgia, 94 cents; Florida, $1.27; Alabama, 97 cents; Mississippi, 76 cents; Louisiana, 84 cents; Texas, $1.00; Arkansas, 66 cents; Tennessee, 46 cents; West Virginia, 43 cents; Kentucky, 42 cents; Ohio, 39 cents; Michigan, 34 cents; Indiana, 36 cents; Illinois, 42 cents; Wisconsin, 47 cents; Minnesota, 40 cents; Iowa, 41 cents; Missouri, 39 cents; Kansas, 58 cents; Nebraska, 34 cents; California, 63 cents; Oregon, 36 cents; Nevada, 70 cents; Colorado, 61 cents; Dakota, 42 cents; Montana, 47 cents; New Mexico, 90 cents; Utah, 32 cents; Washington, 36 cents.

In 1884 the average price of the entire crop of potatoes was 40 cents per bushel. The lowest price was 25 cents in Michigan. The average in New York was 39 cents; in Ohio, 42 cents; in Indiana, 35 cents; in Illinois, 34 cents; in Iowa, 28; in Nebraska, 29 cents; in Kansas, 48 cents. The average price was two cents per bushel lower than in 1883, though the crop was not so large. In 1883 we had the largest crop ever grown in the United States. There was only a small advance in area over that of the previous year; but the yield went up from 78 to 91 bushels per acre, making a product of 208,164,425 bushels, or 38,000,000 bushels in excess of the previous crop. The average yield per acre for a series of years, according to the report of the Department of Agriculture, was 84 bushels. Owing to the abundant crop in 1883, the average price fell to 42 cents per bushel, from 57 cents in 1882. The last crop aggregated 190,263,068 bushels grown on 2,216,800 acres, and valued at $72,302,480. The crop, was, therefore, nearly 18,000,000 bushels less than that of 1883. Since the latter year, the consumption of potatoes has increased with the increase of our population. The loss from disease this year will be considerably more during the Winter than it was in 1883, and for both these reasons prices henceforth must be better than they were two years ago, when they averaged 42 cents per bushel.

AN immense business is done annually in New York City in handling potatoes, both for seed and home consumption. The great potato region of the State, north of Albany and west to Rochester, or beyond, finds an outlet for its product here. Add to this the thousands of bushels produced on Long Island and in New Jersey, and the product foots far up into the millions of bushels. The tubers are brought from the great potato fields of Northern New York in canal boats. These are securely lined with straw, with the hatches battened down. When shipped in this way after November, the tubers can be kept in the boats until wanted. Within a few years potato cars have come into use. These are lined so as to preserve an even temperature, and in some cases contain an arrangement for heating when necessary. In these cars potatoes are shipped in good condition from Northern Maine to New York. In fact, the recent improvements in shipping potatoes have about revolutionized the potato business. Large quantities are brought from Nova Scotia and adjoining Provinces. These arrive in good condition in small sailing vessels, and find good sale both as eating potatoes and seed. It is estimated that over 300,000 bushels have been received this year. The old Mercer, Beauty of Hebron and Prolific comprise the bulk of these imported potatoes.

Prices range from 25 to 30 cents higher at this market, as compared with prices last year. The quality is very inferior in every way. There are complaints from all consumers. Potatoes turn out soggy and heavy. This is due principally to the prevalence of rot during the past season, caused, generally, by the moist, hot weather. Some sections report a loss of at least 50 per cent. from this cause, while the potatoes saved seem, in many cases, somewhat affected. There is not so much trouble from scab, as heretofore. Many potatoes pricked or injured by careless digging injure the sale.

There is a good demand for Early Rose, from Maine, for seed, at $2.25 to $2.50 per barrel. The same sort from near at hand sell for less to be used for seed. Beauty of Hebron commands the same price, with less demand. Burbank is much the same. For domestic purposes, the Snowflake is decidedly the most popular, closely followed by Beauty of Hebron. For good keeping qualities, the Burbank is considered unsurpassed. Probably a dozen different sorts are sold under one or two names, in fact, to most potato buyers they are much the same.

Most large dealers prefer to buy about two or three weeks after the potatoes are dug —when the "sweating" process is done. They prefer to buy in bulk and do their own storing. Potatoes are sold to retail dealers in barrels. Most consumers buy them in small quantities, by the peck or half bushel. In this way they are compelled to pay tremendous prices. With some system of storage by which they could buy a barrel at a time, the price could be much reduced.

The potato business at this point is not equal in profit to the business of ten years ago. Too many have gone into it, and the improved transportation facilities have carried much of the business to other places.

The market for seed potatoes to be used at the South has heretofore been a valuable item, but much of this has now gone to Boston, Providence or Portland—nearer the fields where the seed potatoes are produced.

WHILE the Louisiana orange crop is larger than last year, the rust is worse, and this, it is believed, will probably about equalize the valuation of the two crops.

The California wheat crop is now estimated at 20,000,000 bushels, or from 5,000,000 to 8,000,000 bushels less than any former estimate.

Heavy snow storm in the Northwest last Sunday, became a rain storm as it traveled eastward. Little or no injury reported to the wheat crop. Roads all over the West very bad in the latter part of December; movement of corn and hogs therefore considerably checked. In Nebraska, farmers are getting from three to five cents a bushel more for corn on the car than they could get for it as shelled corn. It is to be held over for summer shipment. No snow and little frost yet south of the Ohio.

At Minneapolis, the flour production last week was 93,050 barrels, averaging 16,342 daily, against 77,200 barrels the preceding week and 107,460 barrels for the corresponding period of 1885. The list of mills running number 11, representing a daily capacity of about 15,500 barrels. The mills running are storing flour quite freely, and should the present state of affairs continue, it may become necessary to stop part of them. The exports of flour from Minneapolis for December were 98,000 barrels, against 138,800 barrels for November. The corrected figures for the year ending December 31, show the Minneapolis flour and grain trade for 1885 as follows: Receipts—Wheat, 33,500,000 bushels; flour, 21,468 barrels; mill stuff, 4,131 tons. Shipments—

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria,

Wheat, 4,944,240 bushels; flour, 4,949,931 barrels; mill stuff, 144,252 tons. Following are the figures for 1884: Receipts—Wheat, 29,322,720 bushels; flour, 102,152 barrels; mill stuff, 5,253 tons. Shipments—Wheat, 4,586,960 bushels; flour, 5,317,672 barrels; mill stuff, 140,959 tons. Wheat now in store—Minneapolis, 1,215,751 bushels; Duluth, 5,364,966; St. Paul, 6,200,000. Receipts last week—Wheat, 55,440 bushels; flour, 54,530 barrels. Business very dull now.

BUY the Boss Zinc and Leather Ankle Boots. (Others become worthless soon as wet.) The zinc lined bowl keeps the boot in shape and place in wet weather, and lasts a lifetime. Sold by Harness Makers on 60 days trial. M'f'd by DEXTER CURTIS, Madison, Wis.—*Adv.*

A Cough, Cold, or Sore Throat should not be neglected. BROWN'S BRONCHIAL TROCHES are a simple remedy, and give prompt relief. 25 cts. a box.—*Adv.*

MARKETS BY TELEGRAPH.

SATURDAY, January, 9, 1885.

CHICAGO.—Compared with prices a week ago, regular wheat is 2¼c. lower; No. 2 Spring, 3⅛c. lower. Corn, 3¼c. lower. Oats, ¼c. higher. Pork, 87½c. higher. Cattle, higher. Hogs, from 15c. to 20c. higher. Sheep, from 20c. to 25c. higher.

WHEAT.—Higher; sales ranged: January, 81¾@82¾c; February, at 82@82¾c.; May, at 87½@88¾c.; No. 2 Spring, at 81¼c.; No. 3 Spring, at 78@79c. CORN—Steady and quiet; Cash, 36¾c.; January, 36⅝@36⅝c; February, 36⅞@36⅝c. May, 39½@39⅝c. OATS—Steady; sales ranged: Cash, 28¾c; January, 28¾@28¾c; May, 31⅝@31⅝c. RYE—Steady; No. 2, 58c. BARLEY—No 2, 63@64c. PORK—Quiet; Cash, $10 25@10 30; January, $10 27½@10 30; February, $10 20@10 32½; May, at $10 55@10 65. LARD—Steady; Cash, $6 07½@6 10; December, $6 07½@$6 10; January, $6 07½@$6 10; February, $6 07½@$6 10. BULKMEATS—Shoulders, $3 70@3 75; Short rib sides, $5 10@5 12; Short Clear sides, $5 30@5 35. LIVE STOCK MARKET.

NEW YORK, SATURDAY, January 9, 1886.

TOTAL receipts for six days, 3,850, against 8,225 head last week. Shipments for the week 1,461 live cattle; 1,320 quarters of beef; 50 live sheep and 615 carcasses of mutton. Animals are generally heavy with a good many coarse and rough looking steers. Quite a range in price is noticed. Some very poor old cows sell as low as $1.50, while choice, high grade steers reach $6@$6.25. One bunch of 13 Kentucky steers, averaging 1,318 lb sold at $5.45. A small bunch of steers from Chicago averaging 1,317 lb. brought $5.90; these were extra choice grade Short horns of good shape and uniform color. Another bunch of 10 Pennsylvania steers averaging 1,420 lb, brought $6.15, while some Ohio steers 300 lb. heavier, but of poorer shape, brought the same price. State oxen, fine shape and color, weighing 1,875 lb sold easily at $6.35. One bunch of poor cows averaging 926 pounds, brought only $2.40. The majority of animals offered ranged from 1,000 to 1,500 lb, with prices from $1.90 to $5.15.

CALVES are few in number. General average at about 290 pounds. Fed calves bring 3¾@4½c.

SHEEP AND LAMBS.—Receipts for six days 33,895 head against 28,405 last week. One bunch of 213 State sheep averaging 82 pounds reached 5c; another of 223 Michigan sheep averaging 78 pounds sold for 4½c. Good Pennsylvania and State lambs, averaging 65 pounds sold for 6½c.

HOGS.—Receipts for six days 68,816 head against 23,216 head last week. Market steady at $4.30@4 40.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.
It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.
AS AN EVIDENCE OF FAITH
in my remedy I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.
1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.
2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.
Facts are Better than Assertions.
Please read the following testimony:
GIBSONTON P. O., PA., Feb. 2, 1885.
Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*
Yours very truly, WHITE & CO.
[N. B.—White & Co., since writing the above letter, have purchased $4.50 worth of the remedy.]
The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.
JOS. HAAS, V. S.
Member of Indiana State Veterinary Med. Association
INDIANAPOLIS, IND.

Buy the Best. THE EUREKA

Awarded FIRST Premium and Gold Medal at World's Fair New Orleans, over 12 leading Wind Mills. Agents that sell machines make from $50 to $100 a week. Illus. catalogue, terms, &c., free. STANDARD MFG. CO. Cincinnati, O.

For the Young.

THE BEAN PRIZES.

UNCLE MARK has waited patiently for the reports, and as he said last week, "time is up." A great many of the Cousins worked for the prizes and Uncle Mark is only sorry that they cannot all have some reward beyond the feeling that they have done their best. Many of the beans were killed by the frost, and the chickens captured many more. It was hardly a fair trial, in some respects, between Cousins in the far North and those in the South, for the latter had no hard frosts to contend with. It may be that next time we can get something that will make a more even trial. Now for the names of the winners—that, I suppose is the most important of all.

In Class No. 1, for the largest number from one bean, the first prize, a pair of club skates is won by Neal Eckerson, Marlboro, N. Y.

The second prize, a folding pocket microscope, is won by Judson W. Griblin, Virgil, Kansas.

In Class No. 2, for the largest number of beans from 15 beans.

Frank W. Elliot, Stone's Prairie, Ill., wins the first prize, a copy of "Little Men." The second prize, a microscope, goes to Coy Chamberlain, Marietta, Ga.

There was not a single pod reported containing seven beans.

In Class No. 4 for the largest number of pods containing six beans, the first prize, a beautiful autograph album, is won by C. Eugene Griblin, Virgil, Kans. The second prize, a microscope, is won by Lon Hall, Glen Cove, L. I.

In Class No. 6 for the largest number of pods on one vine, the first prize, a handsome knife, is won by Tullula Herron, Caldwell, Texas. The second prize goes to her sister, Mollie Herron.

Uncle Mark wishes to thank all the Cousins for the good work they have done in this contest, as well as their fathers and mothers who have superintended the counting. Those of us who have missed this time musn't feel badly about it, we shall have another chance someday, and then we may do better.

I think we had better call this our Bean *Special*. I have had some very good notes sent in with the reports, and I think we can learn something from them about bean culture.

The largest number of beans reported from one bean was 657; the largest number from 15 beans 13,801; the largest number of pods containing six beans 35; the largest number of pods on one vine 260. Jack Frost must have spoiled at least 100 chances, and the chickens, cut-worms, wood-chucks, rabbits, the wind, and even the cows seem to have had a spite against us. I don't think any of these prizes were lost through inattention or carelessness. I hope not, I am sure.

NEAL ECKERSON describes the culture his beans received, as follows: "After the ground was plowed and harrowed, furrows were opened five feet apart. Then barn-yard manure was put in the furrows the whole length of the rows and the manure covered with a plow, the ridges raked down and the poles set about four feet apart. Then a low hill was made around each pole and the beans planted one to each hill. They were kept well cultivated and had a top-dressing of ashes and plaster.

JUDSON W. GRIBLIN: They were the first Lima bean I ever saw, and all I knew about them was what I learned from the good RURAL. Kansas is not a bean-growing State, and I received them late (I do not remember the date, for I lost my book in which I kept an account of growth, etc., of my garden produce). As soon as I found out you were going to send them, I put a lot of ashes on the ground, which had previously been manured and plowed. I then spaded it and got it in fine condition, but by the time the beaus came it was hard, so I did it all over again and planted as you directed. But I shall put them farther apart next time, they made such a rank growth. Every bean came up. They wanted to run all over and I had to keep busy making each one stay on its own pole, and nipping the ends off. The vines were full of blossoms and small pods when the frost came. The chicks and kittens seemed to know those beans were extra choice, and they took delight in climbing and flying up in the vines. I wish some of the Southern cousins would send me some cotton seeds, as I feel anxious to see it grow. I will in return send something.

Greenwood Co., Kan.

FRANK W. ELLIOT: I received 20 beans and planted them May 9. I first set the poles seven feet above the ground and two feet down. Then I hoed up small flat hills. I did not use any manure, as the ground was very rich garden soil. The beans all came up and I hoed them well. When they reached the tops of the poles, I picked out 15 of the finest of them for the prize.

COY CHAMBERLAIN: I have gathered 5,875, and Carl has gathered 3,465. We only tried for the fifteen hills, as we forgot to keep them separate two or three times when we first began to pick; so we had to give up trying for any of the other prizes. I don't know why I got so many more than Carl, unless it was because I hoed mine more than he did his; then, I planted mine a few days before he did, and they were in a more sunny place, and one of his vines was not much account; he never got but a few beans off it. Pa says its all owing to the cultivation, and it will be a good lesson for us, and show us what good, careful cultivation will do. The first beans I picked off from my vines was July 22nd, and Carl the 24th; and the last we picked was November 9; we picked and counted them as carefully as we could, but I don't suppose we got them all. Every time we picked them we would put down the number and the day of the month. We would have had quite a pile of them now if we had not eaten so many—they were just delicious. Ma says, the best she ever tasted.

LOU HALL.—I planted the beans you sent me on May 23; one bean in a hill, three by four feet apart, on good garden soil. Manured with good barnyard manure plowed in, and after Papa had made the soil fine by harrowing and raking, he made the hills and put in the poles. I used two handfuls of active phosphate in a hill well mixed with the soil. I received and planted 24 beans; 19 came up, and one dried up, or was eaten off by Mr. Cut Worm; but I stopped their fun by putting paper bands around them.

TULLULA AND MOLLIE HERRON:—We prepared a moderately rich plot by broadcasting and plowing under two bushels each of ashes and cow manure, after which the ground was thoroughly pulverized and leveled. A further addition of eight bushels of freshly-rotted cotton seed was hoed in broadcast, when the beans began to run. On May 7 the beans were planted 1½ inches deep, eyes down. On the 13th of May they were up. June 1 they began to run, when we gave them support. June 17, first bloom; Aug. 6, first ripe pod. They were cultivated, first time with shovel-plow, afterwards with hoes once a week until they bloomed, when they shaded the ground. They were planted three feet by two. They were pinched back as directed, but we think it won't do here. It makes them too late in bearing. It flooded through the latter part of May. June was very dry. July had light showers through the month; but on September 10 came the rain which made the beans. October 28 we had light frost, doing very little harm. On Nov. 7 came the killing frost, which found the vines very full of nearly grown beans.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I don't know as you want the Cousins to report on potatoes or not. I will send in my report anyway. First I will tell you what kind of ground we used and how we prepare it. First we plow up a two-year-old strawberry patch immediately after all of the salable fruit is picked; plant to corn and get a good crop; after this is gathered we fall-plow. In the following Spring we plow again and harrow thoroughly. Then lay off with a single horse plow and come back in the same furrow to loosen the soil in the bottom but not throw it out. We generally grow from two to three hundred bushels to the acre. For varieties we have White Elephant; Blush; White Star; Early Ohio; Dakota Red; Magnum Bonum; Wall's Orange; Granger; Early Sunrise; Early Harvest; Early Illinois and American Giant. White Elephant, White Star and American Giant are all long white potatoes. Blush we like better than any other, yet the Early Ohio is the standard early potato with most farmers around here. Dakota Red is not a good potato; it is wet and soggy when cooked, with us. Magnum Bonum keeps better than any other I know of, and is a good eating potato. Wall's Orange is of very good quality but rots more than some others. Granger is somewhat like White Elephant. Early Illinois and Early Sunrise are good, but Early Harvest rots too badly with us.

Your nephew,

Madison Co., Ill. WM. JACKSON JR.

[Many thanks for the report. It is a good one. Of course I want *all* the Cousins to report at any time they can.—UNCLE MARK.

DEAR COUSINS: The little girl that stays here wants me to write you a letter, so I have been trying to think of something new to write about. To-day it occurred to me to send the following; it is no made up story, but true, every word. I will write it just as I saw it. I was one day walking through what was then termed the Norris Orchard in company with a little boy about four years old. Suddenly the little fellow stopped and picked up a young dead robin that lay in the path. A few steps on he picked up another; before getting to the end of the orchard he had collected six of them. What could it mean; such a slaughter of the little birds; I was never more puzzled in my life, I could scarcely sleep that night for thinking about it. The next day, however, the mystery was explained. I had occasion to pass the same way; as I entered the orchard I noticed the little bird parents were hopping and fluttering from tree to tree in the most frantic way, uttering such pitiful cries, as if their little hearts were completely broken. I looked on a few rods ahead and there with a long pole in his hand stood old Norris, as he was called. He was thrashing and twisting the pole about amongst the branches of a big apple tree, while a gun stood leaning against the tree. I stepped back a few paces unobserved and watched him. In the course of a few minutes a nest full of young robins fell at his feet. He dropped the pole and commenced to mash the little peeping things with the heel of his big shoe. I was thunder struck; I walked up to him and asked what he meant by such cruel and wicked actions as these, and got for answer that birds were no good, they ate his peas and he was bound to kill every young one that was hatched on his place. I found I couldn't reason with him, so I turned and hurried from the spot. Now, dear Cousin what have you got to say to my story? I think I hear the boys say, "What a cruel man, I do not want to be like him. I will never rob another nest or shoot another bird while I live;" and the little girl, I know her well enough, for I was once a little girl myself, she will ask her Mamma to please not put the bird's wings in that lovely new hat of hers, or if it is already there she will ask her to please change it and put something else in its place. Am I not right? MARY WALEY.

Gales Ferry.

[I am sure you are right, and I will venture to say that farmer Norris felt the loss of these little bird-workers that he killed. The birds help us more than we know, and it is not only wicked but foolish to kill them.—UNCLE MARK.

UNCLE MARK: I received the beans which you so kindly sent. What particular kind are they? Many pods were on the vines when frost came. Beans are easily digested, and strengthen the body more than any other vegetable. The nutriment greatly resembles that of meat, so that it supplies the place of animal food to a great extent. The potato cannot do this. "Both experience and chemical analysis tend to prove that legumes [beans, peas, etc.] are the most nourishing part of the vegetable kingdom," says a noted German agriculturist. Peas are like beans, but they are not so sure a crop. If my letter goes into the waste basket, I can console myself with the fact that that is the place where it belongs. Rabbits are very plenty here. A great many are killed, but there are plenty yet. A neighbor is trying a food steamer. He thinks it a good thing. Crops were poor last Summer in this vicinity. Cause, too much rain.

JOSEPH JONES.

Prescott, Kan.,

[Challenger Lima Beans. You must not be too sure about the destination of your letters. Beans make an excellent food. It would be well if they could be eaten more frequently than they are.—U. M.]

PERSONALS.

THE boy Emperor of China is to be married in February.

EX-PRESIDENT Arthur is said to have an income of $100,000.

OF the eight candidates on the Presidential tickets of 1860, only Hannibal Hamlin survives.

THE health of ex-Vice President Wheeler, who has not been well for some time, is now better than it has been for several years.

THE ex-King regent of Portugal left his German-American widow—a Boston-born woman, by the way—a fortune of $4,000,000.

THE late Professor Edwin D. Sanborn, who was a distinguished and well-loved instructor at Dartmouth College, married a sister of Daniel Webster. Miss Kate Sanborn is one of his daughters.

MARSHAL BAZAINE is said to be living in Madrid in actual want. His wife has left him, taking her fortune with her, and the ex-Empress Eugenie will not even answer his begging letters.

GEN. LORD WOLSELEY'S appearance is decidedly effeminate, and when he speaks he accompanies each remark with a nervous shake of the head. He is disposed to be sociable, but is not a favorite with the "rank and file."

EX-UNITED STATES TREASURER SPINNER, whose signature on national bank notes mystified thousands of persons years ago, is now in Pablo Beach, Fla., in the enjoyment of exceptional health. He has passed his eightieth year.

SEVEN editors are members of the present House of Representatives. They are Boutelle, of Maine; Barksdale, of Mississippi; Haynes, of New Hampshire; Pulitzer and Merriam, of New York, and Scranton and Swope, of Pennsylvania.

RUMORS of Pope Leo's illness are confirmed. He is now admitted to be suffering from a dangerous affection of the bladder, and his appetite is very bad, and he often leaves his dinner almost untouched. Lately, too, after inviting guests to his table, he has several times been compelled to send them away before dinner was served.

MR. WHITNEY, the well known New-Yorker, who is now in Mr. Cleveland's Cabinet, is making changes in the Frelinghuysen house at Washington, that will cost at least $40,000. Mrs. Whitney is already very popular in Washington, as she was last Winter in New York, on account of her generous hospitality.

ROSCOE CONKLING has declined an invitation extended by the Grand Army post and prominent Hartford citizens to give an address in that city on General Grant. He says he has promptly declined all invitations to deliver lectures or addresses since his retirement from public and political life.

GEN. JUBAL A. EARLY is described as a venerable-appearing man, his long, white beard reaching to his waist and his bent figure indicating the rapid advance of extreme old age. He still draws a fat yearly income for lending his name as an attraction to lure greenhorns to invest in that monstrous swindle, the Louisiana Lottery.

GEORGE W. PECK, the "Bad Boy" humorist, is about 45 years of age, of good hight, and weighs about 160 pounds. He has light hair, wears a moustache and goatee, which is trimmed close. He was a cavalry officer in the Union Army, and has cleared $100,000 out of his "Bad Boy."

CLAUS SPRECKELS, "The Sugar King of the New World," as he likes to call himself, is said to derive an income of $5,000,000 from his sugar plantations in the Sandwich Islands. In his domain he wields the most autocratic power of any monopolist in the world. His home at Honolulu is like the dream of Sybarite. His wants are served an army of negroes.

M. JULES GREVY, who has been re-elected President of the French Republic, is a very quiet man and one of simple habits. He rises each morning at eight o'clock, sips his coffee or chocolate in his bedroom, and then, at about nine, begins to read his letters and papers. At 10 o'clock he goes down to his study and receives ministers, ambassadors, and other visitors, who come and go usually until midday. Then he rests for an hour, and perhaps helps his little granddaughter feed the ducks in the garden. At four o'clock he is usually found playing chess or discussing art and politics with his guests. He drives out afterward with his daughter, Madame Wilson, and on returning to the Elysée reads official documents and signs decrees until seven.

JOEL HORNER & SON, Merchantville, N. J.

FAIR AND SQUARE DEALING.

Believing that if a man has dealt squarely with his fellowmen his patrons are his best advertisers, I invite all to make inquiry of the character of my seeds among over a million of Farmers, Gardeners and Planters who have used them during the past thirty years. Raising a large portion of the seed sold, (few seedsmen raise the seed they sell) I was the first seedsman in the United States to warrant (as per catalogue) their purity and freshness. My new Vegetable and Flower Seed Catalogue for 1886 will be sent FREE to all who write for it. Among an immense variety, my friends will find in it (and in none other) a new drumhead Cabbage, just about as early as Henderson's, but nearly twice as large! James J. H. Gregory, Marblehead, Mass.

Sibley's Tested Seeds

Catalogue free on application. Send for it.

This NEW article is appreciated and approved by all progressive Farmers and Stock Raisers. The calf sucks its food slowly, in a *perfectly natural* way, thriving as well as when fed on its own mother. Circulars free. SMALL & MATTHEWS, 21 South Market Street, BOSTON, MASS.

Use the best Zinc and Leather Interfering Boots and Collar Pads. They are the best.

(From the RURAL NEW-YORKER, Dec. 19, 1885.)

BARN-YARD MANURE vs. FERTILIZERS.

Our good friend, Dr. W. S. Combs, of Freehold, New Jersey, reports an experience in the use of barn-yard manure on potatoes, which we cannot quite explain. He writes: "On one part of the field I put all my yard manure—150 to 175 good two-horse loads. This part of the field has also had occasional applications of barn-yard manure during the last ten years. The manure was spread last Fall and plowed in this past Spring. After plowing, the whole field was treated alike, MAPES' POTATO MANURE being applied at the rate of 1,500 pounds per acre, in three applications. The total yield for the 20 acres was 6,545 bushels, or an average of 327 1-4 per acre. The average on the part having no yard manure was 385 bushels. The largest yield of a single acre was 409 bushels."

While this was a splendid yield over the whole field, the difference against the use of barn-yard manure was more than 60 bushels. What could have made the difference? Was it the season, the soil, or was there a surfeit of manure? The soil was a clay loam and this field, when we saw it in August, was the finest sight we ever witnessed.

REMARKABLE HISTORY OF THE ABOVE FIELD.

With the exception of a small part of the field above referred to, where occasional applications of barn-yard manure had been made, this field had been fertilized *exclusively* with THE MAPES' MANURES since 1880. The field was formerly the "poorest on the farm."

The last three crops were as follows:

1883. POTATOES, with 1,000 pounds of the Mapes Potato Manure, per acre, yield, 4,915 BUSHELS, "Mammoth Pearl," on 20 acres. One acre yielded 355 BUSHELS. One acre received an extra application of the fertilizer when the plants were five inches high. This increased the average yield 115 bushels on the average yield of 240 bushels per acre.

1883. FALL WHEAT. ("Martin Amber," "Rogers Red" and "Fultz") Sown *without any manure or fertilizer*, relying on the lasting effect of previous dressing of the Mapes Potato Manure. Yield 710 BUSHELS of wheat on the 20 acres, being an average of over 35 bushels per acre.

Dr. Combs adds:

THIS FIELD FORMERLY POOREST ON THE FARM.

This field, before the use of the Mapes Manures, was one of the poorest on the farm; a yield of 20 bushels of wheat per acre had rarely been reached, and never exceeded. The old system with stable manure had failed to bring it up beyond 20 bushels of wheat per acre under favorable conditions.

The condition of the field to-day may be easily seen by the yield of wheat. The field will be plowed this Fall and put again into potatoes with Mapes Manure next year.

YIELD FROM ONE ACRE OF THE ABOVE FIELD, 41 BUSHELS WHEAT (WITHOUT RAKINGS).

One acre of this piece, "Martin Amber" (beardless), yielded 41 bushels, *without the rakings*. As an experiment in thin seeding, less than one bushel was sown, and this by drill. The product of grain of this acre sold for $100 for seed. Heads were three to five inches long, averaging four inches.

1885. This field was again planted with Potatoes, with 1,500 pounds per acre of the Mapes Manure, as also described by the RURAL. Yield—average, 327 1-4 bushels per acre from 20 acres. 385 bushels per acre from the Mapes Potato Manure alone. Largest yield, 409 bushels from single acre.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1878. NEW YORK, JANUARY 23, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Vineyard.

THE EATON GRAPE.

THIS grape, shown at Fig. 25, was received from J. B. Moore & Sons, Concord, Mass. The cluster weighed one pound. The leaf was 13¼ inches in extreme diameter, and 10 inches in length; thick, leathery, and the under-side thickly covered with a heavy brownish-yellow down more so than Moore's Early. Bunch, very broad, compact, double-shouldered; berries very large, some as much as one inch in diameter, round, jet-black, covered with a heavy blue bloom; adheres firmly to the stem. Seeds from one to four, quite large. Skin thin, quite tough, so that it would carry well to market, but with no bad taste when eaten close. Pulp quite large, tender and separating freely from the seeds, dissolves easily in the mouth. The pulp is surrounded with a large amount of a very agreeable juice, which, though not as rich as that of the Concord, has much less of the native odor, and is, withal, very agreeable. While the berries of this grape are fully as large as those of Moore's Early, and the clusters as large as those of the Concord or Worden, the berries have little of that hard, unyielding pulp that characterizes most large grapes. We speak of this grape solely from an examination of a single cluster and a single leaf; but we have a single vine for growth and comparison upon our own grounds, and if it sustains its present promise, it must prove a very desirable acquisition to the hardy black grapes.

EXPERIENCE IN BAGGING GRAPES.

I HAVE had considerable experience in bagging grapes for the last five years. In contrasting the bagged fruit with that exposed to the air, it has been observed by all my family that the bagged fruit has much more delicate skin and superior flavor. It is invariably a little later. To those who have been unsuccessful in this method of protecting grapes, the following suggestions may be of service.

In localities where the rot is very prevalent, it is important to do the work very early, as soon as the berry is plainly formed. If the weather is dry and fine during this early stage of growth and the bunches are protected before warm, damp weather, success is almost certain. Before commencing bagging where the fruit has rotted badly, a thorough cleaning up is very useful. Where one has only a few vines for family use, it will repay not only to prune rather closely and burn all the wood which is removed, but also to wash the remaining canes with a rather strong alkaline wash. If to this is added the farther labor of scraping away the surface soil and covering with fresh loam, so many sources of infection will have been removed that it will be easy to secure good fruit for the coming season. My neighbors, who did not bag, and who shared my grapes the past season, will testify that my Concords were delicious from the first of August to the first of November, and our climate is very productive of grape rot.

M. T. EARLE.

Cobden, Ills.

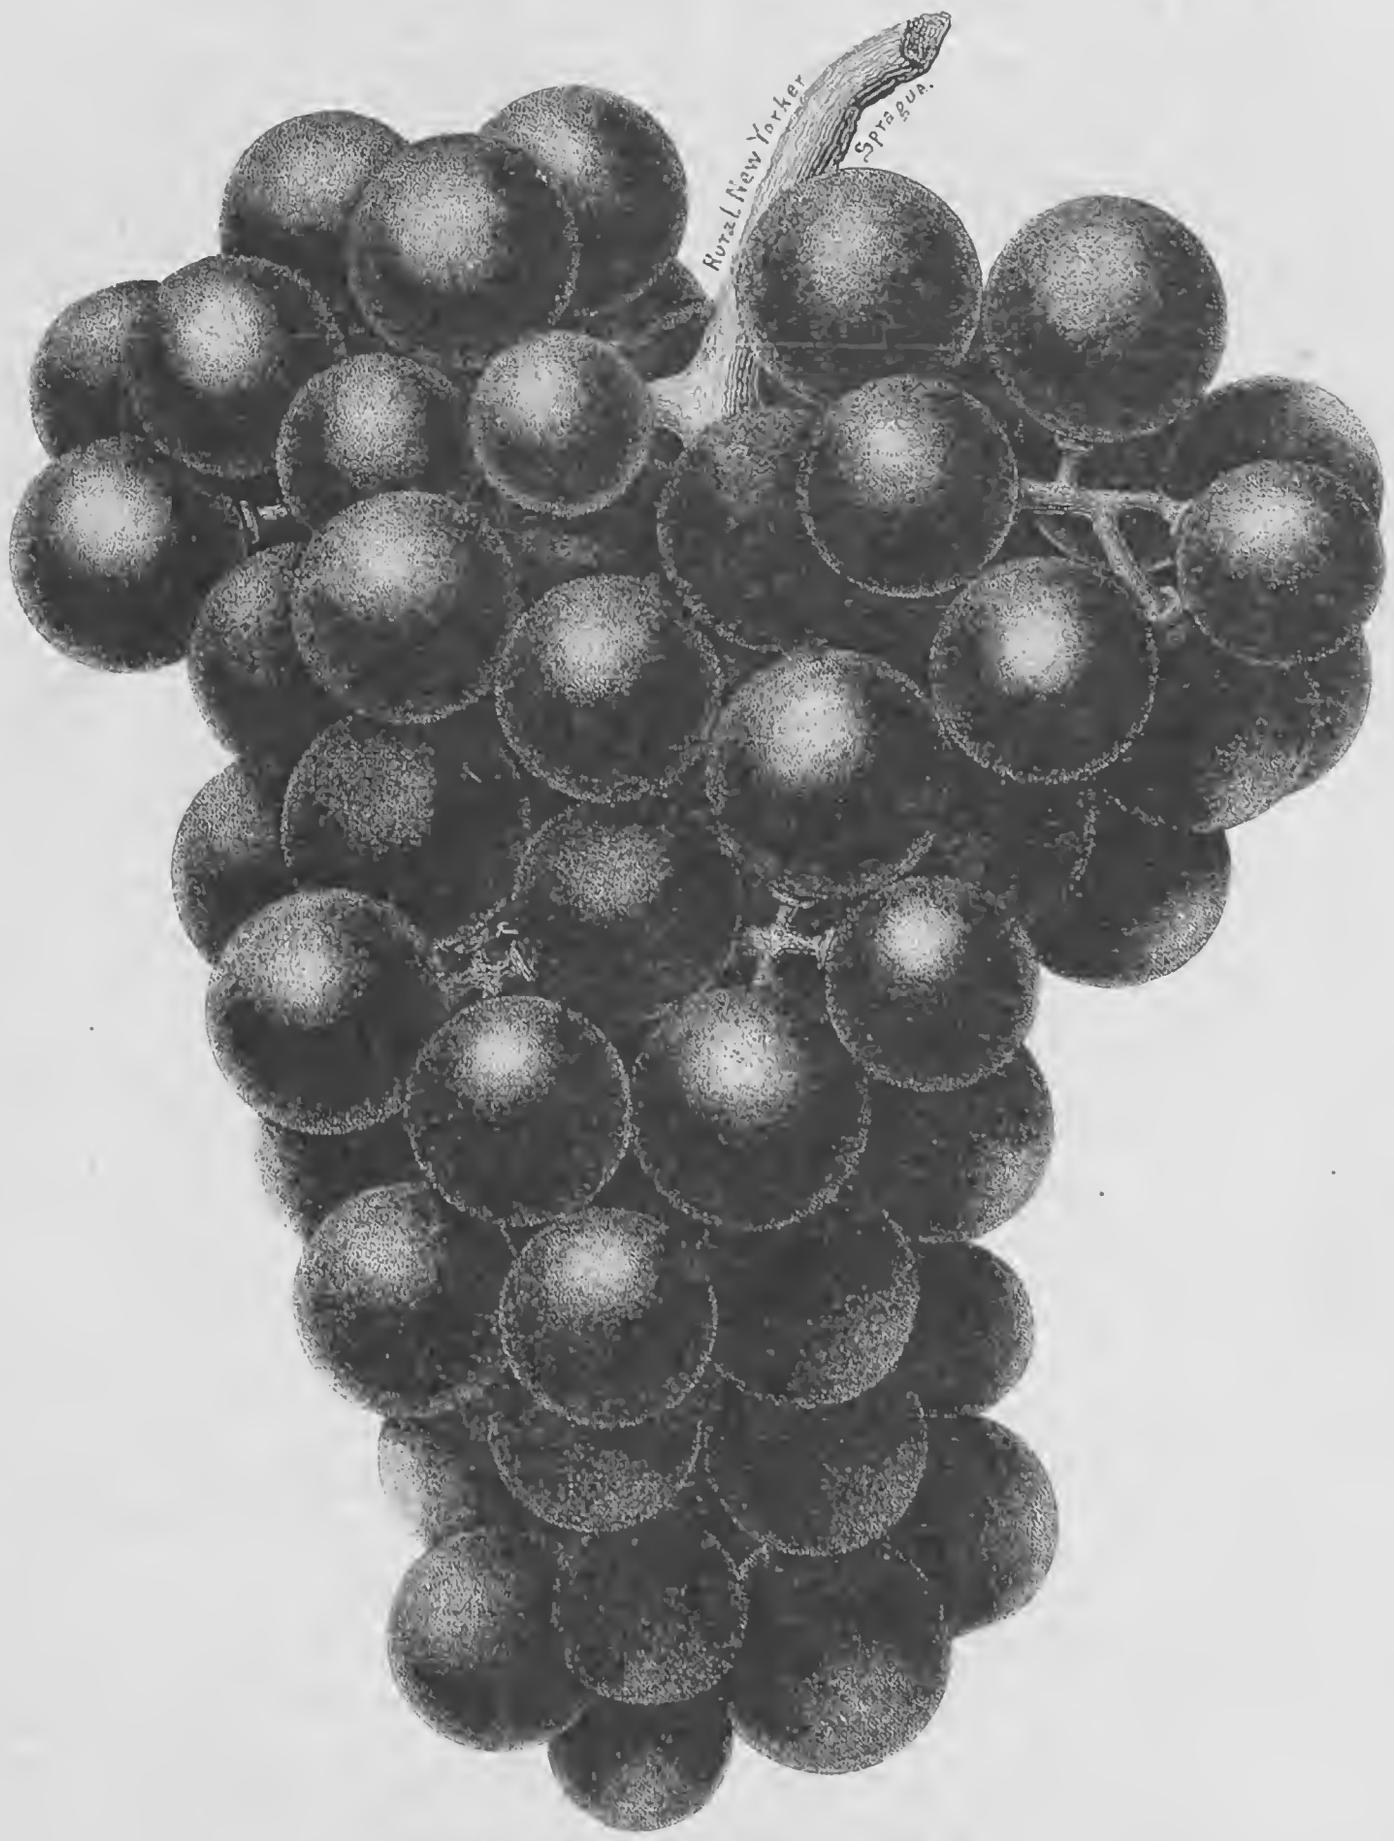
Sheep Husbandry.

Notes from the Rural's W. N. Y. Farm

FEEDING LAMBS.

WHAT FORAGE TO USE

for lamb feeding, is a question of prime importance to the feeder. While lambs are good eaters and not dainty, they are quite largely influenced by the forage which constitutes the bulk of their feed. Although they may be wintered, after a fashion, on corn fodder, meadow hay and other such foods, yet to do their best, there is a necessity for them to have something with a much larger proportion of albuminoids, or those elements from which the muscle or lean meat and the wool are so largely produced; and this is much more important when we attempt to feed a lot of lambs that have been shorn, and which we wish to force into the production of a second fleece of wool. We have tried millet, peas and oats sown together and cut early, and Hungarian Grass as well as corn fodder and other forages, but have never found anything to take the place of, or equal to clover hay. We have also examined the reports of many feeding experiments in England, Germany and in this country, and in all, it is clearly shown that clover hay is by all odds the best of all fodder crops as a sheep food, and doubly true is this as a lamb food. We have also found, by our own experience, that there is a difference of nearly or quite one-half in the value of clover cut early and late. While cut at once when only in full bloom, or a little before, will be eaten almost clean, that cut later or when half or more of the heads have matured, will be stripped of its leaves, heads and more tender branches, while the main stalks will be entirely rejected. Although the bulk of their fodder should consist of clover hay, yet when highly grained, and with foods rich in albuminoids, the lambs will readily eat a portion of coarser stuffs, such as corn-stalks or straw or meadow hay, though we have found their craving for a variety fully and easily satisfied with good, clean, barn-housed straw. Our advice, then, to the lamb feeder would be to provide an abundance of clover hay; by all means to cut it early, certainly as soon as in full "color;" to cure it in the cock, and for an addition to this, in the way of variety, to feed straw; and it will pay any one to have a barn large enough so that his straw can be housed.



EATON GRAPE. From Nature. Fig. 25.

JOTTINGS.

OUR good friend, J. A. Saxton, of Canton, Ohio, writes us calling attention to the desirability of giving barns greater hight. He says "With the present facilities for getting hay and grain or straw into the upper parts of barns, it is very poor economy to build them with 18 or 20-foot posts when you can add 50 per cent to their capacity, at an extra cost of not over 10 per cent., by making the posts 27 to 30 feet high. It is the lower part of the mow that is the most valuable for storing produce, and when the posts are lengthened it is equivalent to adding so much at the bottom of the barn all round. A barn 50x40, with 18-feet posts, has a capacity of 36,000 cubic feet, while the same barn, with 28-foot posts, would have a capacity of 56,000 feet, and could not cost one-tenth additional.

The new barn on the Western New York Farm has the same defect, and by your Jottings in the Jan. 2d RURAL, I should judge you have found it out. How much more would it have cost if you had built it with 28 or 30-foot posts instead of 20?

Some years ago I built a barn 50x80 feet, with 24-foot posts, and two years ago I had to build another 40x75, and I made the posts 28 feet, and neither is too high."

Our friend is quite right in calling attention to this matter. As a rule, barns are built much too low. It is a fact that a barn with 24-foot posts, while having only about 50 per cent. more room than one with posts 16 feet, will hold nearly twice as much grain or other produce. This is owing to the much closer packing of the lower part of the mow, by reason of the weight of the upper portion. But the hight should depend to a great extent upon the shape of the roof. Our new barn is 50 feet wide, and has a gambrel roof with the lower section of the rafters nearly perpendicular, so that the ridge of the barn is over 50 feet above the floor, and this is quite as high as we think it profitable to work a horse fork, and certainly as high as we care to put the straw when thrashing. But were we to build, with the ordinary double roof, we should certainly not make the posts less than 30 feet, and even higher would be preferable. Every one planning to build a barn next season should consider this matter now.

We are just through cleaning the sheep pens

the first time over. The manure has been drawn and spread on the ground to be used next Summer for corn and roots.

From numerous experiments we are fully satisfied that two loads of manure spread now on a clover sod to be used for corn next Summer, will produce as good results in the crop as will four loads applied just as the ground is to be plowed for planting.

There are many reasons in favor of drawing and spreading manure as fast as made; we have more time than in the Spring: a day now when men can be had at low wages, is made to save a day then of higher wages; a team can draw now, when the ground is frozen, two or three times as much as on the soft or muddy fields then. The manure being evenly spread while containing all its richness, fresh from the stables, much more evenly distributes this plant food, and it is a fact that a better result always follows the winter application.

Farm Topics.

STOCK-FEEDING IN THE WEST. No. 5.

PROF. J. W. SANBORN.

Improved farming in the West demanded; great value of corn fodder; need of rotation of crops; advantages of it; lessons of 10 years' experiments; straw and corn fodder in combination; examples; colossal wastes in the West; recapitulation.

ALTHOUGH I may have, in years before, written in fragments for the RURAL something of the following views, it is appropriate to complete a scheme of stock-feeding in the West with a method of handling the farm and the fodder. These remarks will be quite general.

In the consummation of a more profitable system of stock-feeding, the method of farming pursued here will have to undergo a radical change. I am often told by my friends that the system of conservation of straw and corn fodder, which I have advocated here in season and out of season, is adapted only to the small, pains-taking farmers of the East. What are small farmers? Let us see. The farms of Vermont, a well-settled State, average 137 acres each, while those of Missouri average 129 acres, and those of Kansas 157 acres. Our bigness in farming is bigness in single crops and not in area tilled. A distribution of crops on the farm by a six years' rotation will immensely change our views regarding our ability to save our wasting corn-fodder and straw. The nutrition of an acre of well-preserved fodder-corn is but little short of that of the corn grown upon that acre, and the neglect of this involves a waste of nearly as much as is saved under our system of farming. Under rotations, the 100-acre field of corn, whose fodder goes to waste from supposed or real want of time to handle it, may all be easily saved when 16⅔ acres of corn, 16⅔ acres of oats for hay or grain, 16⅔ acres of clover, 16⅔ acres of wheat, and 33 1-3 acres of Timothy are grown. The labor under such a system of farming is distributed throughout the year, and leaves no pressure at any point of the year's work. Under such a system, the corn-fodder can be easily put into little shocks of 24 to 30 hills in September, when going out of the dough state, and can be quickly husked, and by the 20th of October, all of the fodder may be stowed in its green-colored condition away in the barn, where an acre of it is better than the wintering of a steer, in lieu of the 10 acres needed per steer under the present primitive plan.

The question asked by my Kansas correspondent regarding the disposition of surplus corn will then have disappeared, for no surplus corn will be on hand, but rather the contrary. It will also settle the question of winter feeding to use up the corn which now, as before stated, is not so profitable as summer feeding or rather making beef on grass.

Again, we have to note other advantages: to wit: The greatly increased crops, through rotations, that inevitably follow such a system. It also affords opportunity to give better tillage and to perform all work much better, thus securing a higher standard of farming. Again, it gives as much labor in Winter in barn feeding of stock, etc., as is required in Summer by a judicious system of rotations. This uniform need of labor brings the cottage house for the laborer, removes his burdens from the farmer's wife, and converts a vagrant farm laborer into a householder on the farm and into a party interested in the farm.

By this system we shall not reduce the number of cattle that the farm will carry, but shall double the capacity of the farm for stock, and increase the profits per animal.

The barn, noted in No. 4, opens up the opportunity for food combinations, as well as for food conservation. Most readers of the RURAL know that for ten years I have been engaged in testing food rations, and particularly food combinations, to ascertain the economy of such combinations, and the ratio of carbohydrates to albuminoids needed. The outcome of this work has led me to place great value upon straw and corn fodder when rightly fed, and no value upon them when wrongly handled. Their observed inadequacy as foods arises from the small amount eaten, and does not closely cover their nutritive value. When put into a food combination wherein enough is eaten, a pound of stover or of corn fodder often, with me, becomes the equivalent of a pound of Timothy. In other words, many average trials with clover and oat straw fed together, have given as good result as Timothy hay.

Eleven tests of "roughness," and three pounds of various nitrogenous foods furnishing 1.18 pound of digestible albuminoids, 7.71 pounds of digestible carbohydrates, and .37 pound of digestible fats per day, gave .88 pound of growth per steer.

Five tests for five years with Timothy hay furnishing one pound of digestible albuminoids, 11.8 pounds of digestible carbohydrates and .30 pound of digestible fats daily, gave an average growth of .80 pound daily.

These figures, the answers of steers in careful tests, are well worthy of our stockmen's study, and I may well suggest again the question: "Is our colossal waste of fodders necessary and is it profitable?" In the West more fodder is wasted than is consumed, and upon food wasted more cattle could be kept than are now kept in the West.

Finally, the positions taken in these brief papers are as follows:

First, that the hog should disappear, and the spring shote should go to market in the Fall, being fed on mixed foods and cut grass, corn being a less prominent food and shipstuff a more prominent one. Second, that grass beef should supplant winter-fed beef; third, that shelter is profitable and indispensable to the best farming and feeding; fourth, that manuring is now demanded very generally; fifth, that rotation is of pronounced importance in profitable stock feeding; sixth, that food combinations in which our "roughness" should be fed, will cheapen the cost of our beef.

Columbia, Mo.

[REMARKS.—We cannot too strongly indorse the position taken by Prof. Sanborn in the foregoing papers, and which he so clearly puts in the paragraph above. The sooner the farmers and stock-growers of the West learn these truths and come to farm accordingly, the more money they will make.—EDS.]

TURNIPS AS A "CATCH" CROP.

I LIKE what was said by the RURAL in regard to using turnips as a "catch" crop, or for supplementing the corn, bean and potato crops. I sow them at the last cultivation of these crops, and have usually a fine yield. I pull the largest and best, feed off the balance; in Spring plow in what may be left and the droppings of the animals while eating off the crop grown. I have practiced this for years, and find much profit in it. A. S. B.

Grand Rapids, Mich.

Dairy Husbandry.

DAIRY NOTES.

T. D. CURTIS.

BAD VENTILATION OF STABLES.

IT is a singular fact that in nine-tenths of the cases, the fresh air is let into the stable at the rear of the cows, instead of in front of them. The result is that the cold air drops down behind the cows, in its way to their heads, and sweeps along with it the odors from the smoking droppings, added to the constant exhalations from the cows' bodies, for them to inhale at every breath. Some have even argued that this is the correct way of introducing pure air because animals turn their tails to a beating storm! They forget that the animal seeks to protect its eyes, and to avoid a strong current which interferes with breathing, while its head is still in the midst of plenty of fresh air. The cases of a cow in a storm and a cow in a stable are not the same. Any animal closely confined will instinctively turn its face to the light and its nose to the fresh air. Usually there is some upward draft in front of the cows, but often there is none, while few make a free use of absorbents or deodorizers. On entering, the air is loaded with offensive effluvia and almost suffocating. And then the dairyman wonders why his milk tastes and smells of the stable!

No amount of careful milking and handling of the milk will prevent this mishap under such circumstances. The odors and flavors which have been inhaled by the cows have mingled with their blood and poisoned their bodies, and the milk secreted from the blood is loaded with these odors and flavors before it is drawn. See that ventilation is perfect.

HEADS TO THE CENTER OR TO THE WALL?

Which is the more convenient, to turn your cows' heads to the wall and feed at the sides, letting the droppings gather in a passage-way between them in the rear, to be taken out on a sled or cart driven through, or to have the cows face together, so that all are fed from a single passage-way, while the droppings are scattered along the two sides, occupying twice the space needed? Or do you want to shovel them out through the window-holes in piles against both sides of the stable, to stand until they are drawn out in the Spring, when you are in a hurry with your work, or be left all Summer rotting and leaching, while your crops suffer for lack of them? Would it not be better to put the cows' heads to the walls, giving them the benefit of fresh air, with proper ventilation from their rear up through the roof of the barn? Wouldn't it make the cows healthier and the product sweeter? Then would it not be better to have the droppings all together behind and between the two rows of cows, and haul them out at least once a day, either spreading them "where they will do the most good," or piling them on your manure heap, under the manure shed to rot?

CLEANLINESS VS. FILTHINESS.

Gov. Seymour once said, before the American Dairymen's Association, that "cleanliness is a comparative term," and he requested the speakers to be exact in stating what was necessary to be done to secure cleanliness. This was a good idea. But I have observed that while everybody has some idea of cleanliness, there are some who appear to have no idea of filthiness! To them everything is clean. These are the ones that make a good share of the store butter, so much of which has gone into the market as grease. They keep their cows in the reeking atmosphere of a dirty stable, milk in a slovenly way, and never half clean anything that is used about the dairy. But how can they be reached and instructed? They think they are cleanly, and it will not do to tell them they are filthy. The cream-gathering or almost any system that will prescribe exact rules for managing the cows and handling the milk is a blessing to such dairymen and the community. This class of dairymen do not attend dairy conventions or read agricultural papers, yet they are a numerous class and need enlightening.

WHY DON'T THE CREAM CHURN?

I have just received a communication from a correspondent in East Saginaw, Michigan, asking why it takes three to six hours to churn his cream. I confess I don't know. The puzzle to me is why the butter comes at all, if it takes so long. Sometimes no butter can be churned from cream. Dr. Sturtevant mentions an instance where the cows had gone farrow a long time. Two cases of cream that could not be made to yield up its butter to the persuasions of the churn were mentioned at the convention of the Iowa State Dairymen's Association in 1884. Nobody was able to explain the reason why. It was a condition that came on suddenly, without any apparent cause. My correspondent's trouble came suddenly on the 28th of November last, just after the churning had been done in 15 to 20 minutes. The temperature of the cream was 60 to 64 degrees. He wants to know if it is in the food, which is "some oats, carrots, barley-meal, corn-stalks, and millet for hay." At the time of writing, 18 churnings had acted in this way. The cream is probably viscous and ropy, though he says nothing of its appearance. But if the butter refuses to separate in two or three hours, why should it separate at the end of five or six, if there is no change of condition but what the churn produces? Perhaps some of the readers of the RURAL NEW-YORKER can explain the matter. I confess, with Dr. Sturtevant, that I am every day puzzled with unexpected results, and "feel I do not know so much about dairying as I used to think I did."

A GOOD DAIRY.

John Allen, of Lyndonville, Vermont, says, through the Manchester Mirror, that his dairy herd has for years averaged "300 pounds of butter per cow or a little better." There are other such herds in the country, and there is still profit in such dairies, notwithstanding low prices. The marvel is that so many dairymen are content with 150 pounds of butter per cow, when it is possible to double the yield without materially increasing the expense. Many cows are kept at a loss. Is not here a hint as to one of the best ways of cheapening production?

EFFECT OF BUTTER STANDING IN BRINE.

Mrs. Mina Holmes says, in her essay which commanded the prize at the last Minnesota State Dairymen's Convention as the best treatise on butter making, that when granulated butter is washed with brine it must not be allowed to stand long in the brine as it will make the butter greasy and shiny. This is an important fact to know, since washing in brine is a recent practice and not as well understood as it may be. As over-working gives butter a similar appearance, perhaps the effect of soaking in brine is sometimes wrongly attributed to this. It is generally supposed that no unfavorable results could follow letting butter stand in brine any length of time. Butter makers will please pay careful attention to this point, and give the result of their observations to the public.

TOO BIG AN ESTIMATE.

Some one figures the creamery and cheese factory as saving nine-tenths of the labor. This is too steep. The gathering of cream and carrying of milk are evidently overlooked. These are quite a tax on the producer of milk, especially in the case of the cheese factory, and the greater the distance the greater the tax. When all is figured in, the dairyman does not make a saving of 90 per cent. in the manufacture of his milk into cheese.

ADVANTAGE OF BUTTER DAIRYING.

There is a marked advantage in butter dairying in the fact that it enables the farmer to consume on the farm what is produced on it, thus returning to the soil what is taken from it, while sending off a product that is drawn almost entirely from the atmosphere—butter being highly carbonaceous. Beef and cheese draw largely on the phosphates and nitrates—two substances quite difficult to supply, while fruits and grains draw still more heavily on the minerals and nitrogenous elements. True, the latter, like the carbon, comes from the atmosphere, but it is vastly more difficult to capture and utilize. Hence there is a profit in butter dairying that is not secured by any other line of farming to the same extent—the constant enrichment of the soil and increased productiveness.

HOLD YOUR GRIP.

Don't be in a hurry to throw up dairying because of low prices. It pays now as well as any other branch of farming. But weed out your stock. Make a careful test of every cow, and keep none that does not pay a profit. Get a male with a good pedigree, if you do not have one already, and breed from these selected cows. This will put you in the best possible condition to meet present and future contingencies.

DEVICE FOR SALTING BUTTER.

OUR friend, D. L. Roberts, of Royalton, N. Y., sends us a sketch of the device shown at Fig. 29, which he finds a great help in accurate

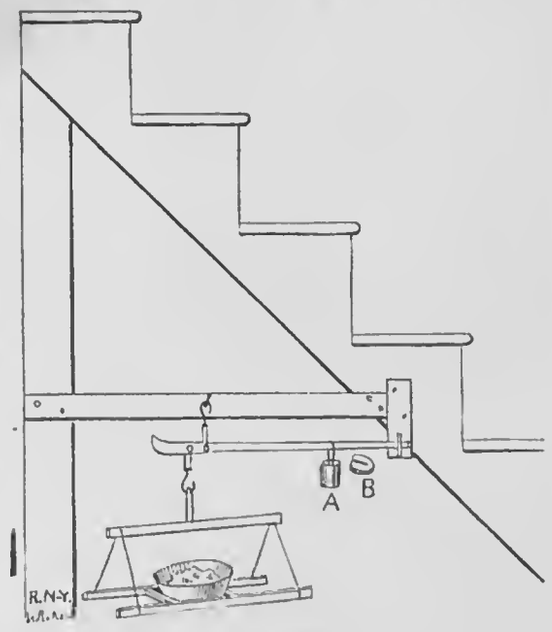


Fig. 29.

salting. An ordinary steelyard is hung under the stairs, in the manner shown. A staple fits over the outer end of it so that it can play up and down one inch. The rack upon which the butter bowl rests is made of two cleats, 20 inches long, with two cross-pieces ten inches long, forming a square of about ten inches. This rack is fastened by means of wires to another cleat of the same length, as shown in the illustration. This cleat is, in turn, fastened to the hook in the steelyard. In arranging for an even salting of butter, Mr. Roberts states that he first placed the empty butter bowl in the rack and balanced it with a small bag of nails hung at A. As he wished to use 1¼ ounce of salt to the pound of butter, he set the poise at eight pounds ten ounces, and balanced the bowl by pouring grain into it. Then he placed the poise back to eight pounds, and placed on it a small piece of lead, B, just large enough to balance the steelyard. This was fixed with a knife so that it would slip over the poise. In salting, the butter is first weighed and then the piece of lead is placed on the poise and salt sprinkled on the butter until the beam of the steelyard comes up. In this way the proportion of salt is the same, every time. The arrangement has been in use over two years and has never varied.

The Swineherd.

PIG DIET.

COL. F. D. CURTIS.

Evils of a clear corn diet; need of mixed feed; examples; need of warm sleeping quarters; preparing corn for feed; corn-and-cob meal.

I HAVE spoken of the injurious effects of a clear corn diet when pigs were shut in pens for fattening, and that it caused a feverish and irritated, if not an inflammatory condition of the stomach and bowels. There is no doubt of this, and the fact that hogs have been fed and fattened in this manner for a long time, or will be, does not affect the truth of the statement. The condition of pigs and their fitness for food can be improved by simply giving them less corn and some green grass, clover or corn-stalks. This kind of feeding makes the food more complete and more healthful. The pigs will show their wisdom by eating this kind of food with a decided relish. In cold weather vegetables or fruits can take the place of the other succulent foods. A chance to help themselves to grass or fruit will save the labor of securing it for them, and this system should always be followed where it is possible.

A lot of 10 old sows were managed in this way. They were put into a field where there was a rank growth of grass following a mowing, and they fed on this grass and filled their stomachs. It would have cost about twice as much to have filled up these hungry sows and fattened them without the grass. Anyway, in a few days they ate 30 bushels of apples costing $3, together with a considerable amount of meal, and they were not satisfied either. This was before they could be turned into the grass. A lot of spring pigs, which had been kept in a pasture and had eaten it down so close that there was but little to be obtained, when turned into a fresh and luxuriant pasture, required but very little food other than the grass.

It helps, with all of this succulent food, to provide a warm and dry place for the pigs to sleep in. Those fed in this way will not stand the exposure that pigs will when fed on corn, because the corn produces fat and this is an element of heat—fat is heat in a practical sense.

It is both sensible and profitable to get the corn ground in the ear when it is dry enough, and to mix the meal with water 12 hours before feeding, or 24 in hot weather. It is then in a more digestible form and more of it will be turned into flesh than if fed whole or dry. When there are a great many hogs and no conveniences for mixing, of course it cannot be done, but this does not upset the argument.

The cob helps to fill the place of some other coarser food, and it aids in the digestion. Experiments carefully conducted by Prof. Shelton, Kansas Agricultural Farm, have demonstrated that hogs gain faster with the cob in the meal. It may be set down as a standard rule that there is five per cent. of nutriment in the cobs and ten per cent of digestible benefit, so that where they can be ground with the corn, cobs will always pay.

The Herdsman.

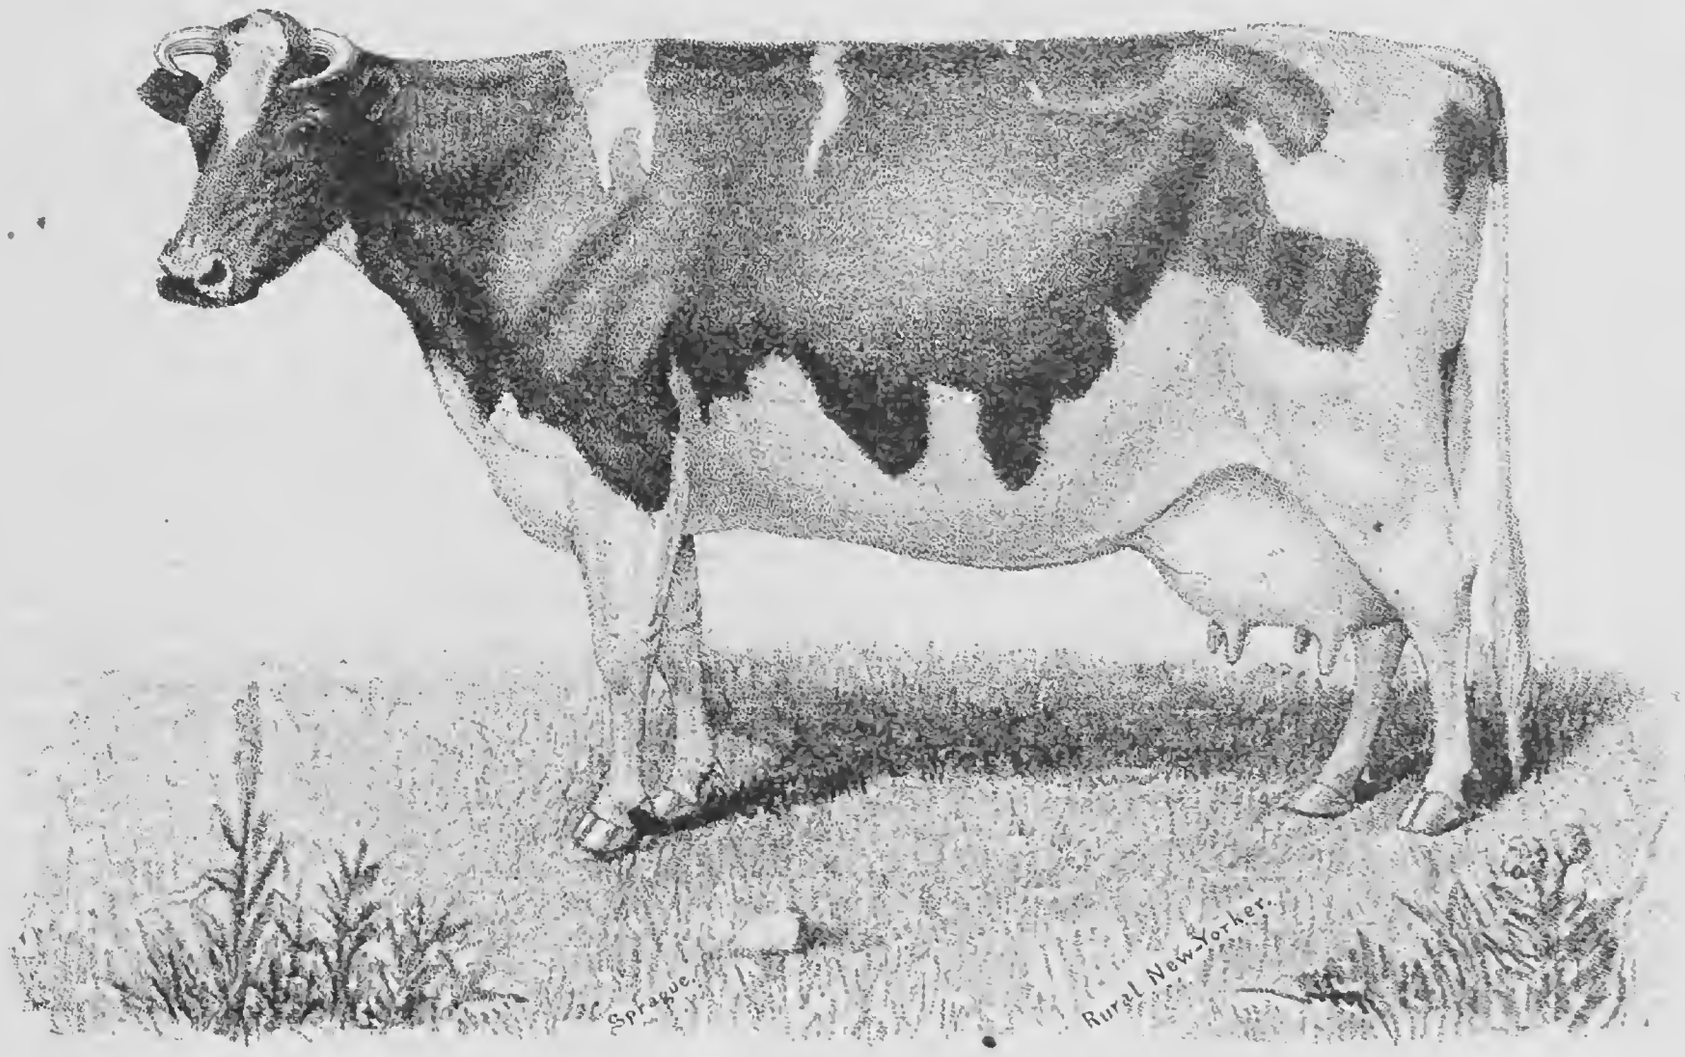
A PROFITABLE CALF.

I WAS very much interested in the article headed "Baby Beef," in a late RURAL, giving the weight and price per pound at which the pure-bred, roan, Short-horn steer Cleveland, sold at the late show in Chicago. I have had a nine-months-old calf killed, a grade Short-horn crossed with the Ayrshire, which, with no extra care, weighed a little over 300 pounds. I could not sell it at any of the markets in two neighboring towns, but pieced it out among my neighbors, with the exception of one quarter kept at home. All pronounced it very firm, sweet, juicy and tender, without any veal flavor. Neither was it tough like beef. Skim-milk calves can be bought for $7 to $10 per head. Those classed as yearlings being one year to one-and-a-half year sell at from $8 to $12. My calf was fed the extra milk from one cow after supplying a family of five throughout the whole time, from March until Thanksgiving, with the addition of a little bran and corn meal during the last two months. I think more profit was realized by feeding the sour milk to the calf than by using it in any other way. Full value of calf at the price at which it was sold, $25. H. L. C.

Charlton, Mass.

BEXJE.

WE show at Fig. 36 an excellent portrait of a Holland cow. This animal, Bexje (No. 1328 N. H. B.) No. 6340 H. H. B., is a fine specimen of her breed. She has all the marks of a milk-producing animal—large udder, small head and neck and a most decided "wedge shape." She has a milk record of 93½ pounds in one day. She was imported by her present owners, Messrs. B. B. Lord & Son, Sinclairville, N. Y. While there has been no "boom" in Holland cattle, they have been gaining ground steadily in public favor.



HOLLAND COW, BEXJE. Fig. 36.

The Poultry Yard.

RAISING INCUBATOR CHICKS.

P. H. JACOBS.

Chicks in the brooder; importance of heat; a successful brooder house; discription thereof; feed of young chicks; marketing; cost of chicks per pound.

As soon as the chick is hatched, it should become thoroughly dry before it is removed to the brooder. From the time of hatching to the age of ten weeks, the chicks must at no time be chilled, for while this may not be fatal, it induces cold on the bowels, and prevents rapid growth. It will do no harm for the chicks to run out in the open air, provided they return to a warm brooder. One of the greatest difficulties to contend with is that of impressing upon the operator the importance of keeping the heat in the brooder at a temperature of 90 degrees at all times. An incubator should never become too warm, or a brooder too cold. Should the chicks become slightly chilled and seek the brooder, they will trample on each other in the endeavor to become warm, and the heaviest loss occurs from such cause. A rule for guidance is to observe the chicks in the brooder. If they spread out and separate, keeping near the edges, the heat is sufficient, but if they crowd, more heat should be provided.

The most successful brooder house used in this section (Hammonton, N. J.,) is that of the Misses Anna and Emma Pressey, who hatched several thousand chicks last season. Figure 34 shows the brooder house, the brooder being placed in the left back corner, so that the lamp can be drawn out from the outside. The floor of the house is one foot off the ground, with an opening three feet square in which is placed the brooder. It has a slanting platform in front for the chicks to run up or down to and from the brooder to the ground. A wire cloth screen, or slat frame, is used at night over the front of the brooder house for protection. This little shed and brooder are placed in the center of a yard twenty feet square, facing the south, and are all that is required for the accommodation of 100 small chicks, or 50 larger ones.

The illustration shows only the shed used in this climate, and it may be made warmer for colder latitudes by extending the sides to ten feet, and of the same shape as the finished half, allowing the roof to extend over the open part, which is seemingly half finished, as at Fig. 34.

The brooder (see Fig. 35) is a box one foot

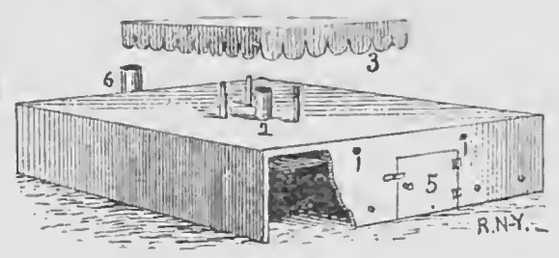


Fig. 35.

deep and one yard square, made of wood. One inch below the wooden floor is a sheet-iron floor one yard square, which, of course, leaves a space of one inch between the wooden floor on top and the iron one below. Two holes enter at the front (1, 1), between the two floors. Into these holes the cold air passes, coming out at

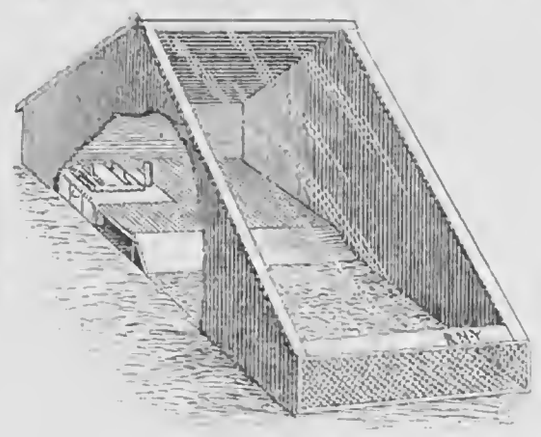

Fig. 34.

the tube (2) on top, which is 2½ inches high. The tube extends through the top floor only. The lamp, or small oil stove, is placed under the iron (or second) floor, the smoke escaping at the chimney (6), which is at the rear. The air from the tube (2) strikes the under side of the covering (3), which is raised to show the tubes, and diffuses itself over the chicks. This brooder has no sides or corners, and the chicks, if crowded, are pushed out, and can re-enter on another side. The advantage is that the heat is pure warmed air, constantly pouring in, thus serving as ventilation. When in the brooder house, the brooder is let into a square opening, bringing its top floor on a level with the floor of the brooder house. The covering is three inches from the floor of the brooder.

The first food of the chicks is hard-boiled eggs, chopped fine. The second day, bread soaked in milk is given, with the chopped eggs, and this continues for three or four days. After that time, cooked ground oats and meal, made as bread, and crumbled, are excellent. Chopped onions, lettuce, cabbage, and meat are given three times a week. As soon as they can pick up small grains, they are given a variety of any kind of food they will eat, being provided also with fresh water, sand, fine gravel, ground bone, pounded shells, etc.

They are marketed in January, when they usually weigh three-quarters of a pound each. April, however, is the best for prices, the demand then being for sizes not exceeding one-and-one-quarter pound. The Misses Pressey have 14 brooding-houses, and expect to raise 6,000 chicks this season, finding it very profitable. They have also a fattening-house, in which the chicks are kept for a week or ten days before they are marketed. They are killed and marketed in the dressed condition and sold by commission merchants in New York and Philadelphia. Young chicks cannot conveniently be marketed alive in Winter, as exposure would prove fatal, unless the season is very mild. The breeds used are mostly common hens, with Langshan and Plymouth Rock cocks. No eggs are hatched under hens, incubators being used altogether, and though a large number of hens are kept, the ladies also buy eggs from their neighbors.

The cost of each chick, per pound, for feed is five cents; but including *all* expenses, such as eggs for hatching, oil, rent of buildings, interest, labor, etc., the cost is a fraction less than ten cents per pound. The prices obtained were 65 cents per pound for the early chicks, which decreased to 15 cents as the minimum, the average being 35 cents per pound.

There are several poultry farms in Hammonton, and nearly all who raise chicks are familiar with incubators, and visitors come from all sections, no secret of the business being withheld. While other locations may not be as favorable as this, yet the fact that chicks may be raised with profit in large numbers without the aid of hens has been here practically demonstrated.

A NOVEL HEN COOP AND NEST.

THE hen coop and nest shown at Figs. 32–33 can be easily made, and might be of use in cases where a good many hens are in the habit of laying in the same nest. It is so arranged that only one hen can enter it at a time. It is made of a rectangular box, such as a soap box, open at one end. A hole is bored in each side near the top of this opening, and a broom stick is set in so as to revolve easily. Pieces of wire, such as clothes line wire, are twisted

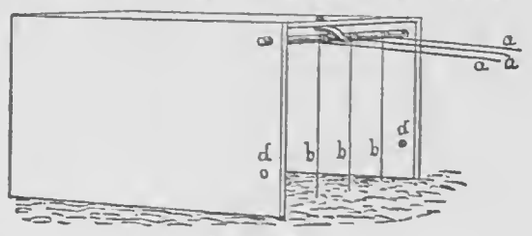

Fig. 32.

round the stick with the ends projecting at right angles to each other. Being light, the wires do not prevent a fowl from attempting to enter the box, and in doing so she pushes the wires, *b* (as shown in Fig. 32), inward and upward. A low partition, *c*, (Fig. 33) is placed across the middle of the box, in passing over which the hen is sure to lift the wires to the required hight; a nail driven in the side of the box will serve to limit the upward movement. While

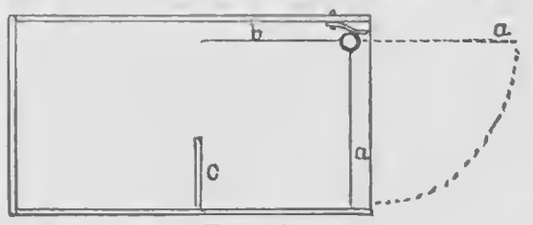

Fig. 33.

in this position a fowl attempting to enter is prevented by the wires, *a*. The hen within, in passing out pushes the wires out so that they resume the original position shown in Fig. 32. A spring of any simple construction is placed at the top of the box and bears upon the stick with friction enough to make it retain any position it is placed in. If it is desired to use it as a coop, a piece of wire is passed through the

holes *d* at bottom of the box, passing in front of the first wire, behind the second, in front of the third, and out at the other side of the box.

Farm Economy.

A REVOLVING STALK RAKE.

In the Winter the farmer may profitably spend some of his spare time in repairing his tools, or in making necessary implements. Among the earliest farm operations is the raking and burning of last year's corn-stalks; in preparing the ground for another crop. A good heavy rake is needed. Although many persons use a common hay-rake or a harrow, neither is as good as a special rake.

Figs. 26 and 27 show a "revolving" stalk-rake which does good work, and may be handled by any boy old enough to drive a team. Take a piece of wood (Fig. 26., A) five inches square and 12 feet long. Bore 16 two-inch holes

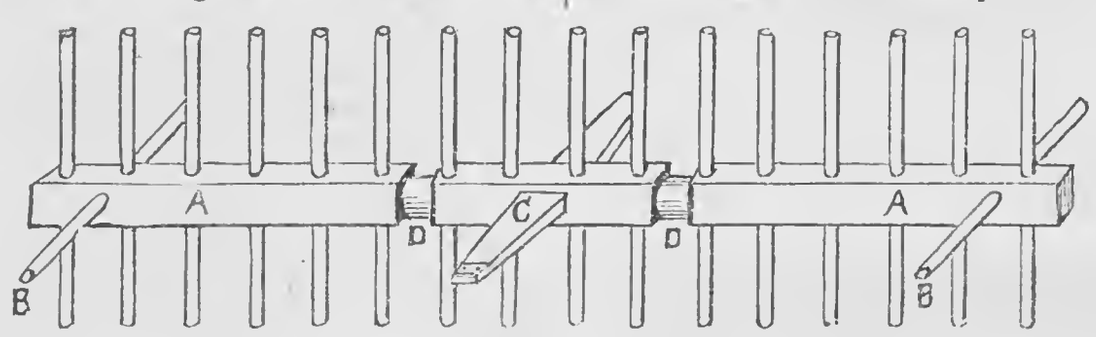

Fig. 26.

through it, making the center of the first hole four-and-a-half inches from the end. The other holes must be nine inches from center to center. This will make the center of the last hole just four-and-one-half inches from the other end. These holes are for the teeth, which should be made of good, tough wood, such as oak or hickory, perfectly dry. They should be two inches in diameter and 45 inches long. This leaves 20 inches as the length of the teeth on each side of A. Nine inches from each end of A, a round piece, two inches in diameter

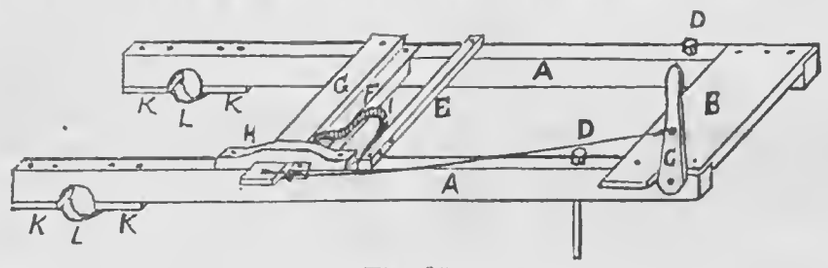

Fig. 27.

and 49 inches long, is put through it at right angles to the teeth. These pieces, B, B, extend 22 inches on each side of A. C is a piece 49 inches long, and five inches wide at the center, for a space of five inches, which is to go through A. It then tapers off to three inches wide at each end. It is two inches thick and must be made of good, tough wood, as it is to rest on the frame, Fig 27, and keep the rake from turning. The teeth and the pieces B, B, and C, should be firmly fastened in the piece A. C is exactly in the center of A. In the center of the space between the sixth and seventh teeth counting from each end, the piece A should be cut round, four-and-one-half inches in diameter, and for a length of four inches.

Fig. 27 shows the frame which connects the rake to the wagon, and on which is placed the apparatus for "emptying" it. The pieces A, A, are four inches square and 90 inches long. Near one end of each piece a kind of "boxing" 4½ inches in diameter, is made in which the parts O, O, of Fig. 26, may revolve. K, K, are small pieces of board one inch thick nailed to the piece A, in order to cut away less of the piece by the "boxing". The center of this boxing should be nine inches from the end of the piece A, and half an inch below it, that is, on a line drawn through the centers of the boards K, K. L is a piece of iron bent so as to form the remaining part of the circle and extending about six inches on each side, so that it may be bolted to the piece A, as shown in the cut. The pieces A, A, should be 40 inches apart from outside to outside. B is two inches thick, 12 inches wide and of the form shown in the engraving. It forms a seat for the driver. F is two inches thick and six inches wide. It must be sunk into the pieces A, A, until it is "flush", or even with them. Its back edge must be just far enough from the "boxings" to allow the piece C of Fig. 26 to pass, a little over 24½ inches from their centers. G is one inch thick, four inches wide, and about 43 inches long. It is fastened at one end only, with its back edge one inch nearer the "boxings" than that of the piece F. A guard, H is placed across the other end of it, which leaves it free to be drawn forward about three inches. H is a curved spring, one end of which rests against G, while the other end is fastened to a piece, E, placed across the frame. C is a lever 18 inches long, from the center of which a cord extends back to the piece G. D, D, are heavy iron bolts put through the frame 17 inches from the front end.

In using the rake, it is connected with a wagon, the bolts, D, D, being hung over the hind part of the wagon. C of Fig. 26 rests on G of Fig. 27, and thus prevents the rake from turning until the driver by means of the lever at his side, draws the piece G forward far enough to allow it to pass. A small piece of iron may be put at each end of C, Fig. 26, and also on the piece G (Fig. 27), where that piece rests. This prevents it from wearing so rapidly.

S. P. SHULL.

A HANDY SCRAPER.

Mr. Joseph Todd, of North Madison, Ind., writes us that he finds the scraper shown at Fig. 30 a very handy implement. It is made from a worn-out cross-cut saw, with a broken fork handle for the handle. The blade is 12x5 inches. A hole is made in it, through which the tang of a broken fork is driven into the handle and fastened. The blade is secured to the shank by riveting while hot, or by a thread and nut. The teeth are good to get manure from grass or to loosen hard cakes on the floor of the stable. Such a tool for use about a stable or pig pen is almost invaluable. It costs but little and is easily made.

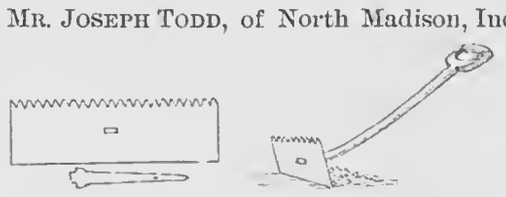

Fig. 30.

Pomological.

A NOTE FROM PRES. LYON.

FALSE PRETENSE IN HORTICULTURE.

Brother Collins is so delightfully candid in his advocacy of the principle of false pretense in marketing fruits, as applied to the Lawson (Comet) Pear, that I am impelled to turn the matter inside out, and look at it from different standpoints.

But first, in self-defence, I may be indulged in the statement that Mr. Collins, in person, presented specimens of this pear before the committee of the American Pomological Society, at Grand Rapids, Michigan, on the 10th of September last. The specimens were apparently in perfect condition; not at all decayed; and I cannot recall any statement to the effect that they had essentially suffered in quality from having been kept. On testing, the quality was so utterly indifferent that a very moderate taste sufficed.

I had no previous personal acquaintance with the variety, and knowing that the Sterling is usually marketed, in Michigan, as early as the end of August; and ought, in New Jersey, to be from one to two weeks earlier, I felt warranted in the supposition that they cannot greatly differ in season.

Mr. Collins does not venture a word in favor of his pear, so far as quality is concerned; but puts it (as he always does the Kieffer), forward, strictly upon its beauty, saying, "It did not concern me what was done with the pears, whether they were sold for their good looks or good quality." So say a great many fruit-growers who grow and sell worthless fruit, which, by its beauty, begets the expectation of quality in the mind of the innocent and ignorant buyer. So says the man who deliberately puts up his fruit in wine quarts and sells as dry quarts, or in peck baskets that turn out but six quarts, or in "flour barrels" that measure out half a bushel short. So also says the man who puts fine specimens on the top and bottom of his packages, while the center is made up of refuse. All these processes operate upon the horse jockey's principle—"Your eyes are your chap;" and are addressed to that frailty so common with human nature—the endeavor to buy cheap, with the vain hope of getting more than one's money's worth.

I am aware that it is often difficult to draw the line that shall separate honesty and fraud; and that even an honest man may, perchance, become so far befogged by self-interest as, unconsciously, to step over the line. Still, as between the man who sells beautiful fruit, knowing it will be overrated in quality, and him who ekes out his packages with refuse, I can see no difference save in degree, since all aim to lead the buyer to hope to secure more in his purchase than can possibly be realized.

The beauty of this fruit will doubtless sell it for a time to those who know nothing of its quality; but it will be folly to hope that the same buyers will continue to call for it, or that it can, if extensively grown, ever be recognized as a favorite in the market.

HOW CAME "COMET" PEARS IN THE MARKET?

Noticing the article of my friend Collins, in the Rural New-Yorker of December 26, as to the "Comet" (?) Pear, I would ask him one question: "How is it the "Comet" has borne from year to year and sold at from $4.00 to $8.00 per bushel," when *he* cannot have a tree in bearing? I was on Mr. Caywood's grounds three years ago last Fall, and he then had one oldish tree and a *few* young trees in bearing, certainly not enough to bear *over* six to eight or ten bushels of fruit. He tried to sell me the stock and control of that sort, claiming that *not a cion or tree had gone out of his hands.* I understood the next year he sold his "right" to Collins, which makes it but two years last Fall since he got any young trees. How is it my friend Collins has had such remarkable success in marketing the fruit as $4.00 to $8.00 per bushel? As I said, Mr. Caywood tried to sell me the stock; but I certainly saw nothing in the fruit but its bright color to recommend it. In flavor it was almost third-rate in comparison with such sorts as Bartlett or Seckel. A. M. PURDY.

Palmyra, N. Y.

PEACH TREE BOX.

Mr. R. P. McNalley sends us the sketch shown at Fig. 31. This simple little device is said to prevent the depredations of the peachborer. It has stood the test of several years' trial. It is simply a box of four pieces of plank, about 15 inches long, of wood that will not easily decay. It is made around the tree and sunk an inch or two into the ground. Thus the moth, from which the borer is produced, is unable to pass under. The side of the box should not be more than two or three inches wider than the trunk of the tree. As the trees grow the boxes can be replaced by larger ones. The spider that is almost sure to spin its web at the top of the box provides ample protection where the box is small.

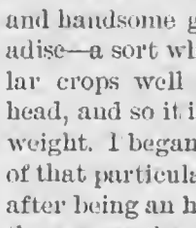

Fig. 31.

THE SWEET PARADISE.

Apples are considered to be more nourishing than potatoes, which require other food with them to render them satisfying to bodily needs. Apples are medicinal too; a noted physician used to say that he used no medicine himself but apples and abstinence, whenever he felt out of sorts. Sweet apples are more nutritive and more grateful to a tender stomach than sour, and comparatively few know how excellent many sorts are, cut, sliced and baked. Baking imparts a much richer flavor than stewing. Some years ago I planted an avenue line with that exceptionally erect and handsome grower, the Winter Sweet Paradise—a sort which carries its heavy and regular crops well in the interior of its stately head, and so it is not bent out of shape by the weight. I began to think I had too much fruit of that particular sort, but find them so good, after being an hour in the oven, that I value them more than ever, and I can readily sell any superabundance in this region of mines and works. G.

Tyrone, Pa.

Horticultural.

RASPBERRY-BLACKBERRY HYBRID.

Mr. Wm. Saunders, of Canada, during a brief call at this office, spoke of hybrids which he had effected between the raspberry and blackberry. We find in late English papers a new "pure black raspberry" offered, which purports to be such a cross. It is called the "Glenfield." It will be seen by the cut (Fig. 28), that it is larger than any black-cap, though smaller than the average blackberry. The advertisement reads: "By crossing a blackberry with a raspberry, a fruit partaking of the

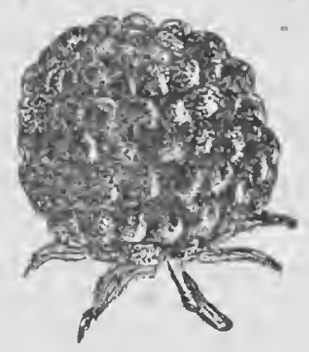

Fig. 28.

shape, flavor and habit of the raspberry (with just a perceptible and unusually pleasant taste of the blackberry)—with the glossy black color and hardy character of the last-mentioned—has been obtained; while as regards productiveness, etc., it will vie with the very best raspberry yet known." This seems not, as yet, to have been alluded to by American journals.

The Apiarian.

SIXTEENTH SESSION OF THE NORTH AMERICAN BEE-KEEPERS' ASSOCIATION.

(RURAL SPECIAL REPORT).

Continued from page 25.

Increased demand for honey; extracted and comb honey; Winter bee feed; when to extract; fumigating; our honey markets; honey packages; honey plants; shipping bees; buying bees.

In continuation, Mr. Walker said he had found it was more difficult to sell 500 pounds of honey is 1868 than 35,000 pounds in 1885. He sells more to the 1,500 people of his town to-day than was sold in all St. Louis 20 years ago. With less labor at least twice as much extracted honey can be secured, and four times as many colonies can be cared for as when we work for comb honey. The cry of over-production is not well founded. We find no trouble in disposing of our immense crop of extracted honey. Let every bee-keeper see to it that all the markets are supplied—not a fifth now even know what extracted honey is.

Dr. Mason, of Toledo, Ohio, after a faithful trial of both, is loud in favor of extracted honey. He only extracts from the brood chamber. Dr. Whiting, Michigan, said, "Tier up, and you will secure at least double the quantity of extracted honey." Mr. Dadant wishes at least 12 Langstroth frames for brood chamber, and extracts from half stories above, using one, two or three, as the harvest requires. Unless we give much room we are likely to be annoyed by swarming.

C. F. Muth uses double-story Langstroth hives. He has secured 193 pounds per colony on the roof of his store in Cincinnati. He urged all to keep honey enough for winter stores, and not to feed sirup. Mr. Pettit, of Canada, agreed with Mr. Muth that there was loss in feeding sirup. If we feed honey for Winter, that eases the market by just so much. Several present thought it paid well to feed sirup for winter stores. It was thought that sirup was as safe or safer and cheaper than the honey.

Mr. Root says we must plan to work less, and even though we make less honey we shall receive more money. Many manipulate too much for the best profit. Feed no sirup, and permit the bees to do their own spreading of brood. Never so crowd the bees as to cause enforced idleness. No good bee-keeper ever permits his bees to hang in idle clusters outside the hive. Mr. R. uses 10 to 16 combs in the brood chamber, and extracts from the upper story. The queen sometimes goes above to lay, but this does little harm. He has a six by twelve inch ventilator in the center of the bottom board, which was very useful in hot weather. Mr. Pettit said no honey should be extracted till capped. It should always be cured in the hive. Prof. Cook said we save much time by extracting before the honey is capped. The honey, if kept in warm, dry rooms, in open vessels, would be just as good. He had repeatedly given such honey ripened out of the hive, also that ripened in the hive, and that drained from first-class comb honey, to people to test, and they rarely decided against the first, if it was well ripened. Mr. Hotterman, of Canada, would have honey ripe before extracting; would extract when the honey was about one-third capped. He found clover and thistle honey ripened much quicker than basswood honey. Honey, both comb and extracted, should always be kept in warm, dry rooms. Mr. Broadman said the cap was air-tight, so how could it injure comb to be kept in damp rooms. Prof. Cook said the caps were not air-tight; even comb honey

would evaporate and thicken with age, which it could not do if the cells were impervious. Comb honey would also absorb moisture and become thinner in a damp place. Crystallization is not due to evaporation, but to a law, and is hastened by cold, and is often attended by expansion, not contraction. Crystallization also varies. Some honey is quick to granulate, others slow, and some does not crystallize even in our coldest Winters.

Mr. Hall said unless honey had some pollen in it, there would be no trouble from moths. He fumigated by putting sulphur on a very hot iron. If coals were used they must be wholly charred so as to emit no smoke. Sulphur fumes alone could never injure the taste of honey, and would only color the propolis or pollen. Mr. Newman, Ohio, said even comb honey was improved in quality by allowing it to remain on the hive for a time; although it would be darkened a little, it would be enough better to pay.

Mr. C. F. Muth then presented a paper on our markets. The low price of honey is due, not to over-production, but to general depression. There is not a surplus of honey, nor is there less consumption. Times are hard and people will not pay large prices. There is no speculation. All trade is dull. Extracted honey has become a staple article in the market. Adulteration, which is rarely, if ever practiced by bee-keepers, is carried on by dealers, and is doing much to injure the markets. The pork packers of Cincinnati are now taking large quantities of extracted honey. They found the New Orleans molasses too uncertain, often lacking sweetness. Honey is a most excellent substitute for cane sugar.

We can quicken the market by insisting that dealers shall stop adulteration, and by practicing care and neatness. Have no dirt about the apiary. Use only new, clean barrels. Charred barrels injure honey. Whisky barrels are very bad. Honey in one-pound sections sells best though there is a demand in some places for two-pound sections. Mr. Heddon said he could get just as much honey in one-half pound sections, and could get three cents more per pound for it. The sections must have full sheets of foundation so as to go to market without injury. Mr. Manum of Vermont, shipped this year to Boston, and sold 11 tons of one-pound sections while two tons of two-pound sections were being sold. He said the one-pound would sell best, and if all would use this size the sections could be procured cheaper. They could then be had for $2.50 per 1,000, while now they cost $4.00.

T. G. Newman, Illinois, urged the planting of honey plants; a succession of honey plants the year around was very desirable. Alsike and Sweet Clover were both highly praised. Mr. Newman, of Ohio, had furnished bass-wood trees to all in his village, and to farmers close by who would plant and care for them. He found he had done very wisely. Others had found it paid well to furnish Alsike Clover seed to farmers.

Mr. Hayhurst, Kansas City, showed that shipping bees by the pound was very profitable both to buyer and seller. He always sent a queen along, gave good ventilation, fed with good candy, and sent several packages in a single crate. The bees should not be allowed to gorge themselves with honey just before being caged. Four ounces of good candy each day per pound of bees, are enough. A pound of bees with a queen could be sold in May for $3—not for less. These will make a good colony before the season ends. With care, even a half pound of bees will make a good colony. He sold to an Iowa man, last Spring, 11 one-pound packages of bees with queens. They were put on to three frames each, fed a little, and gave him 400 pounds of comb honey besides enough to winter the bees.

Mr. A. I. Root said buying bees by the pound was a good way to start an apairy, and to restock after winter losses. Mr. Hetherington had secured five good colonies in a single season from a single pound of bees with a good queen.

What Others Say.

THE POTATO OF THE FUTURE.—Prof. Lemmon proposes to create the potato of the future by using the original species, selecting those found on the mountains and plateaus of the Southwest. He selected Solanum tuberosum and Solanum Jamesii as most promising. The first slightly resembles some varieties in cultivation. It is ascending in habit, about two feet high, or less, with mostly simple stems, lanceolate-oblong leaflets; large purple flowers, followed almost surely by abundant bolls of seed. The tubers are produced upon long, slim white stolons, and are depressed oval in shape, from one-half to one inch in diameter, and of a purplish color when first exposed to the light. Solanum Jamesii is usually smaller, with prostrate branching stems, larger and narrower leaflets (the minute interposed ones being fewer), a less number of flowers to the umbel, which is white and more deeply incised into lobes. The stolons are usually much shorter, and the tubers are smaller, nearly round, and when first dug are of a beautiful snowy white. Both species were found growing side by side in Southern Arizona. They had even pushed their way into the few gardens in that region, as though friendly to cultivation, and inviting attention. These wildings were sent about the country for trial. Many cultivators pronounce them utterly worthless as potatoes, while others find the size somewhat increased by cultivation, and a few are of the opinion that these little wildings will yet prove the means of producing some of the earliest and best of potatoes.

POTATO EXPERIMENTS.—Mr. Edmund Hersey gave, before the Mass. State Board of Agriculture, the results of numerous experiments. Small "seed"—the product of small potatoes planted from year to year, gave better results than large potatoes cut to an average of two eyes. The seed ends gave a larger crop than the stem ends. Potatoes from Nova Scotia used as "seed" were 50 per cent. more productive than home-grown tubers. The speaker would not have the farmers take his experiments as a guide for themselves, as the character of different soils and climates greatly affects all crops. It was to discover a principle rather than to formulate a rule that he had worked. If land be very poor, small cut pieces must fail, as the plant will starve before it is strong enough to draw sufficient nourishment from the soil, while in a very rich soil, planting whole large potatoes may be wasteful. Hilling is advisable on wet land, level culture on dry. The cause of scab is a conundrum. Two years' work showed that scabby seed caused scabby crops, but the third season the reverse was shown. An overdose of nitrate of soda brought potatoes entirely free from scab. The permanent shape of potatoes cannot be changed by selection. Permanent changes must come through the crossing of plants in the blossom. The crop may be greatly affected by using sound or unsound tubers. Potatoes for planting should not be exhausted by growing sprouts in Spring to be rubbed off by handling. Large crops are possible only on land that is fertile and well cultivated.

STARCH IN THE POTATO.—The English Farm and Home says the potato is the most prominent among starch foods. The boiling breaks up the starch granules and makes the little nitrogenous material more soluble. Potatoes cooked in their skins retain more of the potash salt and to this extent are more valuable as food. Potatoes that cut soap-like have become waxy, some of the starch having been rendered gummy before the granules were broken up. One reason why the Irish prefer potatoes boiled in their skins is that the system thus gets its demand for potash salts, which are furnished sufficiently to others by salads, fruits and other vegetables. Potatoes while essential as a part of a mixed diet, are not nearly so valuable for food as many imagine. Two-and-one-half pounds of potatoes have only the nitrogen of three-quarters of a pound of bread, and the carbon of one pound. Potatoes to be as cheap per pound as bread should cost less than one-third as much. It is especially so with laborers who require strong nitrogenous food. In a comparison of nitrogen, one pound of oat-meal is worth six pounds of potatoes. For those inclined to eat too much flesh they serve for dilution as in the stew.

THE POTATO IN THE SOUTH.—The Farmer's Journal notes the fact that one merchant in Sumner County, Tennessee has handled 4,000 barrels of Tennessee raised Irish potatoes the present season, second crop. He paid out among farmers over $9,000. The potatoes were shipped to Kentucky where they are preferred to any other for spring planting. The variety was the Early Rose. The Southern papers have long advocated the growing of the potato as a profitable crop for their section. At present the poorer classes of people eat very few potatoes. The effects of an exclusive "hog and hominy" diet are plainly visible throughout the South, in a race of sallow-faced dyspepties who worship the frying pan. The introduction of the potato among the poorer people at the South would be an inestimable boon. The crop is hard to save in such a moist climate, yet it is thought that it could be secured in as good condition as the ordinary sweet potato. In 1884 the Gulf States with 13 per cent. of our total population, produced only 3,066,465 bushels of potatoes or 1½ per cent. of the total crop. December 1st the price per bushel in these States averaged 96 cents, against 53 cents as the average of the whole country. For years it has been said that beef and butter never could be produced in paying quantities at the South. Events have proved the folly of this assertion. The potato culture of the future may tell the same story. All that is needed is a better system of storage.

POTATOES AS FOOD.—Prof. Atwater, in his admirable lecture on the Chemistry of Foods, gives some suggestive figures as to the nutritive values of potatoes. The average composition of the tuber is given as 75.5 per cent. water, .2 protein or flesh-forming material, .2 fat, 20.7 carbohydrates, .8 woody fiber and .1 mineral matter. It is far below beans and peas in nutritive value, but superior to turnips, sweet potatoes, cabbage, carrots, etc., etc. As to digestibility, experiments in Germany show that the percentage of dry food in potatoes lost as excrement was 9⅛, of beef 5; of eggs, 5¼; of rice, 4; of cabbage, 15; of bread 5½ and of milk 8 to 10. With potatoes at 50 cents per bushel and other foods at corresponding prices it was found that 25 cents would purchase, in pounds.

Potatoes.	Protein. .59	Fats. .06	Carbohydrates. 6.06
Beans	1.16	.11	2.69
Wheat bread	.49	.11	3.03
Salt cod	.57	.01	.....
Pork (salted)	.04	1.19	.....
Beef (round)	.29	.11	.....
Cheese (skimmed)	1.20	.21	.28

The average ration for an ordinary man is given as .26 pound protein, .12 pound fat and 1.10 pound carbohydrates. The average cost of a pound of protein in potatoes at 50 cents per bushel is 14 cents; in beans 14 cents, oat meal 15, corn meal 12, salt cod 38, mackerel 80, ham 48, corned beef 56. These figures show that potatoes are a cheap and serviceable food, but they are by no means a "perfect food," and will be most valuable when used in combination with other foods richer in protein. Prof. Atwater calls attention to the fact that in every section where the people confine themselves to one kind of food, as rice in China, the potato in some portions of Ireland and Germany, and pork and corn meal in some parts of the South, they are, as a rule, ill-nourished, and suffer physically, intellectually and morally. The evil results following an exclusive use of the potato as food are remedied, in some cases, by the use of milk eaten with them, or by the eating of beans fish or oatmeal, all rich in protein.

MARL.—Prof. Kedzie, of the Michigan Agricultural College, has issued a bulletin on "Marl," in which he says that the value of marl depends almost entirely upon the amount of lime it contains. A good way to form a fair estimate of this is to use a solution of one pound of muriatic acid to one quart of rain water; pour a cupful of this over a tablespoonful of the supposed marl; if it effervesces, it is marl; if not, probably it is a clay; and its value depends upon the proportion that is soluble. A very simple way to distinguish between marl and clay is to place a lump in a glass of water; if marl, it will crumble down into a diffuse mass; if clay, it will remain unchanged. He says: "When marl is applied to the soil it destroys the acid condition, decomposes the sulphate of iron which is sometimes present to an injurious degree, and affords the alkaline condition in soils so necessary for nitrification and the preparation of plant food. Its application will be particularly beneficial to soils that are light and sandy, containing a fair supply of vegetable matter; on soils that run to moss and Bunch Grass and on those so open and porous as to prevent fruitfulness. It is also very beneficial on soils having an excess of vegetable matter, such as cleared "cat-holes" and muck beds. To secure the full benefit of marl, it should be near the surface; in fact, it should be finely pulverized and mixed with the surface soil. A good method of securing the necessary fineness is to throw it to the surface and expose it to the action of the frost." He has found it paid to mix a small proportion of salt with the marl—say, eight to ten per cent. on heavy clays. On sands entirely destitute of humus he thinks it would do little or no good. The dose of marl he would recommend is from 30 to 100 bushels per acre, and there is no danger of injury to the land by an "overdose," as it is mild in form and has none of the burning properties of lime.

SAMPLES AND COMMENTS.

S. C. PATTEE would sooner pay $1.50 for good corn meal than 15 cents a bushel for potatoes for feeding purposes. Straw and potatoes are not suitable to be fed together, because they both contain an excess of carbonaceous matter. He would substitute cotton-seed meal for potatoes every time, because the cotton-seed meal contains an excess of albuminous or flesh-forming matter, and should always be fed with something which contains an excess of heat-forming elements.

A CORRESPONDENT of the Midland Farmer, as an experiment, planted the sprouts that broke off the seed potatoes. They mostly grew in some places too thickly and had to be thinned out, but they made a crop of rather small potatoes. This shows that in scarcity of seed, or with new varieties, much may be done to save seed. These had no coaxing or special care, but were treated like the general crop. The vines were all the season more delicate and spindling than from the sets, but their growth is among the "easy possibilities."

IN the culture of the wild potato by the Indian squaw, the tubers are neither planted nor cultivated. They are simply dug. The largest only are put in the basket, while the smaller ones, or those too deep or too far from the hill are alone left to perpetuate the species, and small potatoes on long stems are the legitimate result of such culture.

KEEP the farm animals happy, is the good advice of the Times

THE same journal remarks that experience has shown that a permanent laborer with his family comfortably lodged in a cottage on the farm, and with a small garden for his own use to work in his spare time, is worth far more to his employer, as compared with a transient workman, than the use of the house and the land comes to.

MR. THERON E. PLATT writes to the Homestead that, after careful microscopic examination, he is convinced that scab in potatoes is caused by fungus growth, and not by attacks of worms and insects.

THE practice of cutting the tubers for seed planting is condemned in the report of the California Academy of Science, as tending to the ultimate degeneration of the plant. Though the potato continues to give fair crops after such treatment, it only proves what great natural vigor and power of resistance this wonderful plant possesses, and what Christian forbearance it displays when thus vilely assasinated decade after decade.

THE original habitat of the potato has been discovered as being in two regions equi-distant from the equator, north and south. It is thought that the northern species of Arizona and New Mexico should be expected to give us a better, stronger tuber, than the long-cultivated foreigner, from the low sea-coast of Chili.

IN his paper on the Indigenous Potatoes of North America, read at the meeting of the Horticultural Society, at New Orleans, Prof. J. G. Lemmon stated that the common potato had been nearly blotted out of existence from our fields and gardens once, and, under present modes of treatment, it is believed, it may be at any time destroyed. The potato is America's best gift to mankind, being next to wheat in rank among the plants in the whole world. It can be said to grow wherever man can live. It is pre-eminently the poor man' bread. On several occasions it has averted famine over wide regions of the earth. Certain districts have been able to sustain twice the population they could have done without the potato.

WE have already begun to mail our seed distribution

IF one-half of what we have heard regarding the everbearing qualities of the Earhart Raspberry be true, it is the most desirable black-cap known.

THE Michigan Tradesman has been investigating the losses caused by the "red streak" in Late Rose potatoes, noticed by Prof. Beal last week. It is said that the defect has killed the shipping demand for the Late

Rose in Michigan, thus rendering it neeessary to consume the crop at home. In localities where the local demand is small, the only course left for the farmer to pursue is to feed his crop to his stock, and this is being done in hundreds of instances. The loss to the shippers and growers of the State will undoubtedly exceed $100,000. ....

PROF. WAGNER publishes analyses in support of his conclusion that steamed potatoes are far more nutritious than boiled ones. In the process of boiling, the vegetables give up considerable portions of nutritious salts, while they also take up more water than when steamed, and become proportionately weaker.

A SINGULAR sort of manure for potato fields has been introduced on a Pomerian model farm. Hitherto herrings and potatoes have been known as a palatable dish in family households. The manager of the farm in question has hit upon the idea of blending them from the start, by planting his seed potatoes with a herring placed in every heap, and with so decided a success as to cause him to increase the area thus planted from 20 acres last year to 60 in the present one. The expense he calculates at about nine marks ($2.25) per acre, which is cheaper than the cost of any other kind of manure, and amply repays the outlay. Of course, it can only be employed near the sea coast .....

THE Western Rural advises farmers to feed potatoes occasionally. The small refuse potatoes will do the sheep, and especially the breeding ewes a great deal of good. There is no use that can be made of small potatoes that will do as well as for the feeder. Cut them up and sprinkle meal over them. The object to be gained is principally to furnish moisture, and where grain is being fed, to furnish bulk. The potato is highly valuable for furnishing bulk to ourselves. In fact, that is the greatest value it has as an article of food .....

A WRITER in the Country Gentleman, who witnessed the horrible effects of the potato rot in Ireland in 1847, says that the black, putrid vines covered the soil; the earth was filled with rotten tubers, and the stench was almost overpowering, even to those who had been used to the wards of a large hospital and to the odors of a dissecting room. Dead corpses lay on the roadsides, wretched cabins became the vaults in which whole families lay dead and decomposing; dead mothers were to be seen as they had sat on the roadside, nursing their infants, which still hung upon the cold breast. There is no danger of our witnessing such a spectacle in our own country, yet a total destruction of the potato crop throughout New England would produce untold suffering.....

IN the book, "How the Farm Pays," Mr. Crozier says he would rather feed potatoes to cattle than to sell them for less than 40 cents per bushel. Both Mr. Crozier and Mr. Henderson oppose the practice of cutting potatoes to single eyes. Mr. Crozier finds the best success where large potatoes are cut straight through, from top to butt in two pieces....

Everywhere.

RURAL SPECIAL REPORTS.

California.

CARPENTERIA, Santa Barbara Co., Dec. 29.—The winter season never commenced more favorably in California for the farmer. About the middle of November we had a very fine rain for seven or eight days, which gave us over 10 inches of water, and during December enough more to make 12 inches up to date. The weather has been warm, so grain and grass have a fine start. Most of our crops were light on account of dry weather during the growing season. Prices low, but we have plenty of the good things of life and no reason to complain. Some of the apple trees are in full bloom and many bushels of apples are still on the ground and trees. O. N. C.

Illinois.

ANNA, Union Co. — The Thousand-fold Rye and Diehl-Mediterranean Wheat almost all froze last Winter, but I gathered about one dozen heads of rye and enough wheat to yield about half a pint of grain. The crossed corn did not succeed. Carter's Stratagem Pea did fairly well. J. M. F.

SHELBYVILLE, Shelby Co.—Some of the Rural peas were the largest I ever saw. The beans were nice but rather small. Corn excellent. Saved seeds from all to plant. The Garden Treasures were an extra-nice mixture and did well. I rather think we shall have to give up Sorghum halapense, as it failed to show itself. VAN D.

Indiana.

MEXICO, Miami Co., January 5.—We are having a very mild, open Winter. Stock of all kinds in prime condition; health good. Growing wheat looking well. Market lower than at any time since thrashing. Wheat 85 cents; corn of good quality, 30 cents. N. B.

Kansas.

ELK FALLS, Elk Co.—We have taken the "RURAL" two years and think it the best agricultural paper we have ever seen. We were visited in the Spring by a terrible flood, which destroyed all the crops in the valleys, to say nothing of property washed away and stock drowned. Further on in the season a destructive hailstorm passed over a part of our locality; and, lastly, the web-worm came to complete the destruction, so that Winter finds us importing corn from other localities to feed stock, which is at such a low price, that many farmers will be broken. M. E. N.

FLORENCE, Marion Co., January 1.—We had the finest Fall I ever saw—very pleasant and warm. We had about two weeks of winter weather, and six or seven inches of snow in the fore part of December. Snow all gone now. Weather fine; roads good. Crops of all kinds were good; but prices are very low. Cattle, about three cents per pound; hogs, three cents to three-and-one-half cents; corn, 35 cents; oats, 20 cents; hay, $2.00 per ton, in stack; butter, 20 cents; eggs, 20 cents; potatoes, $1.00; apples, $1.00 to $1.50. The Rural seeds did well, except the beans. J. J. A.

FORT SCOTT, Bourbon Co., Dec. 29.—We are having an old-fashioned Winter in Kansas—warm and pleasant. But little rain since October, and farmers secured their corn in good order. Corn, 30 cents per bushel, oats, 20 cents; wheat, 90 cents. Business good; money a little tight on account of low prices of stock; good steers, 3½ cents; hogs, 3½ cents; fat sheep, three cents; potatoes, 40 cents to 60 cents; apples, 40 cents to 60 cents; butter, 30 cents; eggs, 20 cents.

Maryland.

EASTON, Talbot Co.—We had a very favorable season for seeding wheat; area seeded up to the average, and the crop looks well. Relying upon the good judgment and candid statements of the RURAL, several farmers of Talbot were encouraged to try the Diehl-Mediterranean Wheat. It proved hardy, vigorous, ripened "on time," and yielded more than Fultz grown on the same farms. I seeded none but the Diehl-Mediterranean, and know of others who did likewise. I expect to follow the advice of the RURAL, and select heads from the field. My wheat is now in a very robust condition. I used a drill tooth attachment, which works on the principle of a sled runner, covering the grain at a uniform depth with fine soil, and the plants all appeared at the same time. Mine was corn ground, plowed and dressed by the Aeme harrow, and drilled two ways. The fallow-like appearance of my field, I attribute to the regular track of the drill teeth, the shallow and complete covering of the seed, which could not have been done on freshly plowed corn ground, with the drill teeth jumping and delving from "none" to several inches deep. This improvement or "reform," I might call it, will greatly increase the yield of wheat together with the new hardy variety above mentioned. I have many things to thank the RURAL for, among which are the Beauty of Hebron and Blush Potatoes, together with several valuable varieties of garden seeds.

"Y."

Massachusetts.

BECHERTOWN, Hampshire Co—The cross-bred corn grew to all sizes, both stalks and ears; some flint, some dent, some early and some late. I have saved a very handsome string of it for seed. The peas, beans and tomatoes did well and are mostly saved for seed. Garden Treasures were very pretty and much admired. E. R.

WESTFIELD, Hampden Co.—Last Summer I tested the Rural method of planting potatoes with level cultivation with good results, having raised Rural Blush Potatoes at the rate of 500 bushels per acre. The yield was twice as great as I had ever grown on the same land by the old method of planting and cultivation. Land a light sandy loam. The potatoes were very fine and free from scab. From observation in previous years, I believe that scab is caused by the potato slug. I notice that where the slug is allowed to eat off the leaves in the latter part of the season, the vines die prematurely. J. L. S.

Michigan.

CALKINSVILLE, Isabella Co.—The Rural corn grew all right, but was too late. Some of the stalks had six ears set, but it would require 150 days from planting to mature. The Prince of Wales Pea did well; saved all for seed. The Rural New-Yorker Pea of two years ago is the earliest and most prolific of any I have ever tried. The Horsford Market Garden is better flavored. The Flageolet Beans are very prolific and whiter than the seed sent me. In flavor they are not as good as Lima. Winter wheat is looking very well, but has a small top. Farmers could not sow early on account of wet weather at seeding time. The Diehl-Mediterranean Wheat did very well last year; I had nearly one peck and took extra care to put it away from the hens; but the mice ate half of it. I sowed the balance and it is looking splendid. The tomatoes grew finely, but were of poor flavor and rotted badly. Times are very hard. Everything farmers have to sell is low. Wheat, 80 cents; oats, 30 cents; hay, $8.00 to $10.00 per ton; potatoes, 25 cents per bushel, about half grown here rotted. R. M.

BATH, Clinton Co.—The White Elephant Potato is a big cropper and in good demand; price from 25 to 30 cents a bushel. My Surprise Wheat can't be beat; it takes the lead of anything here. I sowed all I had last Fall—about nine bushels. Cleveland's Rural New-Yorker Pea is good. The Black Champion Oats are too late. Of the Rural corn for 1884 some yellow dent was early and good; some wanted 12 months to mature in. The Garden Treasures were not very interesting.

W. C.

SCHOOLCRAFT Co.—The Rural seeds did very well, except the mixed corn, which grew too large to mature. Prince of Wales Pea very fine; also the Johnson Grass. T. C.

SUNFIELD, Eaton Co.—The Rural mixed corn was too late for this section. The beans, peas, tomatoes and Garden Treasures were tip-top. W. S.

SOUTH LYON, Oakland Co.—Wheat, 86 cents; corn, 40 cents; oats, 35 cents; potatoes, 30 cents; clover seed, $5; butter, 15 cents; eggs, 20 cents; live hogs, $3.25; poultry low. Beans dull, at about $1. Wheat went into Winter looking bad. Farm stock, except good horses, are lower than for several years. H.

Minnesota.

GROVE LAKE, Pope Co., Jan. 4.—My Blush potatoes did well. I now have 75 bushels. The Rural wheat and rye were winter-killed. This is a spring wheat county. The corn and oats were too late. Mixed corn ditto, but the beans and peas did very well. The Garden Treasures were very nice. I raised 32 bushels of the Saskatchewan Wheat to the acre.

D. S.

Montana.

FRIDLEY, Gallatin Co.—I have resided here nearly three years, and find the climate and everything else agrees with me. The people East have always been ignorant of the climate and soil of Montana, especially of the Yellowstone, Gallatin, Jefferson and Madison Valleys. We beat the world here on wheat, oats and barley. Gallatin County, this year, will average over 40 bushels of wheat to the acre. I have seen some fields that ran over 60. The past season has been grand for all kinds of crops. Corn is not considered a safe crop, but the past season it would have done well as we had no frost from May 1 until September 10. I raised plenty in the garden for home use and had splendid tomatoes. Wild raspberries, wild currants and gooseberries grow here in abundance; so do wild strawberries. But the farmers here have heretofore given very little attention to gardening, as their dollars were in cattle and horse raising, which has been a very profitable business, and a first-class lazy man can attend to a large herd. All he has to do is round up in Spring and Fall, and brand and select out such as may be wanted for sale or use. The surrounding ranges feed them with the fine Bunch and Rye Grasses that grow bountifully. One party near me has 1,500 head of horses and mules on the range. Another party has two or three thousand head of cattle. Almost every one has some. B. P.

Nebraska.

CRETE, Saline Co.—My mixed Corn did finely. Corn as a general thing was good. I had 150 acres which averaged 50 bushels per acre. My Blush Potatoes did splendidly. I never saw better. The RURAL Tomatoes did well. Corn is not nearly all gathered, and is cheap—18 cents. Clover and Timothy do well here—quite extensive crops. M. B. N.

SYRACUSE, Otoe Co.—Some of the Rural corn was early; some late; all got ripe; but it is too small for a field crop. The peas were nice. Most of the tomatoes were small. The The King Humbert was very fine-flavored—the best I ever ate. D. E. S.

New York.

HOWELL'S, Orange Co.—The Diehl-Mediterranean Wheat is something remarkable; the heads beat anything I ever saw. It wintered out badly, but what there was is fine. It was the finest wheat shown at our county fair, and there was a good exhibition of other varieties. The King Humbert Tomato is not worth raising; it would take about a thousand of them to fill a peck measure. Corn this season is good. The cross-bred corn was of all varieties and sizes. I counted four ears on some stalks; some ripened early, and some did not ripen at all. The Thousand-fold Rye is no better than, if as good as, the rye raised in this section; it wintered out badly, and what was left, both straw and heads, proved to be short. Flageolet Beans tough and stringy; of little use for the table. The Peas were excellent; the hens preferred them to all others. H. B.

VOLNEY, Oswego Co., Jan. 6.—The past Summer was cold and wet. Grass and oats pretty good crops. Corn light and not matured. Potatoes rotted badly; some fields not worth digging—worth 40 to 50 cents per bushel. Butter 16 to 18 cents per pound. Eggs 20 cents per dozen. Winter quite open, only a few days' sleighing in December. Snow falling again this morning. H. C. H.

Ohio.

ATWATER, Portage Co., Dec. 28.—From the RURAL'S Diehl-Mediterraneon Wheat I got about three quarts, which I sowed this Fall and it is looking quite well. The corn is, most of it, too late for us. Crops the past season were about an average. Owing to the wet, cold Fall, corn did not ripen well, so much of it is soft. Apples were plentiful at from 75 cents to $1.20 per barrel. Wheat now brings 90 cents. O. M.

BELLEFONTAINE, Logan Co.—The Rural corn ripened from September 1st to October 1st, but the grain and ears were almost all too small, though this was partly made up by the number of ears, ranging from two to five. The Prince of Wales Peas were very fine and productive. The Stratagem did not do so well, being late. The beans were almost a failure, although grown with the peas. The Rural corn of 1884 tried this year, ripened early and was fine—only a little too flinty. The Market Garden are A No. 1, very productive and extra in quality. M.

WAYNESVILLE, Warren Co.—The Rural Corn ripened but it is too small for this locality; will not yield anything like the Leaming. The peas mildewed badly. The tomatoes were very fine. The beans are not as good as some we have; The Cleveland Rural New-Yorker Pea is best with us. J. L. S.

Pennsylvania.

CLARK, Mercer Co., January 2.—We had a very wet Autumn and the fields and roads were so soft much of the time that farmers were greatly hindered with their work, and considerable corn is yet in the fields. The hay crop was about an average. Oats good. Wheat very poor. Potatoes rotted badly, which left a light crop. Price 40 cents per bushel. Corn, only an average crop, 25 cents per bushel. Beef, plenty and cheap—five to seven cents per pound by the quarter. Pork plenty, about five cents per pound. Butter, 20 cents; eggs, about the same. An average crop of wheat sown; looking well. N. L.

GOSHEN, Lancaster Co., January 1.—The Rural peas and beans did nicely. The corn did not amount to much. The Garden Treasures were splendid, there being many varieties of flowers we had never seen. N. H.

SCOTTSVILLE, Wyoming Co.—The past season was one of the worst for a number of years. Corn about half a crop and worth 50 cents per bushel. Oats, 40 cents; wheat, $1; potatoes, 40 cents; hay, $13 per ton. Cattle plenty and very cheap—can't be sold at any price Rural corn too late for this section; other seeds did well. Tried a small plat of potatoes on RURAL plan and raised twice as much as I did by the old way. J. G. F.

MUNCY, Lycoming Co.—The Stratagem and Prince of Wales Peas were very fine, we have saved all for seed. The Flageolet Beans were very nice. The Garden Treasures came up well, but the cold rains killed many of them.

J. R. B.

Rhode Island.

GLOUCESTER, Providence Co.—The Rural corn all came up well, but the "farmer's friend" pulled up every spear. Peas did very well. Tomatoes all killed by frost about September 1st. The beans promised a large yield, but a woodchuck ate off all the leaves, and the beans ripened before they were grown. The Johnson Grass grew about five feet high, but one spear was seven feet nine inches in the main head, being the only one that matured. Blush and White Elephant Potatoes were very nice and gave a good yield. The Beauty of Hebron, Pearl of Savoy, King of the Earlies and Early Rose were so badly affected with scab that out of 60 bushels I only got eight bushels smooth enough for market. Many of them were covered with blotches or scab so thickly that not a spot of the skin was to be seen, and where they were left on the ground, in a week they had all perished, leaving nothing but a little dry, hard lump. All of these potatoes were planted in the same field; the two first kinds were smooth and handsome, yielding 114 bushels. "L."

Tennessee.

RICEVILLE, McMinn Co.—Our wheat crop was not more than a quarter of an average. I sowed one bushel each of the Mediterranean and Landreth's White Wheats; they stood the Winter all right, while other kinds were more or less winter-killed or frozen out entirely. The mixed corn is not of much account, ex-

cept for early table use, the larger dent varieties yielding better. The peas and beans did well. Corn is worth 40 cents; wheat 90c. to $1; oats, 25 cents; hogs, 3¼c. per pound; cattle, 1½ to 3c; butter, 15c.; eggs, 17c.; other things low. About the usual area sown to wheat; looks well. W. C. D.

Vermont.

BAKERFIELD, Franklin Co., Jan. 2.—The past year was rather cool for some crops, especially corn, squash, cucumbers, etc., but our corn was a fair crop. The vine crops were rather poor; but the potato, oats and wheat crops were good. Produce is selling very low. Butter, 15c. to 18c.; potatoes, 35c.; oats, 1c. a pound; pork, 5½c.; beef, 5c.; apples, $1.50 per barrel; hay, $12; old cows, from $5 to $10. The Rural corn did not ripen. The R. N.-Y. peas are two weeks earlier than any grown around here. Flageolet beans are truly wonderful. N. O. S.

Wisconsin.

FRANKLIN, Milwaukee Co., Dec. 31.—The Rural Union Corn (1884) is a very remarkable variety; it is the best corn I have ever seen; very large kernels. Everybody who sees it must have an ear, so I have put it away and do not show it. The Dichl-Mediterranean Wheat stood the Winter very well, when my other wheat, within a rod of it, was all winter-killed; yield one quart. The Thousand-fold Rye was splendid; yield three quarts. The Welcome oats I lost by breachy stock. The Garden Treasures gave good satisfaction—but that is the women's department in my household. R. B.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time.]

SWINE PLAGUE, HOG CHOLERA.

J. K., Beattie, Kans.—What will stop the cough in my hogs? They will lie in piles and shiver as though freezing, and when driven off, they will cough very hard. They lose appetite, and die in two or three weeks. On opening them, I find the greater part of the lungs decayed in some, while the lungs of others are badly congested.

ANSWERED BY F. L. KILBORNE.

Your hogs are evidently dying of swine plague, and that form of the disease in which the lungs are the seat of extensive lesions. The lung-worms—Strongylus paradoxus—are generally considered to be harmless to swine, while their absence in some cases would show that they were not the cause of death in the present case, and only incidental when they do occur. It would be well to examine the interior of the large intestines, especially the cœcum or blind pouch, and about the ileo-cœcal valve, where the small intestines join the large, and if ulceration is found, or in recent acute cases only deep reddening of the mucous membrane, the disease is swine-plague. Treatment of the sick animals is very unsatisfactory, as well as unprofitable, except perhaps in the case of very valuable breeding stock. They remain so long unthrifty, usually from several months to a year or more, that it is better to kill all diseased animals at once, and direct the attention to preventive measures to check the further spreading of the disease. Separate the healthy from the sick, and remove them at least several rods away to windward, if possible. Feed twice daily in the food of each animal one year old and older, 20 drops of sulphuric acid and one-half dram of sulphate of iron. Pigs three months old may receive one-eighth, and those six months old, one-fourth of this amount. If treatment of the sick animals is desirable, they may receive the same dose. Watch the healthy animals daily, and remove any showing the first signs of illness. Any pen not yet infected, and all new arrivals, should be very carefully guarded, so that dogs, rats, fowls, or other small animals cannot pass from the sick to the healthy. If possible, have a special attendant to care for the healthy animals; otherwise always care for the healthy first and the sick last, and then do not go near the healthy again until necessary to feed. Give special attention to the hygienic surroundings of the animals: the pen should be clean and comfortable; the food wholesome. It is better not to allow the animals the run of a yard, because of the difficulty of disinfecting it. All dead animals and their products should be deeply buried or burned. Disinfect all infected pens as well as everything else with which the sick animals have come in contact, with a two-per-cent. solution of sulphuric acid, one-half pint of the strong acid to each three gallons of water.

BEANS, OATS AND BARLEY; PEAS.

J. C. S., York, Pa.—1. What kind of beans are most profitable for field culture, and what is the average yield per acre? 2. Would you recommend oats or barley as the most profitable crop? 3. What is an average yield of peas grown as a field crop?

ANS.—1. There are five varieties of beans that are grown as field crops—the Medium, the Pea or Navy, the Marrow and the Red and White Kidneys. There is more fluctuation in the price of Red Kidneys than in that of any other, and when grown at such a time as to strike the market at the top, there is plenty of money in a crop of them. The same is true, to a limited extent, of the White Kidney, and to a still less extent of the Marrow. The Medium is the great staple bean of the markets, and has the most uniform sale, and we think it is, all things considered, the best bean to tie to as a field bean. Its yield varies much with the soil and season, and will run from 10 up to 40 bushels under the most favorable circumstances. Contrary to the opinion that any land is rich enough for beans, they respond always to manure and rich land. 2. Whether we would grow oats or barley, would depend upon soil and markets. A light, sandy soil that, made rich, would grow 75 or 80 bushels of oats per acre, probably would not grow 20 bushels of barley, and that of light weight; while a heavy clay loam, well enriched, will grow almost as many bushels of barley as of oats (a great many more pounds). We have raised on the Western N. Y. Farm over 73 bushels of Manshury Barley per acre. The safe way is to try an acre or two; you would then know just which your land was adapted to. 3. From 12 to 40 or more, the yield depending upon the soil, its richness, and much on the season.

GYPSUM.

N. L. H., Flora Vista, N. M.—I am desirous of gardening here, and manure is hard to get, but we have an abundance of white gypsum—a compact, earthy substance—and I would like to ask; 1. Is this class of gypsum of as much value as a fertilizer as manure? 2. Should it be mixed with the soil or used on the surface? 3. In what quantities can it be used? 4. Is not such gypsum a valuable article of commerce, and how much is it worth in Eastern markets?

ANS.—1. We are half inclined to doubt its being gypsum at all. We have seen large quantities of a similar substance in Southern New Mexico, which was a sort of marl. If so, it is worth more as a manure than gypsum. But gypsum is not worth a tithe as much for manurial purposes as stable manure. It only pays on certain soils and certain crops, and no one can tell whether it will pay or not except by actual trial. 2. Gypsum pays best used as a top-dressing and applied when the crop is in active growth. 3. It is usually applied at the rate of about 100 pounds per acre, which pays about as well as more. 4. Gypsum is used quite largely in the East, and is worth from $3 to $8 per ton ground ready for use. The gypsum here is found in the rock form, sometimes in large boulders and at others in compact ledges. It is broken up and ground to a very fine powder, in mills similar to grain-grinding mills.

EARLESS CORN-STALKS.

A. F., 114 E. 52d st., New York city.—Why do many stalks of corn which grow rank and strong and of full hight have tassels but no ears?

ANS.—There is no mystery in this. Corn, like many plants, has its male and female blossoms on separate parts and sometimes on separate plants. The ear is made up of a cob on which are arranged the female blossoms, one for each kernel, and the silk is the pistil, which must receive the impregnating influence of the pollen in order to have the grain develop. The pollen is borne on the tassel, which contains the male flowers from which it is shed. In all fields some stalks bear only tassels and no show of ears whatever, being male plants, called by the farmers "suckers," and unless cut out, or at least unless the tassel is cut off before shedding the pollen, the tendency is for these to increase. The best way to raise seed corn is to select a part of the field and from this, as soon as the tassels appear and before they shed their pollen, cut the tassels, not only from the male plants but from every plant that has not two or more well developed embryo ears. In this way the male parent of every kernel selected as seed for the next crop, will be a two-ear-bearing stalk. And, as like begets like, this has an effect on the succeeding crops.

TREATMENT OF A PEACH ORCHARD.

J. T. K., Hickory?—1. Should a five-year-old peach orchard be cultivated every year? 2. How should the trees be trimmed and when? 3. Would it be well to top-dress the orchard with stable manure? 4. Is soft soap a good wash for the trees?

ANS.—1. No matter how old the orchard is, the land on which it stands should be cultivated every year. 2. After the trees are five years old or more, the principal trimming they need is to cut out broken and dead branches, keep the top in shape, and, if too thick, thin out moderately. 3. Yes and also apply plenty of wood ashes, and if light land, bone dust. 4. Yes; but not so good as if it were made of caustic soda and water.

"HOOKS" IN A HORSE.

J. O. L., Monteithville, Va.—Is it likely that the eyes of a two-year-old colt will be permanently injured by "hooks" removed a year ago?

ANS.—"Hooks" is an inflammation of the haw, or membrana nictitans, which passes over the eye from the inner corner to clear it from foreign matter. This membrane sometimes becomes swollen and the lacrymal duct is obstructed, causing severe tenderness in the eye, and sometimes sympathetic fever. It should never be "removed," as the cutting of it ont deprives the horse of a necessary organ. In the present case any injury to the eye now may be due to the "removal" of the haw a year ago. Give an animal troubled with "hooks" one pound of Epsom salts, and apply to the diseased part, with a camel's-hair pencil, the following solution: one dram of sugar of lead and ten grains of morphia in half a pint of water. Protect the eye from strong light and use the lotion freely.

EXTRACTING HONEY.

V. K. (address mislaid).—How is honey extracted from the comb?

ANS.—By means of an extractor, which is a round, deep tin cylinder like a barrel, inside of which an axle is placed, upon which rests a rack or frame to hold four or more combs. By means of gearing, the rack is rapidly revolved and the honey thrown from the comb by centrifugal force. Prof. Cook states that the principle which makes the machine effective was suggested to the original maker, a German, by noticing that a piece of comb which was twirled by his boy at the end of a string was emptied of its honey.

Miscellaneous.

J. C., Oil City, Pa.—Can bones be ground to fit them for fertilizing purposes, fresh as they come from the butcher shops? If so, can they be better fitted in any other way?

ANS.—Bones in this condition contain much oil and some meat, and these make them very difficult to grind, and while the lean meat and muscles have considerable fertilizing properties, the fat and oil are of no use whatever. It is customary to steam the bones and thus extract the fat, after which they are dried and afterward ground. If to be used fresh, they may be broken quite fine and reduced with ashes or manure.

R. R., Herman, Minn.—1. Should night-soil and wood ashes be mixed as a fertilizer? 2. Are ashes a good fertilizer for potatoes?

ANS.—1 Never, except they are also mixed with plenty of muck or loam, as the potash of the ashes would set free the ammonia of the night-soil; this is arrested and held by the soil. 2. Ashes, bone dust and salt are all good fertilizers for asparagus; so also is plenty of barnyard manure; put it over the surface of the beds in the Fall, and fork it in in the Spring.

T. M., Raymond, Dak.—I have a mule that is lame in the hind leg. From all I can make out, the whirlbone is partly displaced. I have been using liniments and latterly cantharides and turpentine, but the ailment does not seem to improve. It has been so for two or three months. Can anything be done for it?

ANS.—Any displacement should have been replaced as soon as possible after the injury. Now it would probably be impossible to do so without a surgical operation, and perhaps not even then. The only hope is to consult a competent veterinary surgeon if possible.

F. B. M., New York.—1. How much capital would be needed for starting in poultry raising as a business? 2. What are good works on the subject?

ANS.—1. We would not advise anybody to invest heavily in poultry raising at the outset. The business is very risky for a novice. Better begin in a small way, and as your experience increases, increase the business. 2. Lewis' Practical Poultry Book, $1.50; Wright's Illustrated Poultry Book, $17.50; Wright's Practical Poultry-Keeper, $1.50, and Tegetmeir's Poultry Book, $9, are all good, and can be had through the American News Company.

C. D. C., Black Mingo, S. C.—I have a hermaphrodite hog which I claim to be the only living hog of that sort; am I right?

ANS.—Moustrosities are probably more common among swine than among any of the other domestic animals, so that hermaphrodite animals should not be very uncommon. We have seen a number of monstrosities of pigs of various forms, but have never had our attention called to a hermaphrodite pig.

C. B. H., Hobart, N. Y.—Is there such a thing as passing electricity through milk to separate the butter and save the labor of churning?

ANS.—We have seen such an announcement, but have no knowledge of its being made practical. For the present at least we guess you will have to turn or swing the churn either by hand or some other power.

S. W. G., Westchester, Ind.—Where can I get red Bush Alpine Strawberries?

ANS.—You will not find it easy to get them—at any rate in quantity. Ellwanger & Barry, of Rochester, N. Y., usually keep a few on hand to oblige customers, as do also Hovey & Co., of Boston, Mass. The running Alpines are much easier to get, both red and white.

J. A. S., Howenstine, O.—Where can I get the Imperial Egg Food?

ANS.—From J. M. McCullough's Sons, Cincinnati, O.; the Plant Feed Co., St. Louis, or F. C. Sturtevant, Hartford, Conn.

R. S. C., Harman's, Md., wants information about the Hoffman Seedling Strawberry, which, he says, is grown around Charleston, S. C. Who can furnish the information through the RURAL?

DISCUSSION.

N. I. S., WEST SPRINGFIELD, MASS.—I run a large cider mill, and find the talk in the papers about the value of apple jelly, comes from men who know more about writing up the jelly than they do about making it. It is very difficult to make a good apple jelly at a profit. The cost of making exceeds the price at which it is sold. In the open-pan evaporation of the cider from unassorted apples of different flavors, either sour or sweet, there is a great difference in the product, to the sight as well as to the taste.

C., FLUSHING, L. I.—Is not the Live Stock Indicator, page 847, in error in stating that at the public sales the past year the average price of Herefords as $343.14, and of Shorthorns only $92.31? In the reports that I have seen of these sales the prices averaged only a little higher for Herefords than for Shorthorns, while in England the case has been reversed. A great boom was run up by the breeders of Herefords from about 1880 to 1884, but since that time the price has fallen rapidly, so that in England, particularly, they may now be bought for little above butcher's prices for fat cattle. C.

R. N.-Y.—The Indicator referred to the sales in the West, mostly in Kansas and Missouri.

THE ROSTIEZER PEAR.

A. B. A., FLUSHING, LONG ISLAND, N. Y.—Mr. Parnell, page 845, says that although this pear is one of our finest summer pears, and quite indispensable for home use, he does not think it would be of any value for market purposes, on account of its small size. The case is quite the contrary where I am situated, for it is the only sort I can sell at any profit. Ripening so much earlier than nearly every other kind, it comes into market before them, and is eagerly purchased by the people of the village near me. It ripens here about the middle of July, just as raspberries and blackberries begin to fall off, and before peaches and summer apples are fit for eating. Thus there is no other fruit of consequence to rival it, and it sells at a good price. Later on, pears are so abundant they pay no profit, except in a very scarce year. The clusters on my trees are so numerous that I pick, or rather cut off, two-thirds of the fruit as soon as the pears get to be about a half-inch in diameter; even when they come to ripen, I generally think too many have been left; for in a very strong wind the branches are loaded so heavily they occasionally break, and thus mar the shape of the tree. The trees are very hardy, grow thriftily, and bear abundantly in a poor sandy or light gravelly soil, requiring to do this only a little stable manure spread around them each Autumn.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, January 23, 1886.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Home

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JANUARY 23, 1886.

Subscribers of the RURAL *need never take the trouble to write us to "stop" the paper. It is invariably discontinued at the expiration of the subscription term, except by oversight, in which case it is our loss.*

READ the catalogue notices on page 61.

WE will gladly send our new posters to all who apply.

IF the number on your address label is 1878, your subscription expires with this number; if 1879, next week; 1880, in two weeks, etc.

THOSE who would like to have a glimmer of Spring in their sitting-rooms should cut sprays of such hardy plants as the Japan Quince, Forsythia (Golden Bell), cherry, etc., and put them in water. They will bloom in a few weeks.

ALL who subscribe for the RURAL NEW-YORKER are entitled to its Free Seed Distribution on application. No others need apply, for the reason that our supply of seeds is necessarily limited. Enclose a two-cent stamp, please. We are obliged to pay on the present packet four cents.

THE thermometer at the Rural Grounds at 7 A.M. the 13th instant was 12 below zero. As there is scarcely any snow on the ground, this will prove a test Winter as to the hardiness of many of the newer grapes, raspberries, blackberries, shrubs and trees.

WE presume that some of the RURAL's readers, as well as others, have gone a little crazy over the chrysanthemum. We shall attempt to aggravate this pardonable disorder by presenting some engravings from nature of a few of the latest and best novelties of this showy flower, with articles from experienced growers.

AGAIN, friends of the RURAL, we must ask you not to feel slighted that many of your questions have not been answered. Indeed, they *have* been answered, but we can not, without neglecting other departments, find space for them. We trust that all questions and answers will appear in due time. As a matter of fact, if the RURAL were twice as large as it is, we should still find it difficult to publish all the contributions received, well worthy of publication.

WE earnestly solicit our subscribers, in renewing, to write their names, post offices, counties and States *plainly*. Our new posters and specimen copies will be sent promply to all who apply, without charge, and with our best thanks for the interest so shown. We beg to remind our readers that *now* is the time to secure clubs. A kindly word from good people as to the merits of the RURAL must always have its effect. We prize the opinion of conscientious men.

As between the Spanish and Japan Chestnut, for the climate of Chicago and New York, extending south and a little north, do not fail to select the latter. The nuts are not quite so large and the average is fewer to a burr, but the quality is better and the tree is *hardier*. Probably the seed will be offered for sale by some of our seedsmen, in which event we shall promptly notify our readers. The Japan Chestnut fruits in a few years from seed, and, whether for ornament or fruit, is worthy of a place on every farm.

THE Stratagem and Pride of the Market Peas (both "English, you know"), were introduced at about the same time. Both were tested at the Rural Grounds, and the Stratagem was deemed the more valuable of the two, and, accordingly, placed in the Rural's last Free Seed Distribution. It is now rated in catalogues as the best main-crop pea in cultivation. Some catalogues are now announcing the Pride of the Market as a novelty. But those of our friends who have the Stratagem need not care for the Pride of the Market.

ALL who subscribe for the RURAL, and of course, our regular subscribers, are entitled to the RURAL's Free Seed Distribution upon *application*. Others need not apply. A two-cent stamp should accompany the simple request "Send Seeds." We trust that those who do not care enough for the seeds to plant and give them good care and report to the RURAL how they succeed, will not apply. Our stock is necessarily limited, and the seeds are too valuable to be thrown away. The object of these seed distributions is to enable our subscribers to test in a small way the latest and most promising novelties without incurring any expense.

LET us once more advise those of our readers who are intending to plant evergreen trees next Spring, *not* to select the Balsam Fir. It is among the brightest, showiest trees of the nursery, and, when small, always well clothed with its deep green foliage. But it will disappoint you, friends, as it grows older. It is beautiful and promising in youth, but gaunt and unsightly as it grows older. One plants in the expectation of having, in 15 years, shapely trees that are a joy to look at. But the Balsam Fir, as a rule, is so far from ornamental at that age, that it is better to utilize it as firewood.

A CONSIDERABLE time ago, the RURAL bought a package of Hammond's Slug Shot, and, at the request of a subscriber, sent it to the N.Y. Ex. Station to be analyzed. The Chemist of the station in its last report says: "The indications are, that it is no more nor less than London-purple, mixed with a very large proportion of gas or slaked lime."

Mr. Hammond is now sending a postal card to seedsmen with the sworn statement that "at no time has either London-purple, slaked lime, or gas lime entered into its composition." If the Chemist of the station made the statement without a careful examination of the Slug Shot, he is certainly a careless and inefficient officer. If Mr. Hammond has sworn falsely, the public should know it at once.

THE NEXT POTATO SPECIAL.

THE Second Potato Special of the RURAL NEW-YORKER, to be published before March, will have articles from the following contributors: Prof. I. P. Roberts, Farm Manager, Cornell University, N. Y.; F. W. Wilson, Wilson's Nurseries, Chatham, Ont.; Peter M. Gideon, Minn.; Prof. L. H. Bailey, Mich. Ag. College; Frank Ford, Ohio; Col. F. D. Curtis, N. Y.; Thos. Barrett, Ills.; E. J. Brownell, N. Y.; E. Z. Butcher, Kansas; C. Harris, O.; E. G. Mumford, N. Y.; E. Horner, Colorado; A. W. Russell, O.; C. Calkins, Colorado; Prof. A. J. Cook, Ag. Coll., Mich.; A. Van Valkenburgh, N. Y.; F. H. Plummer, Maine; Geo. H. Colvin, Pa.; Pres. T. T. Lyon, Mich.; Lewis S. Ely, Iowa, and others if space permit.

PRIZES.

TEN DOLLARS

for the largest Bird Cantaloupe from the Seed of the RURAL's present Free Seed Distribution.

TEN DOLLARS

for the largest Watermelon.

TEN DOLLARS

for the longest ear of the Angel of Midnight Corn containing the greatest number of kernels.

TEN DOLLARS

for 10 of the heaviest pods from the Alaska Pea.

The Prizes will be awarded October 1st, 1886. All competitors will be required to advise us as to the weight or size of their peas, melon, or corn by postal card. Those who take the prizes will then be required to send the peas, corn, or melons by express at the RURAL's expense.

A RIGHTEOUS ACT.

SECRETARY LAMAR deserves the thanks of the country for the decision just made, which accords with the wishes of the RURAL, as expressed some time since on this page. He consents to have suit brought, in the name of the Government and at its expense, to vacate the Bell telephone patents. Of course this decides nothing, but it will fully test the claims made, and which, we believe, are well founded, that these patents were obtained by fraud and are, therefore, invalid. If so decided, this much used and almost indispensable convenience will become public property, and competition will furnish it so cheap as to enable everyone to enjoy its use. There is no doubt but that the Bell Company has already taken from the people more than one hundred millions of their hard-earned money. Now, if it shall be shown that there is no validity in these patents, will it not be a fact that the people have been swindled out of this money? And is not some blame to be attached to the Patent Office for allowing the patents on insufficient evidence?

ORIGINAL ENGRAVINGS.

IT is very plain to us that a large proportion of readers do not appreciate the cost of illustrating a journal; that is, of course, with *original* illustrations. Second-hand illustrations, such as we see "going the rounds," may be bought for a song, really costing less, in most cases, than the type-setting required to fill the same space. Not only has the RURAL to pay its artists and engravers, but the specimens to be drawn and engraved have to be procured often at a considerable cost in time and thought. Besides, most of the plants, whether grain, fruits, shrubs, trees or flowers, are first grown and tested at the Rural Grounds, as our older readers are fully aware.

During 1885 we presented, in all, 600 engravings, of which not less than 450 were drawn and engraved for this journal, while the others were reproductions of the best illustrations to be found in our foreign exchanges, in which latter case we have merely had to pay the cost of re-engraving. But the entire cost probably adds between three and four thousand dollars annually to the expenses of conducting the R. N.-Y.

These cuts, after they have appeared in our columns, are practically valueless. It is true we could sell many of them for one-tenth of their cost, and this, in exceptional instances, we have done—only, however, to see them "going the rounds" as *original* engravings in other papers, which, in this way, appropriate, at a nominal expense, the credit which fully belongs solely to the R. N.-Y.

NOVELTIES.

MANY writers advise farmers not to test novelties. "It will be time and money thrown away." Our own advice is to test them in a small way—cautiously, so to speak—but *test* them. If one kind of potato will yield on your land but 100 bushels to the acre, while another will yield 200, would it not pay you to test 25 varieties in a small way to find this out? If one kind of corn will yield but 25 bushels of shelled corn, while another will yield 50, would it not pay you to plant a dozen different kinds in small plots to find this out? And so with wheat, oats, roots, grapes, raspberries, strawberries, etc., etc. Perhaps 90 per cent. of the so-called "novelties" are no better than old kinds. Our claim is that it *pays* every gardener, fruit-grower, florist or farmer to select what seems to be the most *promising* of the novelties, and to test them in small plots, taking the chances of thus securing improved varieties which will pay for themselves and the trouble and expense of raising them.

We have perhaps 50 or more different raspberries growing at the Rural Grounds. Were we to raise them for *profit*, all but about five different kinds would be destroyed. We have a dozen or more different kinds of blackberries. These would be reduced to two or three. We have perhaps 75 different kinds of grapes. These would be cut down to half-a-dozen. And we should carry out the same ratio of rejection among our wheats, oats and vegetables. Now how are we thus enabled to select the plants best adapted to our soil and climate? The answer is, by testing novelties beside the best of the standard kinds.

It appears to us that the advice not to test new plants or seeds comes from those who either have had an exceptional experience, or none at all.

A BOARD OF AGRICULTURE.

NEW YORK'S PRESSING NEED.

NEW YORK is emphatically the "Empire State," with a total length of over 400 and a total breadth of over 300 miles. She has a greater diversity of scenery, a greater variety of soils and climates, and produces in abundance a greater number of "agricultural" products than any other State, and yet, with these advantages, she does comparatively nothing to develop these resources, or to instruct her soil tillers.

With the best dairy soils and climate, and the richest grasses and purest water in the world, she allows the cheese of Canada and the butter of Illinois, Iowa and Wisconsin to outsell in her own markets the productions of her own farms, simply because these sections have, and she has not, afforded the dairymen the facilities for obtaining the requisite knowledge to enable them to make first-class goods.

With her grain fields starving and yielding annually diminished crops for want of manure, she allows millions of pounds of feeding stuffs, rich in both animal and plant food, and thousands of half-fattened cattle and sheep to be sent to the sea-board cities and the Old World markets, passing directly by the doors of thousands of her empty barns rotting idly down, solely because her farmers lack the knowledge of the conditions necessary to enable them to profitably finish fattening these animals on those foods in such a way as to leave a profit of at least the plant food, to be used upon their impoverished fields. There is not another State in the Union that has not done more for its farmers, and scarcely another, however small, that has not a live and efficient Board of Agriculture, constantly looking after the improvement of its agricultural methods and resources; and a score of States, notably Michigan and Ohio, are now each holding a series of Farmers' Institutes especially for the education of their farmers. Surely, the great State of New York, with its quarter of a million farms and a half million farmers, should take a foremost part in fostering the interest of that class the products of whose labors feed the people and enrich the State, without detracting from any other interests.

WE ought to have a live Board of Agriculture, whose business it should be to increase the productiveness of our farms by instructing our farmers in the newer and better methods of soil culture, dairying and stock feeding. And each Winter there should be held, under the direct auspices of this Board, not less than 30 Farmers' Institutes in the 60 counties of the State. And in these Institutes the farmers of each section should be instructed in the particular branch of farming adapted to their section, by experts who have proved their competency by a success in that particular branch. In this way the butter and cheese makers of the dairy districts will be kept in the front rank of progressive dairymen; the potato, fruit and grain growers of these respective regions will be taught how to produce the largest crops, and in every part such men as have made a success of winter stock-feeding, should be called upon to show New York farmers how to make meat, money and manure at one and the same time.

We hope that every paper in the State which is friendly to the farmer's interests will make it a point to urge this matter; and that those members of the Legislature who would do something to advance the solid interests of the State, will see to it that a bill is presented and speedily passed establishing this much-needed institution.

While money is being wasted by the million in piling up a needless conglomeration of stone, brick, mortar and iron, under the pretense of building a "capitol," let us have a few dollars appropriated to establish and maintain a Board of Agriculture, which shall do something to instruct the farmers how to grow better crops, enrich their fields and better manage their farms, thus aiding the best interests of the whole State.

BREVITIES.

OUR friends should look over the advertisements and send for the catalogues therein announced.

MONEY sent in letters for subscriptions to the RURAL NEW-YORKER is at the sender's risk. Our terms are invariably $2.00 a year in advance.

WE wish that the RURAL's Avery Sewing Machine might be in the home of every one of our subscribers. We look upon it as the most valuable premium we have ever offered for so low a number of subscribers. We do not hesitate to commend it as the best machine manufactured.

A COMMON way of building grape arbors in Connecticut, is to bolt an upright post to a slab set in the ground, with cross-bars in the usual way. We have noticed arbors that have evidently been in place for years, yet showed no signs of decay or of breaking down. As a matter of course, arbors can only be built in this way where suitable stone can be obtained for the foundation. The method of construction is very simple: the slabs are bored near the surface of the ground and again near the top, and the upright posts are attached by bolts either keyed or screwed fast. An arbor properly built in this way would last a life-time.

Indust'l Societies.

NOTES FROM THE WINTER MEETING OF THE CONNECTICUT BOARD OF AGRICULTURE.

(RURAL SPECIAL REPORT.)

Bran and "fine feed;" saving and keeping fruits; Connecticut game laws; Canadian milk and cattle feeding experiments; grasses for permanent pastures; hints as to cattle feed; milk for cities; agricultural fairs; experiments with fertilizers.

THE nutritive and manurial value of wheat bran was discussed by Dr. Jenkins. The husk of spring wheat is brittle, rich in gluten and difficult to separate, just the opposite of winter wheat, but the bran of the latter is the richest, containing about five per cent. less digestible matter than fine feed. New-process bran contains one per cent. more phosphate and three per cent. more protein than old-process. Bran is cheaper at $18 per ton than middlings or fine feed at $20, and contains 48 pounds of nitrogen per ton. Twelve tons of bran contain 576 pounds of nitrogen, 340 pounds of phosphoric acid and 760 pounds of potash—as much as is contained in three tons of dried fish—to say nothing of its value as feed—an important consideration. It requires considerable faith in chemistry to believe coarse bran, as commonly sold, contains more nutriment than the finer grades.

Saving and keeping fruits was the topic treated by pomologist Augur. He advocated giving the best, plenty of it, and of the best keeping varieties. Half the battle is to have well-grown specimens free from insect blemishes, to gather early and carefully, avoiding bruising, discarding interior samples and feeding them to stock. Cold storage should be more extensively employed. Evaporating will be found profitable. Apple jelly is a profitable product and, with canning now so popular, we can have these healthy products of the soil on our tables, in some shape, the year round, much to our health and profit.

The game laws of Connecticut were shown by Mr. Kelly to be enacted in favor of irresponsible sportsmen and pot-hunters, and the New York markets are largely benefited by receiving the game that rightly belongs to the farmers of Connecticut. He pleaded earnestly for the birds, and denounced, in well-merited terms, the wholesale robbery of the nests under the plea of making cabinet collections of no benefit to any body. The crow came under this ban; as it is guilty of destroying more eggs and young of robbins than all its good works can atone for.

What the cattle have said relative to food for 10 years past, was an interesting topic treated by Prof. Brown, of Ontario, Canada. The figures from his experiments represent the average of tests during a series of years not from one cow, but from three, four and more. It will be noticed that while the Hollands are noted generally for their yield of milk, it the lowest in quality. [Numerous other experiments in the United States show much more favorable results as regards the quality of Holland milk.—EDS.]

Another curious feature shown is that the Jersey stands not only at the head of the list for butter, but for cheese also. [Tests in other places have given very different results also.—Eds].

Breeds.	Per cent. of butter in 100 lbs. of milk.	Per cent. of butter from 100 lbs cream	Per cent of cheese from 100 lbs. milk.	Chemical analysis of milk. Total. Fats.	solid.
Jersey	5.1	55.	15.6	6.62	11.65
Ayrshire	4.5	43.5	12.9	5.72	13.53
Short-horn	4.1	41.6	11.	4.99	13.99
Short-horn grade	3.7	46.3	11.9	4.03	12.38
Devon	4.3	48.5	11.9	4.13	12.15
Aberdeen-Angus	3.5	38.	10.1	2.87	11.57
Guernsey	2.5	41.5	11.7	3.60	11.80
Holstein	2.3	34.5	10.9	3.73	11.88
Galloway	2.3	31.	11.7	4.58	14.28

The accuracy of these tables will doubtless be questioned. The lecturer himself was surprised; but he could not explain them away. They were the facts, and must stand till displaced by other facts deduced in like manner. It required three acres to maintain one cow in pasture for the season. One acre represents 1,300 pounds of milk on pasture, against 900 pounds per acre this side the line. His mixture of grasses for permanent pasture is:

Meadow Fescue	6 lbs.	Meadow Foxtail	1 lbs.
Red Top	2 "	Orchard Grass	3 "
Kentucky Blue Grass	2 "	Timothy	1 "
Italian Rye Grass	1 "	or English Rye	1 "
Yellow Oat Grass	2 "	White Clover	3 "
Lucerne	5 "	Red "	1 "
Alsike	2 "		
Yellow Clover	1 "	Total	36 lbs.

On a farm of 400 acres he has 20 acres in roots—sweeds or rutabagas mostly—and expects a yield of 22 tons per acre. After four years' trial of ensilage, he had abandoned it on account of its objectionable effects on the milk. He avoids fine ground feed; coarse or cracked grain is better. Oil cake is fed cracked to the size of hickory nuts, or larger. He thinks cattle masticate it better in that condition, and more thoroughly incorporate it with saliva and coarser food. He feeds cattle for beef about six months, and prefers two-year-olds—not profitable to feed longer.

Prof. Brewer, treating of the milk question for towns and cities, urged absolute cleanliness and the prevention of any foul odors or impurities being absorbed by the milk, and thus conveyed to the human system. Skimmed milk is by no means innutritious or unwholesome; but it should be sold for what it is. Connecticut has no law on the subject.

A paper on agricultural fairs took the ground that if the fat woman and other sideshows, as well as horse racing were necessary to induce people to visit the fair where they might perchance see and receive instruction from contact with other things, have them by all means. If fine music is needed to draw people to church, when they are there the ministers have the material to hammer and mold into such shape as they please. The State of Connecticut contributed about $7,500 and the people $45,000 for the support of the fairs, and the benefit, if any, must be educational. In defence of horse racing and such attractions, a Danbury fair manager stated that at their cattle show the first day they sold 800 tickets. The cattle were then taken away, and the next day came the horse trotting, etc., with a sale of 16,000. This was necessary to make the money to pay the premiums awarded on the cattle. The entry fees for trotting sometimes pay the premiums; hence there was no loss to the society: while cattle and agricultural exhibits were admitted free. One exhibitor was charged $15 for his vegetable display, because he wished to have it where it could be seen. The manager replied it was his own fault; had he been content to go with others of his class, it would have cost him nothing. The situation assigned for this class of exhibits was said to be an obscure, out-of-the-way place totally unfit for the purpose, and the attendants at the horse trotting were not farmers; but jockeys, sports, dudes, and their fast lady friends from the towns and cities all over the State and beyond. From developments I judge Connecticut is fully up to the standard in the management of *modern* agricultural fairs.

Mr. Fairchild detailed his experiments with fertilizers and believed in getting his chemicals and mixing them himself, though he saves this labor by applying each ingredient directly to the soil, trusting to cultivation to do the mixing. He found that without potash he could get no crops at all. Phosphoric acid, nitrogen and potash were the chief elements necessary, the latter especially. A farmer ought to know enough of his business to know what he wants better than the merchant does; but a great many farmers ask the merchant what they need, and the latter of course recommends the particular brand he is interested in. The farmer should know and demand what he wants regardless of the merchant's advice.

Mr. Bartholomew found on his soil that phosphoric acid was the absolutely essential element he needed, except with potatoes; he could dispense with this crop but not for corn. There are those who want prescriptions for their soils, as they have neither time nor inclination to experiment: but both speakers urged them to conduct experiments themselves; they would find it useful, instructive, interesting and profitable; and in no other way could they arrive at satisfactory conclusions.

The concluding paper was addressed to the young folks of the farm by Mrs. Slosson. Its title "Open Your Eyes" was an appeal to young folks to observe more keenly the more common and every-day objects around them, for in them lie hidden and unnoticed a storehouse of useful knowledge and beauty. The grasses, weeds, flowers and bushes of fields and meadows afford abundant means for study and observation. The method of treating the subject was quite as applicable and interesting to the older and mature minds of those present, as to those for whom it was prepared, and ought to be quite as beneficial. E. W.

THE NEW YORK FERTILIZER AND CHEMICAL EXCHANGE is the name of a new organization among the manufacturers and dealers in fertilizers and fertilizer materials. The object of this organization is to promote sociability among its members, and a free consultation on all points which will secure uniformity and a high grade in the fertilizers put upon the market. Many of the extensive manufacturers and the leading dealers have already become members. The first meeting of the association was held in New York early in December, and the following board of officers was elected: C. V. Mapes, President; John Kehoe, Wm. H. Bowker, and Wm. H. Reed, vice-presidents; Geo. B. Forrester, Treasurer, and John T. Williams, H. J. Baker, R. G. Kirkland and A. S. Malcomson, Directors. This seems to be a move in the right direction, as the members of this association will be quite likely to make their brands of fertilizer of a uniform grade, and they will each have a direct interest in seeing that the inferior grades are kept out of the market. In this way, we can see how this association can be of real benefit to the farmers as well as to themselves. It is hoped that all the leading manufacturers will become members, and that the farmers may be able to get just what they buy. If there is one thing in which they have been cheated more than in anything else, it has been in the quality of the fertilizer which they have bought.

PENNSYLVANIA STATE BOARD OF AGRICULTURE.—The annual meeting of the Pennsylvania State Board of Agriculture will be held at Harrisburg, Pa., on Wednesday and Thursday, January 27th and 28th, 1886. The very important matter of fences and their relations to the farm and farmer, will be fully discussed. It will be a very important and interesting meeting, and all who can, should attend. Further information will be furnished by Thos. J. Edge, Sec'y., Harrisburg, Pa.

WISCONSIN DAIRYMEN'S ASSOCIATION.—The 14th annual meeting of the above associa will be held at Richland Center, Wis., for three days, commencing Tuesday January 26, at 10 o'clock A. M. A very rich and varied programme has been prepared by the Sec'y., our friend D. W. Curtis, of Ft. Atkinson, Wis., who will gladly furnish a printed circular of the meeting. Every butter and cheese maker of Wisconsin should be in attendance. It is time to wake up the dairy interest and crush the bogus butter business.

WESTERN NEW YORK HORTICULTURAL SOCIETY.—No one within reasonable access should forget the meeting of the Western New York Horticultural Society, which will convene at Rochester on Wednesday January 27th, at 10 o'clock A. M. Rochester is emphatically the "Flower" (Flour) City. She furnishes this society a hospitable welcome and the finest hall imaginable in which to meet, and Western New York has many able and live horticulturists who are always on hand. The programme is a fine one, and all who attend will have a good time.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

JAS. M. THORBURN & Co., 15 John St., New York.—Annual descriptive catalogue (100 pages) of seeds for the vegetable and flower garden; for the lawn, farm and nursery. This firm was established in 1802, and we know of no other firm enjoying a better reputation. The catalogue is a plain unembellished statement of the seeds offered, with simple directions as to their cultivation. The lists of tree and shrub seeds (both deciduous and evergreen), as to numbers and selections, are unequaled. There are many new varieties of seeds offered, among which may be mentioned the Bird Cantaloupe, new beans, sweet corn, peas, potatoes and tomatoes. Chryanthemum seeds saved from the best Chinese and Japanese plants are catalogued among the flower novelties. The list of miscellaneous seeds should be examined. The catalogue will be sent to all who apply to the above firm mentioning the R. N.-Y.

W. ATLEE BURPEE & Co., Philadelphia, Pa.—This is certainly an enterprising firm, and it has sent out many novelties of real merit of late years. The catalogue (128 pages) is profusely illustrated with several colored plates and wood cuts of all sorts of plants as well as of farm animals. Among specialties we find the Pipe-stem or Top-over Corn, Burpee's Empire State Potato, Emerald Gem Muskmelon, Turner Hybrid Tomato, Giant Pera Cucumber, many different kinds of new beans, peas, cabbages, onions and celery; new hardy gladioli, chrysanthemum seeds, new pansies, etc., etc. In the stock department we find Chester White, Berkshire, Small Yorkshire, Jersey Red and Poland China pigs; Langshans, Wyandottes, Plymouth Rock fowls; several breeds of sheep, dogs, etc., etc. The catalogue is well worth examination. Sent free to our readers.

PETER HENDERSON & Co., 35 and 37 Cortlandt Street, N. Y.—A beautiful catalogue of 138 pages, illustrated with hundreds of woodcuts and three colored plates, one of a new asparagus, a new lettuce and a new cucumber; another of the roses Bennett, American Beauty, Ball of Snow and Sunset, and the third of the Eclipse Beet. There are too many specialties to notice here. We need only mention a new "Self-husking" Corn, the "Volga" Watermelon; the Perfect Peachblow, Charter-oak, Empire State and Pearl of Savoy Potatoes; the Mikado Tomato and Tree Tomato of Jamaica, Henderson's new Rose Celery, new Chrysanthemums, new strains of Verbenas, etc. The catalogue must be examined to be appreciated. Send three two-cent stamps, and mention the RURAL.

D. LANDRETH & SONS, Phila., Pa.—An illustrated catalogue of 100 pages. Though not the showiest, it is still one of the best published in America, and by one of the oldest houses. We find in this potato seeds (true seeds from the ball or fruit) offered. We have repeatedly advised our readers to raise their own seedling potatoes. Now is the time to sow them in pots or boxes. The lists of all kinds of vegetable, flower, grain, root and grass seeds are full and carefully selected. The Landreths grow most of their own seeds. Catalogue free to our subscribers.

S. L. ALLEN & Co., 127 and 129 Catherine St., Philadelphia, Pa.—An illustrated catalogue of garden and farm implements made by this firm, among which we find the Planet Jr. Seed Drills of several sizes, the Planet Jr. Combined Seed Drills, Wheel Hoes, Cultivators and Plow, the Planet Jr. Single and Double-hand Wheel Hoes and Cultivators, the Fire-fly Garden Plow; also the Planet Jr. Horse Hoes, Cultivators and Coverers. These are fine implements for the use of the gardener or farmer. We have had them in use on the Rural Grounds and Rural Farms, and find them most useful for every kind of crop cultivation. Send for this catalogue and see what they make.

ANT. ROOZEN & SON, Overveen, Holland.—Deveer & Boomkamp, agents for U. S. and Canada, 19 Broadway, N. Y. An illustrated catalogue of gladioli, dahlias, ranunculuses, anemones, irises, cannas, begonias, gloxinias, amarylis and other Dutch bulbs. There are special collections offered at most reasonable prices. All duties are paid and the prices include packing and all expenses for freight, etc., to New York and Toronto, Canada. The firm is entirely trustworthy. Catalogue free. Address the U. S. agents, as above.

HOTCHKIN CARRIAGE WORKS, Syracuse, N. Y.—An illustrated catalogue of all styles of wagons, carriages, buggies and sleighs made by this firm. It embraces extension-top carriages; side-bar Brewster, Timken, end-spring and side-spring buggies; eliptic, platform, half-platform and three-spring wagons; sleighs, cutters; in short, all things that are wanted that are light and nice. We advise all wanting anything in this line to send for this catalogue and see styles and prices.

WILLIAM HENRY MAULE, 1711 Filbert St., Philadelphia, Pa.—This catalogue is full of remarkable illustrations and stirring announcements, from which it is rather bewildering to attempt to specialize. It would seem that about everything announced is a specialty or novelty better than any other of its class. Mr. Maule has erected and lately occupied one of the handsomest seed warehouses in the country, where he hopes to hear from all his friends. The catalogue will be mailed free to all who apply as above.

HIRAM SIBLEY & Co., Rochester, N. Y.—A carefully condensed and abridged catalogue (70 pages) of every kind of seed for the farm or garden, with a number of valuable tables for the assistance of the farmer or gardener. Among oats it offers the Schoenen, White Australian, Probsteier and Black Tartarian. The list of clovers, grasses and millets is full and well selected. Seeds of hardy shrubs and trees, as well as bulbs and various plants are also catalogued. Sent free to RURAL readers upon application to the above firm.

JACKSON IRON WORKS, No. 315 East 28th Street, N. Y.—This is an illustrated catalogue of every fixture and device that can be thought of for use either in or about a stable or cattle farm or to ornament the outside. It is the most complete list of such fixtures we have ever seen, and should be consulted by everybody who wishes to have things handy. It has also several fine designs for stables and carriage houses. A splendid catalogue.

DUTCH-FRIESIAN HERD BOOK.—We have received from the Secretary, S. Hoxie, Whitestown, N. Y., the fourth and last volume of this herd book, as this society is now merged into the Holstein-Freisian Association, which event is very pleasantly announced in the preface by the secretary. It contains registry of some 300 males and 600 females.

AMERICAN DUROC-JERSEYS.—The first volume of the American Duroc-Jersey Record, containing the constitution and by-laws of the society, the history of the Duroc-Jerseys, and a register of 2,000 head of these swine. Chas. H. Holmes, Sec., Springfield, Ill.

MT. VERNON LINSEED OIL Co., Mt. Vernon, Ohio.—A circular setting forth the value of linseed meal as a food for farm stock. We hope to see the day when every pound of this rich food will be fed at home instead of being exported. Our fields need the manure made therefrom.

ALEXANDER BRADLEY & DUNNING, Syracuse, N. Y.—An illustrated catalogue of tur-

bine water wheels, circular saw-mills, improved head blocks, etc., etc., giving directions for setting, balancing, etc., water wheels and machinery, containing important tables for the practical mill man.

DR. JOS. HAAS, Indianapolis, Ind.—Hogology, or information concerning swine—a little book of some 60 pages, which contains much useful information. Of the value of the remedies recommended, we know nothing personally, so all we can say is, read the book and judge for yourself.

PUCK'S ANNUAL.—A handsome and very funny book of some 100 pages and 200 comic original illustrations. Price 25 cents. Send to the publishers, Keppler & Schwarzmann, New York.

H. S. GILBERT & Co., Chambersburg, Pa.—Catalogue of force and lift pumps, specially designed to show the Gilbert pumps.

A. M. SMITH, St. Catherines, Ont., Canada.—A catalogue of small fruit plants, grape-vines, fruit and ornamental trees, etc. Free.

GEORGE S. JOSSELYN, Fredonia, N. Y.—Catalogue of currants, raspberries, blackberries and grapes. Free.

For Women.

CONDUCTED BY MISS RAY CLARK.

THE BRAMY RUSETER.

"PHILENY," sez Jeremier one mornin' at brekfust as he buttered his flap-jack on both sides and then put on two big spoonfuls of strained honey, "Phileny," ses he, "I believe our poletry is gittin' kinder run out, and I've ben a thinkin' of gittin another ruseter."

"Well, sez I, as I swallered my baked pertater dry, (I am obleged to ekonomize to offset his extravagance) it might be a good idee, pervided you made a good selection of breeds."

"Breeds," ses Jeremier sarcastically, "they don't use that word madam in speakin' of poletry. That word applies only to cattle. I've ben a kinder rmmin' over in my mind the good pints of the different birds I've seen, and I've kinder settled on the Blue Meshannock."

"The Blue Meshannock! why good land, Jeremier, that's the name of a pertater. Father used to raise 'em as long ago as when I was a girl!"

"Taint no seeh thing, Phileny, I guess I know what I'm a talkin' about. I mean them big, glossy, black fellers, with blue legs, we see to the fair last Fall."

"Why them's Black Spanyards. We don't want them. Their meet would be as dark as your boot when 'twas cooked, and pretty nigh as tough. I'm in favor of the Buff Coaches."

It allers riles Jeremier to correct him and he jerked back from the table spiteful, and ses he, "It don't make much difference to us whether the meet is black or white, you are so blamed stingy you won't never cook any."

"That's a falsehood, Jeremier, sez I, and you know it! I allers cook 'em Thanksgiven' and Fourth of July, and your birthdays and lots of other times, and you eat the most on 'em too. Come to think it over, I don't know as we want to change. Ourn is good enough."

"Well madam, sez he, I've made up my mind to change, and I'm a goin' right off today and get one, and it don't make no difference whether its called a Blue Pertater or a Buff Street car, if it only suits me."

"You was in a terrible pucker yesterday to get your oats in, ses I, and here yon are trapesin' off ruseter huntin' this nice mornin."

"Madam, sez he, who's a runnin' this ere plantation, you or me? 'cause if you be you can jest hitch them horses up and go to plowin' yourself. The interests of my poletry yard require me to go in search of a ruseter, and I'm a goin' till I find one if I take the week fur it."

"Go," I replied, a wavin' my hand theatrickly, "go, but there's a big storm a brewin', and when it comes and catches you behind your naybors, don't be a whinin' around 'bout Providence bein' allus against you."

And he went, and he stayed, and he never showed his face agin till arter sun-down, then he come back with sunthin under his arm that looked like half ostrich and half camel, for it had the humpedest back, and the longest neck and legs I ever see outside of a managery.

"There, Phileny," sez he, a settin' of it down on the door step, "I reckon I've got sunthin' now as is sunthin'.

"That's a pure-blooded, double-strained pettigreed, White Bramy, that is. No sham 'bout him; guess old Jones 'll own up beat this time. He allers thinks he has the best of ev'rything in the hen line. This feller shows his blood, he does."

"I should say 'twas a five storied, mansard-roofed grain elevator," sed I. "He'll eat all you can raise on the farm and then swaller the buildin's."

"Yes, that's you egsactly, Phileny, alles grudgin' things what they want to eat, mebby you' better run this institootion awhile. Guess you'd find it took some one with a head on 'em," and he picked up the ruseter and carried him off to the poletry house, and never spoke to me agin that evenin'.

"'Bout the middle of the night I woke up, and good land! The rain was jest a pourin'. Rattlety-bang went the blinds, and loose clapboards, clickety-clack went the doors and winders. I knew Jeremier was awake 'cause he want a snorin'. I knew he wouldn't say nothin' for fear I'd hint at the oats, so I laughed in my night-gown sleeve and was silent as the tome.

When we got up in the mornin' everything and everywhere was flooded over, and still it was pourin'.

"I dunno but we shall have to build an ark," sed Jeremier, tryin' to be unusually pleasant to keep my mind off the neglected plowin'.

"I don't think it will be necessary," sed I dryly, "we can get aboard the Bramy."

The poletry was all astir in spite of the rain and in less than half an hour that Bramy had laid out the two ruseters, picked the tom tmrky blind and bare, drove every hen off to the naybors, and was making a desert off the old gander. Jeremier had to tie him up in the wood-shed with the clothes-line. As we were eatin' brekfast we heard a loud cock-el-doodle-doo on the porch and there he stood with about two yards of rope hangin' to his one foot, he had broke it in two.

"How knowin' he is," said Jeremier.

"He is indeed," said I, "he seems to say here am I and here is the rain, but how about the oats?"

"Would'nt you like to have some churnin' done this mornin'? I can do it aswell as not, Phileny."

"Yes, there's a four gallon crock of cream down suller, you can bring it up if you're a mind to," I replied quickly for he don't often offer to do seeh things.

He brought up the cream, and stepped out on the porch where we allers churn in warm weather, but the floor was wet and slippery. Up went one foot, he spun 'round on the other half a minute tryin' to get his balance, then down he went ker squash. The crock flew out of his hands onto the stone steps and smashed, and the cream—well you can just imagine it. He got up slowly, rubbin' his hip and groanin' and I sez, sez I, "I've heerd tell of rotary churns but I never see one work before. That's about the quickest churnin' I ever see done."

"I'm glad of it," sez Jeremier, "when a man's fool enough to offer to do women's work sunthin' orter happen."

I turned and went into the kitchen, and there was the Bramy on top of my work-table a gobblin' up the bread sponge. I shooed at him and he lifted up one foot and set it down in a bowl of warm pork fat. Lifted the other and put it in a tall glass dish, then he hopped off and strided across the floor' leavin' the print of his foot in grease all the way. The glass dish rolled off into an iron pot and smashed, and the grease bowl tipped over and the contents ran all over the table and off onto the floor. I flirted my dish-cloth at the ruseter and he grabbed it and swallered it quicker'n litenin'.

Well, it rained steady three days and nights. Nothin' a growin', and that ruseter eatin' all the time like a second Jumbo. He found a nest of young ducks a hatchin' and swallered 'em, hide, feathers and shells, eat the bottoms out of two swill-pails, pecked chunks out of the calves' ears, and begun on some old phosphate bags. Then it cleared up, and he went for the currant and gooseberry bushes, and left nothin' but the stubs. In course of time, Jeremier planted his airly pertaters—some new-fangled ones that he paid a big price for. The next mornin' he cum in with a long face. "Them pertaters is up Phileny," sez he. "Up," sez I; "whatever do you mean Jeremier?"

"Up, and down too, I guess, for I belive in my soul that Bramy has eat 'em," he answered.

One day, along come old Jones, and he yelled out, "Say, Stebbins, what's that creetur on stilts out in your gardin' eatin' up your lima bean poles? I thought it must be a giraffe got away from the circus."

Well, we got tired chasing after him, trying to keep him out of mischief, so we shut him up and fed him two quarts of corn and oats three times a day. And we went to work and planted our garding, and got along finely. We are amazin' fond of cabbage, and Jeremier laid off a big patch of ground, and made it rich and fine. Then he was gone a whole day after plants. He found some extra nice ones, and we both worked half a day a setting of 'em out. I watered 'em night and mornin' for two weeks, and they were growing finely. We felt so encouraged, we decided to rest from our labors for a day, and go to the lake with some of the naybors. We went and had a lovely time. As we rode home, we conversed lovingly of our prospects, and spoke particularly of our promising cabbage patch and our young chickens, for we had 30 little yellow things just hatched.

As we drove into the yard, we saw the Bramy a standin' by the coops, and the two hens inside were squawkin' terribly. We ran out there, and, believe it or not, that old cannibal had eat up every last chicken and was a pickin' the feathers of the hens and swallerin' of em'. He had got the door of his pen open somehow, and let himself out. Jeremier caught him and bound him hand and foot, so to speak, and cast him back into his dungeon, and said, "Lay there you old heathen."

I took the sprinkler and went out to the cabbage patch. Could I believe my eyes? Not a green leaf was there. No, nor even a root. I called Jeremier, and he looked and he said, "that blamed ruseter." We went down to the garding. There was nothing there but the ground and the bean-poles. I looked at Jeremier agin' and he said, sez he, "that old glutton of a Bramy." Nothin' more; not a word. If there had been any chance of layin' of it onto me he'd have talked 40 nots to the honr. But I s'pose he's like all men about that. By good luck a chicken peddler stopped the next mornin' and wanted to know if we had any airly chickens. "Yes," said Jeremier, and took him out and showed him the ruester.

"Do you call that an airly chicken?" said the man.

"Yes," sez Jeremier, "early and late, both. Come, make me an offer."

The man hefted him, said he would make a good frame to a sailin' boat, turned bottom side up, and offered forty cents. "*Forty cents!*" cried Jeremier. "Why, man alive! he cost me three dollars."

"Can't help that," said the man. "He's so old his teeth are all gone. He'll be tniffer n' tripe. I shall hev to sell him to some boardin' house keeper at half price."

"Is that the very best you'll do?" said Jeremier, sadly..

"That's the very best I can do, and I don't want him at no price," replied he.

"Take him, he's yourn," says Jeremier. So they put the ruseter in the coop and let his head stick out through the slats on top, and the man drove off, and we shed not a tear.

"Phileny," sez Jeremier, sez he, "I'll get you a nice dress if you'll never, so long as we two live together, alood, by word, look, or act, to that blamed ruseter."

I promise, Jeremier," sez I, "and here's my hand on't."

And I never have.

PHILENY STEBBINS.

LEAVE THE WORK.

MAY MAPLE.

"DON'T take work when you go for an afternoon visit," said a friend, not long ago. And the suggestion was a good one.

Sure enough! Why should farmers' wives and daughters pin themselves to work, from early morn till late at night, at home and abroad? Why not make a friendly visit now and then and allow the tired hands and more weary feet to rest from their labors, and give the mind something fresh to muse upon by allowing the eyes to wander through fresh scenes, to look upon, possibly, fairer flowers and new prospects? Our village sisters think nothing of spending a part of every day in what appears to us perfect idleness. They have not performed half of the alloted tasks of those of us who live in the rural districts. Yet you will frequently find them resting from the duties they have performed and believe they have earned that rest. Are they possessed of real estate or bank stock? No! There are but few of them who can lay claim to the roof that covers them. They are for the most part dependent on their husbands for their support, and not unfrequently they purchase bread, pies and cake to save themselves the labor of making them. They toil not beyond a mere health-giving exercise, and when they go for a visit, be it for a whole day, no work disturbs the repose of their dainty fingers. They rest.

We may not approve of so much, to us, wasted time; but for the most part farmers' wives go to the other extreme and deem it a sin if a single moment is passed in idleness. Farmers, themselves, have their restful visits. You can see them sitting on the fence, hours at a time, talking over farm topics, politics, gossipping and cracking jokes, with great gusto. When the fence gets tired, they slip down and take a stroll about the farm, learning of each one something for pleasure or profit. They do not carry their work with them; but when the other side of the household sets out for a gossipping visit there must always be a bundle of work taken, and not unusually, a bundle of humanity to tote or cart as well; and yet the great cry is for rest. What hinders? Custom, fashion, Mrs. Grundy—call it what you please. The fact is, we are all willing to make slaves of ourselves; and the more machinery we have the more we task ourselves. Custom says we must cook so many vegetables, various cakes, cookies, pies and puddings; put up a great variety of canned fruits, preserves and pickles. We all faithfully follow her command. She says, "Clean house much or little three hundred and sixty-five times in the year." We yield willing obedience. Fashion orders us to dress in purple and fine linen every day, and silks, satins and velvets every other day—Sundays in particular—with the adjuncts of costly jewelry and expensive frizzes. Our purses are limited; the bottoms are easily reached. but to show our willing spirits we add to our already heavy burdens by raising chickens, ducks and turkeys for market. We pursuade the head of the family to go into the dairy business, well knowing that the work of taking care of the milk and butter will add so much more to our household duties. Then Mrs. Grundy exhibits fabulous gowns that are covered with trimmings, and what the machine cannot do the hands must. What wonder, then, that there is never a minute to spare, to chat with a neighbor, without doing some work! Our great grandmothers taught that Satan always finds something for idle hands to do. But there is a vast difference between the idleness to which our grandmothers referred and that of my friend. Therefore, we reiterate her sentiments, and say leave the work at home when you make an afternoon visit.

Domestic Economy

KITCHEN TALKS.

ANNIE L. JACK.

"THEY might allow something to good management," I said to the girls the other day in a "kitchen talk." Our conversation was of a remark passed by a neighbor, who said to me, "Your boys help you a great deal, and your girls work hard to keep such a house in order, yet you always seem to have time to spare for your chosen pursuits. It must be that the boys help the girls a great deal." I did not object to the boys having the credit, for I have taught them that it is more honorable to help than to louf round and see their sisters doing everything for them, and that it is only an exchange of work if they light fires, or sweep the kitchen, to give their sisters time to darn socks and mend torn jackets. It is a good education for them to sew on their own buttons and peel the potatoes in an emergency. But in the matter of housekeeping management, I think too little stress is laid upon *routine*. "Oh, I can't do my housework by the clock!" is an expression often used by irregular people in talking on this subject. But it is just as easy to take work in rotation and to keep to the routine as to leave the lamps till night to be trimmed, and the up-stairs work the same. Children take readily to

Miscellaneous Advertising.

Medical men are much interested in discovering the various sources of disease as, whether from foul air, impure water, infected food, and possibly soap made of fat from diseased cattle.

Hence I subjected various samples of "IVORY" Soap to a rigid microscopical examination.

I find it to be free from any forms of animalcular or vegetable germ life.

I therefore cordially commend the Ivory Soap for its unsurpassed detergent properties and purity.

Yours respectfully,

R. OGDEN DOREMUS, M.D., LL.D.

Prof. Chemistry and Toxicology, in Bellevue Hospital Medica' College, and Prof. Chemistry and Physics in College of the City of New York.

Free of charge. A full size cake of Ivory Soap will be sent to any one who can not get it of their grocer, if six two-cent stamps, to pay postage, are sent to Procter & Gamble, Cincinnati. Please mention this paper.

clockwork; the round of the hands interests them, and, while learning lessons of regularity, they enjoy seeing how the time goes. If they know their duties must be performed at a certain time, they will, more than likely, watch and perform them, and a few chidings for neglect or forgetfulness will soon cause them to be on the alert and ready. I do not think it a merit for any housekeeper to be always among the kitchen work, forever cooking and cleaning up. Sufficient for the day is the work thereof, and some time must be given for recreation, or else lines of care will form on the brow, once so smooth, and there will be weariness of body and mind for lack of change. I know it is hard for mothers whose hands are full and whose babies are cross to keep to regular rules; but even in this case it is best to make the attempt. "Learn young, learn fair," is a very good motto, and though there is a difference in the nature of children in regard to order and neatness, a great deal can be taught by steady precept and example. But, bless me! it is nearly dinner time, and I I have spent the morning all in theorizing.

HOW TO MAKE THE MOST OF ONE CHICKEN.

THE following I think a novel way of useing a fowl and making much of it, and likewise rather original. First select a yellow-skinned fowl weighing about four pounds; after a good singeing wash well in cold water, and put over in a kettle with plenty of water; let it boil; throw away this water as it removes any taste of feathers; then return to the fire and cover with cold water and boil slowly until tender. Season well with salt and pepper. Next, take up and joint and pick out all the best meat, both dark and light, and cut in pieces one or two inches square (or long), cut the liver and heart also in pieces the size of dice, mix well with dark and light meat, and place in a deep stone or earthen dish and pour from the kettle enough of the top of the broth to completely cover the meat. Set away for future use.

Return all that remains, bones, skin and all, to the remainder of the broth, and boil until the bones are perfectly clean. Now strain through a colander, and pick out the bones; next chop all you have, skin, gizzard and meat very fine—the finer the better. If onion is not distasteful, slice one small one and add two or three cloves, and boil in the broth a few minutes: then skim out and add the chopped chicken, and boil only a few minutes. It is ready to use, either with a little thickening poured over thick slices of toasted bread, or as a soup which cannot be excelled. A pound of bread cut very thin and toasted a nice brown to crumb, is nice in place of vegetables or cracker. This amount will serve six hearty persons. Now for the choice bits:—Say, the third day after, the soup (in cool weather), make pies or turnovers. Warm the chicken and drain through a colander, leaving the broth in the kettle for gravy. Next take three pints of unsifted flour (about two pounds). Sift twice or thrice through a fine sieve with your baking powder (I use Horsford's and believe it the best); add salt and three tablespoonfuls of pulverized sugar. Wet with sweet milk: make a dough just stiff enough to handle. Roll the dough thin and spread over it one-fourth pound shortening—butter is best and and should be soft—then sprinkle with flour and roll up. Cut up in pieces as for biscuit, roll about one-half an inch thick, and you will have a circle the size of a saucer. Wet the edge half way around, lay on pieces of chicken to cover half the size, turn over the empty half and pinch the edges firmly together. Butter a dripping pan, lay on the turnovers so that the seam will be at the top, and be careful to lay them sufficiently apart to give each room to rise, for rise they will if they are good. With a sharp-pointed knife make a small hole in the top of each, and partly insert a piece of butter. Bake in a hot oven as long as large biscuit. Serve *very hot*, with plenty of chicken gravy, which is made with a small piece of butter and flour added to the broth.

Now what have these two dinners cost? With mashed potatoes, not over 90 cents, all told. And very likely a very good breakfast or small dinner yet remains. The cold turnovers cut in rounds one inch thick and steamed are very nice.

I have also used veal in the same manner, and it does well, at about half the price of chicken. SUBSCRIBER.

Conn. Valley.

HOME-MADE WEATHER STRIPS.

MY kitchen doors had become so badly warped that they did not hit the jamb at the top. The following home-made device proved effectual in keeping out the cold. I took a half-inch basswood board and ripped out pieces five-eights of an inch in width and planed them to three-eights by one-half inch. These strips were cut to fit the doors. Take the leg of an old rubber boot, cut strips five-eights of an inch wide, beginning at the top and cutting around the leg. The seam at the back of the leg should be trimmed off with the shears. Tack the rubber, felt side next the wood, to the three-eighths-side of the strip, with the edges projecting. Then lay the strip, rubber-side down, upon the bench and trim off the edges with the small blade of a pocket-knife. Shut the door before nailing the pieces to the jamb. Use lath nails. If you have not a rip-saw, strips may be cut by nailing a straight-edged board to the half-inch basswood strip and then cutting out the pieces with a sharp knife. Smaller strips can be used and put on with brads. I beveled the edges of the strip opposite to the rubber with a smooth plane. SUBSCRIBER.

A FEW THINGS WORTH KNOWING.

Two or three months ago, I read the advertisement of a "Lamp Stove," and as I needed such an article, I sent for one, and it is indeed worth having. It holds one quart of oil, and will burn about 10 hours. All through the cold days of Fall, and indeed up to within three weeks, it kept my sewing-room very comfortable, there being no other way of heating it; it also warms the bath-room sufficiently for bathing purposes, and on very cold nights, I shall leave it in there to prevent the freezing of the pipes. In case of sickness, it would be a great convenience, saving many steps, as it will boil a quart of water in five minutes, and gives a powerful light as well as heat. It is only $1.50.

Here is a recipe for a liniment for rheumatism and neuralgia, which was sent me by a friend last Fall, and I can only say it acted like a charm, relieving me of much acute agony. I have given it to others, and they, too, say it is excellent.

LINIMENT RECIPE.

Spirits of wine, one quart; laudanum, two ounces; oil of amber, one ounce; oil of pennyroyal, one ounce; spirits of hartshorn, one ounce. Mix, and shake well before using. Keep in a dark place tightly corked.

If one has a black silk or cashmere dress to clean, she will find that sponging it with cold coffee and ammonia will do the cleaning well; it will also clean black coats, pants, etc.

For nice colored woolen dress goods which are to be washed, use soap bark. Pour boiling water over it (about two quarts to a cupful), let it soak over-night; pour off the clean liquid into your tub, add hot water, put in your goods, and keep them in quick motion for about 10 or 15 minutes, squeeze them from the suds into clear, hot water, rinse them well in this, and hang up to dry without wringing. Iron carefully on the wrong side as soon as dry enough. AUNT EM.

DOMESTIC RECIPES.

VARIOUS WAYS FOR COOKING LIVER.

CUT in slices half an inch thick, put into a dish and pour on boiling water; let it stand a few minutes, then drain and roll the pieces in flour and put in the spider, which should contain a few spoonfuls of hot meat drippings or melted butter. Fry till a nice brown over a brisk fire, turning frequently to prevent burning. When cooked, add salt and pepper to taste.

Beef liver is improved by scattering crumbs of butter over the slices after taking it from the spider; when this is done, the platter should be set in the oven or heater, till the butter is melted.

When liver has been frozen and then thawed I find it very difficult to cut into nice slices. To remedy the difficulty, I put the lobes into a kettle of boiling water and let it cook about 20 minutes, then it can be cut and fried as above. Or when cold it may be chopped fine and seasoned with pepper, salt and a sprinkling of sage; pack into sacks, scald in the pot liquor and hang up to drain. To be cut off in thin slices and eaten cold. Many "old folks at home" like it best this last way, as it reminds them of their old pioneer days when "liver-wust" was considered a great treat.

MAY MAPLE.

SOFT GRAHAM BREAD.

Two cups of buttermilk, two teaspoonfuls of soda, one teaspoonful of salt, one tablespoonful of molasses; stir as thick with Graham flour as can be stirred with a spoon. Butter hot pans and bake at once.

TO PREVENT INFANTS' SORE MOUTHS.

Wash the mouth thoroughly every morning for a month with cold water. This rule, faithfully followed, will prove a sure preventive of babies' sore mouths. MRS. S. B. E.

"GEM" SQUASH FRITTERS.

Pare and grate three squashes, beat two eggs very light, add one cup of sweet milk, two cups of flour, two teaspoonfuls of baking powder (in the flour), a little salt and pepper. Fry in butter and lard on a griddle.

Vitality and Color

Are restored to weak and gray hair, by the use of Ayer's Hair Vigor. Through its cleansing and healing properties, this preparation prevents the accumulation of Dandruff, and cures all scalp diseases.

When I commenced using Ayer's Hair Vigor my hair was weak, thin, and gray. My scalp was also full of dandruff, and itched incessantly. Two bottles of the Vigor removed the dandruff, stopped the irritation, restored my hair to its original color, and so stimulated its growth that I now have an abundance of long black hair. The occasional use of this remedy keeps my hair and scalp in perfect condition.—Florence J. Cannon, 759 Clinton st., Trenton, N. J.

Ayer's Hair Vigor

is, in every respect, the most cleanly of all preparations for toilet use.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists and Perfumers.

News of the Week.

HOME NEWS.

SATURDAY, Jan. 16, 1886.

THE Chicagoans will have their monument to Gen. Grant erected on Lincoln Park. The committee on designs are now at work, and have arches, statues, towers and terraces to select from.....Last week there were 36 deaths from small-pox in Montreal—a large increase over the number the previous week. A part of the town has been flooded during the week, entailing widespread loss and suffering. The water froze as it rose, while the mercury was from 20 to 28 degrees below zero. Horses and cattle froze to death in their stables. All the factories on the canal and low-lying parts of the city were forced to stop. The loss by the stoppage is estimated at $500,000 a day. Terrible suffering among the poor, "whose houses are often masses of ice."..... The four Newark (N. J.) children who were bitten by "what was supposed to be a mad dog," and were treated in Paris by Pasteur, are home again "cured." It is not yet known for certain that the dog was mad. Two other children who were bitten by the same animal and stayed at home, are still in excellent health, and as hydrophobia does not sometimes develop for several years, there can yet be no certainty that the visitors to Paris are "cured."..... The Canadian Pacific Railway's claim against the Government for transportation services in the recent rebellion is $700,000.....Senator Ingalls, of Kansas, has offered a resolution for the continued coinage of silver till the aggregate reaches $500,000,000. The Silver Question is getting to be sectional in its nature, the West and South generally in favor of unlimited coinage, the East generally against it. The creditor class (the capitalists) seek to contract or prevent any large expansion of the currency; the debtor class and the non-wealthy generally favor the expansion of the currency, or "cheap" money.....M. De Lesseps, having failed to raise more money by subscription to build the Panama Canal, or to induce the French Government to permit a national lottery for the purpose, the French Government has decided to send out an "expert" engineer to examine the work already done and that still undone, and M. De Lesseps is about to invite experts from Germany, England and the United States to join in the investigation. If the results are favorable, the French Government will lend enough money to complete the work; if not, the enterprise will be permitted to collapse. De Lesseps professes to be quite sanguine of steaming through the finished canal in 1888. American "experts" say the thing is sure to be a colossal failure..... The directors of the New Orleans exhibition have been for some weeks denying that they were financially embarrassed, but the worst is now public property, a resolution having been introduced in the city council authorizing the purchase of the property for $125,000. The city already owns the ground on which the buildings stand. The managers say that they will surrender the property of the exhibition for the amount indicated, and if the city refuses to accept the offer the enterprise will have to be abandoned. Over nine months ago we prophesied that the enterprise must eventually prove a failure.....It is said that the Indians in the Canadian Northwest are preparing for an outbreak in the Spring to avenge he death of Riel. The traders on our side of the line are reported to be supplying them with large quantities of ammunition.... ...There is another colored exodus reported from the Carolinas, Alabama, and south Atlantic States. The destination of the negroes ranges from Georgia to California. The migrations of former years, which threatened to be serious, were in the main failures, and this may also prove so. At present, however, it has quite a serious aspect for those in need of farm labor in the south Atlantic States.... ....It is expected that Henry Villard will soon once more become the leader of the Northern Pacific forces. His health is much improved, and the other day, after the settlement of his accounts with the Oregon Railway and Navigation Company, the trustees paid all his indebtedness and deeded to his wife the palace he was building in this city at the time of his collapse, and which they had completed, together with other property, which she at once transferred to another for $168,750..... James Keene, the whilom "cornerer" of grain and gigantic speculator generally, swore in court here the other day that he was now without means, and supported by his wife's fortune, which she received from him 10 years ago. He says he no longer speculates; but with regard to this there are a great many "doubting Thomases."..... The Edmunds anti-Mormon bill passed the Senate the other day with only seven votes against it. It is now before the House, with a strong probability that it will pass without any alteration or trouble. If it becomes a law the property of the Church goes into the hands of 14 trustees, and the corporation will be compelled to show all its books and accounts. No money is to be allowed for "missionary" purposes, and it is hard to see how Mormonism can continue to exist under its stringent provisions. Polygamy is the only feature warred against.....President Cleveland and General Sheridan emphatically deny that General Crook has been removed in compliance with the clamor from Arizona. He is to have all the troops he wants to exterminate Geronimo's band and restore quiet. The bad Indians originally numbered 42 warriors and 94 women and children, and their wanderings have covered 80,000 square miles, 50,000 of them in Mexico. Six weeks ago 11 "bucks" had been killed and 34 women captured. Only 10 warriors were north of the line. The settling up of the country has greatly increased the number of victims. Sheridan says Crook is doing all that can be done, as the country is so mountainous and rough as to afford inaccessible refuges to the "hostiles".....A "large and substantial" ice-bridge at Niagara.....John Sherman elected U. S. Senator by the Ohio Senate and House, Wednesday. It required 74 votes to elect. Sherman received 84, and Allen C. Thurman 62.....The Grant Monument Fund has reached a grand total of $114,116..... ....."Death from exposure" was the verdict recently rendered by a Helena (M. T.) jury on the body of a horse thief who had been hanged by vigilantes.....The mild weather preceding the opening of the year was very conducive to the health and strength of game birds, which are unusually abundant, at least throughout New England.....

Those who have used the Boss ZINC and LEATHER COLLAR PADS and ANKLE BOOTS say they are the best and cheapest, because most durable. They will last a life time. Sold by Harness makers on 60 days' trial. DEXTER CURTIS, Madison, Wis.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, Jan. 16, 1886.

LAND Commissioner Sparks last Thursday, rendered a decision on the claim of the Northern Pacific Railroad to a grant of land between a point on the Columbia River near Portland, Oregon, and Tacoma on Puget Sound, Washington Territory. He holds that no such grant was made to the company. The decision affects the odd number of sections of land 80 miles in width for a distance of 105 miles, aggregating some 2,500,000 acres, estimated to be worth $25,000,000. The claim of the railroad to these lands has long been disputed by settlers, large numbers of whom are in occupation, claiming the right to enter under the public laws. It must be said for Sparks that he is as resolutely opposed to illegal land grabbing by corporations, syndicates, and cattle kings, as to what he considers illegal appropriation of the public domain by bogus settlers under the Homestead and Preëmption Laws. .....A private bill has been introduced in the Belgian Chamber of Deputies providing for an increase in duties imposed upon cattle imported into Belgium. The Government has notified the Chamber that it will oppose the measure.....The Chief of the Bureau of Statistics reports that the total values of the exports of breadstuffs from the United States during the month of December, 1885, and for the six and twelve months ending December 31, 1885, as compared with similar exports during the corresponding periods of the preceding year, were as follows: December, 1885, $10,117,242; 1884, $14,361,542; six months ending December 31, 1885, $52,908,732; 1884, $79,700,507; twelve months ending December 31,1885,$129,757,260; 1884, $147,81,3403.....The President of the California Fruit-growers' Union believes that with the earlier seasons on the Pacific Coast and the quality of native fruit, California may expect a growing market for its fruit in the Eastern States. The grape-growers of California will be content with two cents per pound for grapes, and if it were not for the grasping middle-men in New York, California fruit could be sold at five cents per pound—which is what our Eastern grapes bring..... The New York Fanciers' Club will hold its fourth annual exhibition of poultry, pigeons, pets and non-sporting dogs, at Madison Square Garden, in New York City, during the week commencing February 3d. There will also be on exhibition a full line of incubators, brooders, coops, etc. A large number of entries have already been made, and the liveliest and largest show ever held is expected. Entries close January 2d. Charles R. Hoskins, Secretary, 62 Cortland St., N. Y.....Genuine hog cholera has been found in 1,595 hogs on the four Western counties of Massachusetts. The Cattle Commissioners attribute it to the use of infected Western pork the refuse of which, from city boarding-houses and hotels, was fed to swine.

For Coughs and Throat Disorders use BROWN'S BRONCHIAL TROCHES. "Have never changed my mind respecting them, except I think better of that which I began thinking well of." *Rev. Henry Ward Beecher.* Sold only in boxes.—*Adv.*

Crops & Markets.

SATURDAY, Jan. 16, 1886.

The English wheat market shows no sign of hardening. There have been a few more purchases of American grain there within the week, owing to the decline in quotations here, and an inference has been made that with a further decline on this side we could dispose of still more of our surplus. Certain it is that the United Kingdom continues independent of the United States as yet, so far as her breadsupplies are concerned. Nearly all her supplies are now drawn from Russia, India, Australia and New Zealand, with smaller quantities from Egypt and Chili.

The price of wheat in the United States has fallen. This is due in a great part to a fuller comprehension of the enormous supplies in sight at the leading markets on both sides of the Atlantic. The slight gain in exports, due to the decline, did not serve to stiffen prices, as quotations in England fell, apparently through fear that America was about to unload its surplus wheat at figures to meet the British market. The decreased deliveries at Western primary markets on account of snow and storm, and the decline of about 700,000 bushels in the weekly visible supply, failed to sustain the market. There is an expectation that prices will rally somewhat, but no one expects them to go as high as they were a short time ago.

During the week wheat has been falling rapidly at Minneapolis—the regulator of prices for the great Northwest—so that figures have been lower than for a long time. No. 1 Hard sold yesterday afternoon at 85½ cents, a fall of four cents during the week and mostly in the last few days. This was partly due to a speculative movement; but, back of this, there is a panicky feeling about future wheat. There is less confidence in permanent high prices for wheat than there has been since the crop was harvested. This distrust is due to the obstinancy with which the "visible supply" remains at a high figure and the persistent refusal of foreign countries to take our surplus wheat at our present figures. Country deliveries, owing to stormy weather, have been very light receipts at Minneapolis during the week, only 477,000 bushels. The mills are maintaining the rate of production which they have followed, the output for the week being 84,000 barrels. Shipments were 60,000 barrels. There is a prospect of larger production next week, though there is no prospect of greater activity in flour. The Pioneer Press estimates on inquiries addressed to elevator and warehouse men in the Northwest, that there were marketed in Minnesota and Dakota during 1884, in round numbers, 47,000,000 bushels of wheat. It puts the amount now in store in country elevators at 9,385,000 bushels, and concludes that there is not more than 6,000,000 bushels in farmers' hands. This would leave the total yet to be received at the primary markets about 15,000,000 bushels.

At Philadelphia, wheat has ruled dull and unsettled with a general decline in prices in sympathy with the break in other markets. Futures are 1½ cent lower, while cash and January are only three-fourths cent lower than at the close of last week. Flour has shared the dullness in wheat, but has been steadily held at unchanged prices; in fact, millers in some cases have ordered stocks held for higher rates. Corn has declined 1¼ cent. Stocks are light, and there is a good inquiry to complete old contracts for export. At St. Louis breadstuffs receipts and shipments are unusually light. Wheat has been badly depressed and is unsettled. Other grains are weak with light transactions. Flour is very dull and unchanged. At Milwaukee, wheat is unsettled and lower, but closed steadier. The increase on passage to Europe and the light demand there, demoralized values, May selling down to 84¼ cents, but rallying sharply to 85⅞ cents under liberal purchases from short dealers and a reported increase in export demand East. Receipts are light since the cold weather, averaging less than 10,000 bushels daily. Shipments are light, and the demand from millers is moderate. The flour market is dull but firmer. At close there was some export demand.

Late advices from the Pacific Coast report that there were on January 1, 1886, about 10,000,000 bushels of wheat there available for export.

Reports to the American Rural Home, of Rochester, N. Y., from over 5,000 correspondents in all parts of the country, indicate that the snow-storm, despite the recent intense cold, has protected the wheat from all harm. In 1885 the corn crop turned out inferior to that of 1884. There is general complaint throughout the Northwest of light, chaffy, dry and moldy corn. The wheat consumption in the future can be increased only by the ability to sell it at what are called "starvation" prices, because of the foreign competition. In general, the correspondents say that there is nothing warranting high prices in 1886 except the total failure of the crop now in the ground.

The last report of the Department of Agriculture puts the corn crop at nearly 2,000,000,000 bushels—the largest ever raised; but as we have frequently said of late, in this Department, a multitude of reports from the West go to throw doubt on this estimate.

Indian corn continued moderately steady during the greater portion of the week, but was finally overcome by the downward career of wheat, and prices went off in spite of the decline in the visible supply of over 1,000,000 bushels within the week. Indian corn is the only cereal in the export of which there has been any material increase. This is due to its low price here and the absence of competition in the foreign markets.

Oats followed Indian corn quite closely in the speculative market, opening firm and sustaining a moderate advance when the decline of about 700,000 bushels was announced in the visible supply. Later, however, it reacted and became dull and heavy at fractionally lower figures. It is a trifle strange that in the face of the largest crop ever grown here, the price of oats should remain so high. It went up steadily until three weeks ago, and has suffered very little decline since then.

Wheat flour has been lower and in less demand than previously. Prices are off some five to 12 cents per barrel. Inquiry is quite limited, and exports from this port still remain low. With an advance in flour, wheat, too, would step higher. But at present prices for flour, millers can't afford to advance prices of wheat to any considerable extent.

The Australian harvest is over. Ninety thousand tons of wheat will be available for export, say 30,000,000 bushels.

The hog products speculative markets advanced rather beyond expectations during the early portion of the week. This was variously explained, in the absence of any marked increase in export purchases, as due to speculative buying of lard in view of anticipated buying in the near future by foreigners, where stocks are said to be relatively light.

At Philadelphia there has been little doing in hog products except in small lots to fill jobbing orders. Prices show no important change. Butter of fancy quality is scarce and wanted, but undergrade goods are plentiful and dull. Eggs advanced 7c. per dozen on speculative holding, influenced by the cold weather and snow blockades, but 3 to 4c. of this advance have since been lost, and the market closes dull and unsettled. Fruits and vegetables are generally dull, owing to unfavorable weather conditions, but prices are steady. Provisions at St. Louis are in limited sale, with buyers and sellers apart. The hog market has been oversupplied by the arrival of delayed trains, while hogs are weak at small declines. At Dubuque (Iowa) provisions generally are without change in prices. Pork is looking up a little. Produce receipts are liberal. Railroads are shipping considerable pork from Davenport (Iowa) south, and lard to Baltimore and to New York, this movement being earlier in the season than usual. The Milwaukee hog movement is light, and the quality falling off. The market is dropping. Products are dull.

The total exports of cattle, hogs, beef, pork, and dairy products from the United States during the two calendar years last past, as reported by the Bureau of Statistics, were as follows:

	1885.	1884.
Cattle, number	135,732	133,106
Hogs, number	62,572	33,217
Beef, canned	3,974,640	3,290,350
Beef, fresh, pounds	109,070,477	117,108,801
Beef, other, pounds	76,514,856	87,461,749
Tallow, pounds	43,540,175	52,960,282
Bacon, pounds	367,654,320	308,657,564
Ham, pounds	54,188,086	45,171,738
Pork, pounds	77,716,472	51,478,322
Lard, pounds	205,492,178	228,853,516
Butter, pounds	19,327,811	21,303,492
Cheese, pounds	90,346,235	109,219,991
Totals (values)	$93,713,028	$96,449,142

A telegram from Jacksonville, Fla., says: "Despatches from all parts of the State confirm the belief that the cold wave carried frost to almost the extreme southern end of the peninsula, and there is little doubt that substantially the entire orange crop remaining on the trees is frozen and spoiled. The precise effect upon the orange trees cannot be determined until the warm weather sets in. Probably every tree in the State will lose it leaves, and the belief of the best observers is that most of the young trees are killed. It is estimated that 500,000 boxes of oranges, worth $1,000,000, were destroyed by the freeze."

Norfolk spinach, per bbl., at $1@$1 50.

LIVE STOCK MARKET.

NEW YORK, SATURDAY, January 16, 1885.

BEEVES—Total receipts for the week 10,389 head against 8,853 for the same time last week. The cattle market is generally duller about this season owing to the immense quantities of poultry shipped in from all quarters. Considerable poor stock is offered, mostly large bony steers and inferior cows. First-class grade steers of good shape and condition are in fine demand and fair prices, the choicest reaching $6@$6.10 per 100 pounds. Stock of good shape, with heavy hind quarters and thick flank will be sold to better advantage than larger animals with the meat development on the fore quarter and nerk. Whenever the beef market becomes dull, the poorer grades suffer most. Butchers are always ready to buy prime animals at good prices. Prices generally range from $4.25 to $5.40 for common to good steers, with a few choice lots above $6 and some inferior cows and bulls as low as $3. One bunch of corn fed Colorado steers averaging 1,301 pounds sold at $5.15, while another bunch of ordinary grass-fed cattle averaging only 130 pounds less, brought only $4.75½. Best Pennsylvania stable-fed steers averaging 1,450 pounds brought $6, while a poorer lot averaging 1,295 brought but $5. Short-horn grade steers from Ohio, in fine condition, averaging 1,820 lbs., brought $5.10, and found easy sale. The highest price paid for cows was $3.60 for a small bunch averaging 1,118 pounds. Most cows and bulls sold below $3.25.

CALVES—Grassers, 300 ℔, at 3c.; 350 ℔, at 3½c. Fed calves, 462 ℔, 4½c; yearlings, 606 ℔, at 2⅝c; two-year-old, 813 ℔, at 2½c.

SHEEP AND LAMBS.—Indiana lambs, 83 ℔, 6c; Indiana sheep, 96 ℔, at 5c; Kentucky do., 125 ℔, at $5 10; Ohio lambs, 73 ℔, at 6¾c, State sheep, 81 ℔, at 4½c; Michigan do, 82 ℔, at 4½c; Canada lambs, 87 ℔, at 7c.

HOGS. Receipts for six days 47,670 head against 38,816 head last week. Ohio hogs, 159 ℔ average, at 91 35 per 100 ℔.

LINSEED MEAL.

ABSOLUTELY THE BEST FEED FOR

CATTLE, HORSES, **CALVES,** SHEEP AND HOGS.

This Meal is the product of pure sound Flaxseed, Linseed being its other name, and is the most nutritious of all feed, because it contains the largest proportion of nitrogenous substance.

It is almost needless to say that, in order to derive much benefit from the use of Linseed Meal, it must be fed in quantity. At least one-half of all an animal consumes may safely and profitably be LINSEED MEAL.

☞Please send in a sample order or for circular and prices. Orders will be promptly filled by any one of the following parties:

Cleveland Linseed Oil Co., Cleveland, Ohio.
Toledo Linseed Oil Co., Toledo, Ohio.
Detroit Linseed Oil Co., Detroit, Michigan.

THE RURAL NEW-YORKER

The great national standard of Rural Journalism. It is the accepted medium for the introduction of all New Plants, Seeds, and farm implements. These are tested regardless of cost at the Rural's Experiment Grounds of 300 acres. Its Free Seed and Plant Distributions have popularized many of the most valuable varieties in cultivation. It is original from beginning to end. It employs the best writers in the world. It is the first journal to have established Experiment Grounds; the first to present careful and original illustrations of plants of all kinds, of cattle, farm and garden helps, poultry, large and small fruits, grapes, and everything appertaining to rural life. Over 500 engravings yearly. Over 600 writers. It is edited by practical farmers. It combines the best features of the daily and weekly press with all that can instruct, elevate and interest the rural home. It costs more to publish than any other weekly in America. It is for the North, South, East, West. The ablest farm and garden weekly in the land. It is pure, trustworthy, sparkling, alive, independent, and faithful. It exposes all frauds. It answers over 5,000 questions in its Farmers' Club. Free specimen copies will give a full account of its present Free Seed Distribution, and of the sterling presents offered for clubs. We want you to KNOW that the Rural New-Yorker is the best journal of its class published. It will help you to make money and to spend it judiciously. Fine paper, 16 pages, $2.00 a year. Subscribe now. Address the Rural New-Yorker, 34 Park Row, N. Y.

For the Young.

THE SNOW STORM.

DULL lay the earth and barren
In the December cold,
Scarred was its face and broken,
Weary and dim and old.
Over the rustling forest
Slow sank the sun from sight,
Out crawled the blind old shadows,
Led by the fiends of night.
Over the gloomy graveyard,
Where the rude mounds appear,
Crept the dark shadows, driving
Backward the light in fear.
Sad as an old man dying,
Nothing could comfort bring
Save the warm breath of Summer
Or the low laugh of Spring.

But through the night the snowflakes
Tenderly found their way,
Laying a spotless mantle
Over the earth so gray.
Weak, for a child's breath killed them,
Blown in its careless mirth;
Strong, for they took the sorrow
Out of the face of earth.
Silently, softly falling,
Soft as an angel's plume,
Hiding the dismal horror,
Hiding the staring tomb;
Over the dreary churchyard
Throwing a mantle warm,
Where the tired hearts lay sleeping
After life's weary storm.
Hiding the marks of sorrow
Under its spotless white,
Brightening all the future,
Filling the world with light.

So when we doubt and wonder,
Dropping our burden down,
Weary at Fate's hard questions,
Weary at Fortune's frown,
When at the soul's dimmed windows
Beckon the ghostly fears,
Pointing to hopes all broken,
Hid in the graves of years;
Then from the mighty record,
Such as the angel's know,
All of our good deeds flutter
Soft as the falling snow;
All of the kind words spoken,
Smiles, and the friendly hand,
All of our self-denials
Hasten at God's command.
Hiding the years all broken,
Drifting at Trouble's door,
Teaching a deeper patience
Than we could know before.

UNCLE MARK.

UNCLE MARK has had his snow storm at last. It came hard enough when it once started. The papers tell us that it started down in Texas, and came sweeping up over the country, and was lost at last out on the ocean. Most of our great storms start in the West and travel towards the sea. Text books tell us that wind is "air in motion." Most of us found that to be very true last week. You all know that hot air will rise. Suppose a great mass of air, covering miles of ground, to become heated. Up it goes, and the colder air all about it rushes in to fill the vacant place. Then this mass goes tearing and twisting about, growing stronger and stronger as it goes, doing all the damage it can till it slips off into the ocean and wastes itself. This last storm did a great deal of damage. Trains were delayed, vessels were wrecked, and people were frozen to death in some States. I hope the Cousins were all safe and warm, where the wind could not find them.

A snow storm always makes lively work. In the country, we have to see that everything is under shelter, for if the snow once covers tools up, they will not be seen again till Spring. After the storm is over, we have to dig out the paths. I used to have to do that when I was a boy. I remember one great drift so high that we cut a tunnel through it. One day, during a snow-ball battle, some of the boys tried to use it for a fort. They went inside to make snow-balls, and the rest of us broke in the top and buried them up. It generally pays when snow-balls are flying about, to keep out in the open field where we can see what is going on. When we get behind a snow fort, we think we are all right, and so forget to be careful; the first we know we are hit pretty hard. It is about the same with everything else. It is only by keeping our eyes open that we are able to keep out of the way of things that would do us harm. The moment we begin to say that we are safe and can't be hit, we are in danger from a stray shot.

A snow storm in the city changes life entirely. The wind comes sweeping down the narrow streets wi' hardly a chance to escape. The snow piles up over the door steps in great drifts. This makes work for the poor people. Men and boys go about with shovels to clear away the snow. They generally get 25 cents for clearing away the space in front of a house. Oftentimes the people give them more. The cold weather makes sad suffering in the places where these poor people live. Many of these poor little fellows that shiver all night in a cold attic, would be glad enough of a home in the country where they could be near a good fire and have plenty of fruit and nuts to eat. Don't think of coming to the city boys, you are well off where you are.

I saw some news boys eating their dinner the other day. They were ragged little fellows, without any overcoats or mittens. They had to jump about and dance to keep their feet warm, and blow on their hands to thaw out their fingers. They stood up in front of a counter to eat. What did they have? This was about the bill of fare: A plate of baked beans, two pieces of bread, a cup of coffee and a doughnut. That cost them 10 cents, and I guess any one of them could have eaten three times as much. They have to sell 10 papers to earn enough to pay for that dinner, and many of them had no home to go to when their work was done. This will be a good thing for the Cousins to remember when they think they are having a pretty hard time.

LETTERS FROM THE COUSINS.

WE can have a long letter this week, introducing a great many new Cousins. The new year has brought a great many.

BERTHA HADLY lives in Thorntown, Indiana. She does not see many letters from her State. The Indiana Cousins should remember this. Bertha would like to have some of the Cousins write to her. She has a canary named Bobby which sings almost all the time.

TOMMY STEVENS took some Gem Squashes to the fair at Trenton, N. J., and took the second premium—well done! He is going to try and get the first next year. The fair was a good one, with no betting and horse racing. That is the kind of a fair we all like to attend.

RETTA M. AVERY lives at Lebanon, Mo. She gives Uncle Mark a very kind invitation to call on her. She likes to live in the country. Her Mamma has lots of nice plants, including 16 varieties of cacti.

MARY B. WILSON lives at Hays City, Kansas, with her brother. She can milk, and help feed the chickens. She planted the Garden Treasures last year and had some very pretty flowers.

VIOLA MAYHEW lives two miles from town. She has a pet kid and a colt. The geese make lots of noise. I expect they wake people up in the morning.

ROBERT M. COLT has little time for writing, for he has to walk a mile to school and take care of the school-house and fire. Mental arithmetic is his favorite study. He raised five bushels of pop-corn.

MANLY AND DARWIN LAWRENCE raised 150 chickens, doing all the work without help. They had for their share every fifth chicken, and got $7.50 for what they sold. I like to see boys have a chance to work that way. They gathered 2,880 eggs. They have made in all $12. Pretty good, boys. The new house is nearly done. They have bought a carpet for their room and their Mamma has made it. Next year they want to make enough to get some furniture. That is a good way to spend the money, I think.

EMORY C. SPENCE reports wheat very poor, oats pretty good, rye good, buckwheat a larger crop than usual, no peaches and a large crop of apples. The White Elephant and Rural Blush potatoes were both very good.

NANNIE L. PECK lives in California. She has been reading the letters in a copy of the RURAL she found at her grandmother's house. Did any of our Northern Cousins ever think what Christmas in California must be like?

SADIE E. STEIGLEDER wants to hear from Aunt Beth again. I am sure we all say the same. Sadie has two brothers who have bought a farm in Virginia. If she moves down there she will have to tell us all about the country.

WILBER F. SAXTON wants me to be sure and wish all the Cousins "Happy New Year." Wilber's father caught a flying squirrel. I wish we could see it. Wilber has bound the RURALS for 1884. How many Cousins can say the same.

MABEL DARLINGTON had a battle with the grass-hoppers for the possession of her beans. The grass-hoppers beat. Her Papa says he has found one thing that the "hoppers" will not eat, and that is the vine of a pumpkin. They would probable eat pumpkin pie though. Mabel won a prize for good attendance at school.

OLIVIA B. SELL writes that the cut-worms thought everything of the tomatoes. The Johnson Grass did not come up. The peas were very nice.

ANNIE L. BRYAN lives in Maryland. They have a molasses mill on the farm. They raised some peanuts and some chufus—the latter they do not like very well. They had a very large crop of turnips.

ANNA MASON writes a very nice letter. She lives in Western New York. She has a canary, two cats and three little chickens. The latter will fly up in her lap and eat out of her hand. Where she lives they have been drilling for water, and have an artesian well 314 feet deep which flows 75 barrels an hour. We would all like to know more about that. One of the neighbors who is 73 years old, has pieced a quilt containing nearly 4,000 pieces.

LOUISA SCHOENFELD says that her Mamma tells her that she never heard that story about the black cat and the baby that was in the RURAL some time ago. Her Mamma was brought up in Germany too. Louisa can make good bread, though she is only 11 years old. I am glad she can help her Mamma. Her brother, John, takes care of the horse and cow and cleans the hen house every Saturday. He is going to have a piece of land next year. I suppose he will raise quite a crop.

KATIE JACK would much rather live in the country where she can have a good garden, than to live in the city or town. When she has her farm she says she shall consider the RURAL as necessary as the garden hoe. A great many people do not use either as they should.

CHRISTIANA E. ANDERSON lives in a very wild place on Puget Sound, eight miles from British Columbia. In clear weather they can see two mountains that are covered with snow all the year round. They have very little school there.

R. B. DE FREEST has a black goat named Billy that will draw him around. I hope Billy is better natured than some other goats I have known. The dog is named Frisk and the cats are Bessie, Snow, Beauty and Tab. If you have a piece of land next year, I hope you will work it well. I think the beans and onions would make a good crop.

OBIE FREGEMBA lives in Carbondale, Kansas. He raised some potatoes, onions and turnips. His father gave him a pig which he sold this Fall. It weighed 275 pounds.

ORA E. EVANS builds the fires at the school house. He raised a great many cabbages, but they were so plenty that there was no sale for them, so he buried them. One head was so large that a half-bushel basket would not go over it. That *was* a cabbage, wasn't it?

DEAR UNCLE MARK: I am a little girl 13 years old, and would like to join the Y. H. C. We live on a fruit farm two miles from South Haven. We are right in sight of Lake Michigan. I go down to the lake sometimes and gather pebbles and make sand houses. We can hear the lake roar very plainly. There was a young man living here who was working on a vessel on the lake. He was almost home from his last trip, when in some way he fell off from the boat and was drowned. It was very sad. I sometimes go down to the lighthouse and see the lamps lit. We have two kittens. One is named Mollie and the other Tabby. We have two horses, one cow, two canaries and a great many chickens. Papa has been building a new hen-house. We have a great many flowers. Papa is in partnership with another man in a greenhouse.

Your loving neice, INEZ MERRILL.

Leaves the earth well pulverized at bottom of furrow. Marks any width from 2½ to 5 feet, and from a mere mark to 8 inches deep.
"Take pleasure in recommending it. It does the business; is well made and will last for years." *J. S. Collins, Moorestown, N. J.*
"It far exceeds my expectations. If the real merits of this cheap implement were known to potato growers alone, the sales would be immense." *E. L. Coy, Pres. Wash. Co. (N. Y.) Agr. Society*
H. W. DOUGHTEN Manufact'r, Mooreatown, Burlington Co., N. J.

Dyspepsia
Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds; it will cure you.
Hood's Sarsaparilla
Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

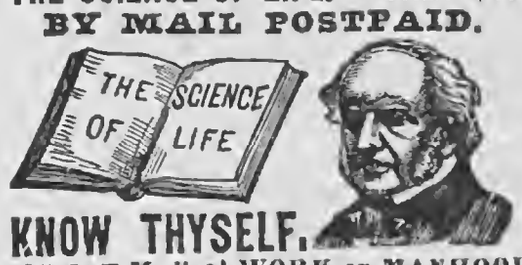
THE SCIENCE OF LIFE. ONLY $1.
BY MAIL POSTPAID.



KNOW THYSELF.
A GREAT Medical WORK on MANHOOD.
Nervous and Physical Debility, Premature Decline in man. A book for every man, young, middle aged and old. It contains 125 prescriptions for all acute and chronic diseases, each one of which is invaluable. So found by the author, whose experience for 23 years in such has probably never before fell to the lot of any physician. 300 pages, bound in beautiful French muslin, embossed covers, full gilt, guaranteed to be a finer work in every sense—mechanical, literary and professional than any other work sold in this country for $2.50, or the money will be refunded in every instance. Price only $1.00 by mail, postpaid. Illustrated sample 6 cents. Send now. Gold medal awarded the author by the National Medical Association, to the officers of which he refers.
The Science of Life should be read by the young for instruction, and by the afflicted for relief. It will benefit all.—*London Lancet.*
There is no member of society to whom The Science of Life will not be useful, whether youth, parent, guardian, instructor or clergyman.—*Argonaut.*
Address the Peabody Medical Institute, or Dr. W. H. Parker, No. 4 Bulfinch Street, Boston, Mass., who may be consulted on all diseases requiring skill and experience. Chronic and obstinate diseases that have baffled the skill of all other physicians a specialty. Such treated successfully without an instance of failure.

PERSONALS.

SENATOR BECK'S son George is getting rich on his Wyoming ranch.

ADMIRAL D. D. PORTER is seriously ill at his residence in Washington.

MR. JAY GOULD is now on his Southern trip. It is not likely that he will go beyond Panama, although he had planned at first to visit Rio Janeiro.

THE will of J. B. Lippincott, the Philadelphia publisher, leaves to his children property amounting to over $2,000,000. The publishing business is to be continued by his sons.

WILLIAM H. GUION, Jr., who became the head of the Guion line of steamers in this country on the retirement of his uncle about two years ago, died at New York last week, aged 38 years.

JOHN LIVINGSTONE, who claims to be a brother of the African explorer, died in the Albany penitentiary a short time ago at the age of 80, a victim of typhus. He was well educated and had no vicious habits, but was a professional tramp.

PRESIDENT GREVY celebrated his re-election by giving the boys in the national schools a holiday, and the Conservative papers charge him with trying to "make himself solid" with the rising generation of voters, with a view to getting a third term!

MR. PARNELL is a bachelor and lives the simplest sort of life—in lodgings, as a rule, taking his meals at a hotel. His habits are so quiet that he and his sister Anna were guests at the same hotel for weeks without knowing that they were under one roof.

THE man who holds Lamar's seat as United States Senator from Mississippi, is Gen. Walthall, "a tall, thin, ruddy-faced man with long, iron-gray hair, which curls into a half-roll as it kisses his old-fashioned, Henry Clay collar." He is a great friend of Jefferson Davis.

M. PASTEUR thinks that some of his disciples are going a little too fast. He advises them to wait awhile before they take definite steps to apply his method of treatment on a large scale to cases of hydrophobia. He will not be able to furnish specific data himself until March.

THIS is the way in which a Western paper gives the news: "In the Solferino Mine, Nevadaville, Col., a loose rock knocked A. Warren out of the bucket. A piece of jaw bone was found at the 1,200-foot level and a piece of skull and a coat at the 1,300-foot level. These comprised his recoverable effects."

AT this moment it takes 22 policemen in relays to watch Lord Kenmare's mansion at Killarney against the hostility of his tenants. Each policeman, by the time all is told, costs nearly £100 a year, so that the Government (that is, the taxpayers of Great Britain and Ireland) are at this moment paying £2,000 a year for the protection of Lord Kenmare's mansion.

WE are glad to learn that C. C. Georgeson, our old young friend on the RURAL editorial staff, and later Professor of Agriculture in the Texas State Agricultural College, has been appointed Professor of Agriculture and Horticulture at the Imperial Agricultural College, Tokio, Japan—salary $255 per month. His engagement is for three years. May success go with him wherever he may go!

STABLE FITTINGS A SPECIALTY.

Humorous.

A GENTLEMAN talking the other day to a bright little five-year-old boy, asked him, "Do you ever fight at home?" "Oh, yes," said the boy. "Well, who do you fight with?" "Oh, my sister." "Well, who whips?" "Oh, mamma whips."

LITTLE Emma came running into the parlor, where her mother was entertaining young Mr. Dudder until Miss Mary would complete her toilet and come down stairs, and cried, "Oh, mamma! Johnny is dot Mary's teef, and won't give 'em to her."

LITTLE boy (at the front door)—"Is the doctor in? Cause if he is, I want to see him right away." Servant—"He's not in." Little boy—"Well, just as soon as he gets home you tell him to come over to our house and take that baby off he left there last week. Its in the way."

MRS. SMITH (talking to Mrs. Brown about one of the latter's visitors who always remained longer than she's wanted)—"Dear me, Mrs. Brown, and you've got Miss McCall visiting you again. How slim she's looking. Don't you admire her waist?" Mrs. Brown (shortly)—"Weel, I micht admire it if her stays were'na sae lang."

A PASTEUR-AL SKETCH.

Mike, with a foot badly swollen from the bite of his dog, applies to the doctor for advice, leading the offending brute.

Dr.: "Well, Michael, hydrophobia is so very prevalent just now, I think it well that you should be vaccinated, using virus from the brain of a rabbit."

Mike: "Shure, Dochther, its not hydreophobies o'im afther fearin', but the sphalpeen was just afther aitin' a yard of sthore sausage, and its the Thriconeesis wurrums that o'im feared 'll be crawlin' troo me fut."

Miscellaneous Advertising.

It seems impossible that a remedy made of such common, simple plants as Hops, Buchu, Mandrake, Dandelion, etc., should make so many and such great cures as Hop Bitters do; but when old and young, rich and poor, pastor and doctor, lawyer and editor, all testify to having been cured by them, you must believe and try them yourself, and doubt no longer.

GENTLEMEN—Your Hop Bitters have been of great value to me. I was laid up with typhoid fever for over two months, and could get no relief until I tried your Hop Bitters. To those suffering with debility or any one in feeble health, I cordially recommend them.

PROGRESSIVE HORTICULTURE.

CHRYSANTHEMUMS.

JOHN THORPE.

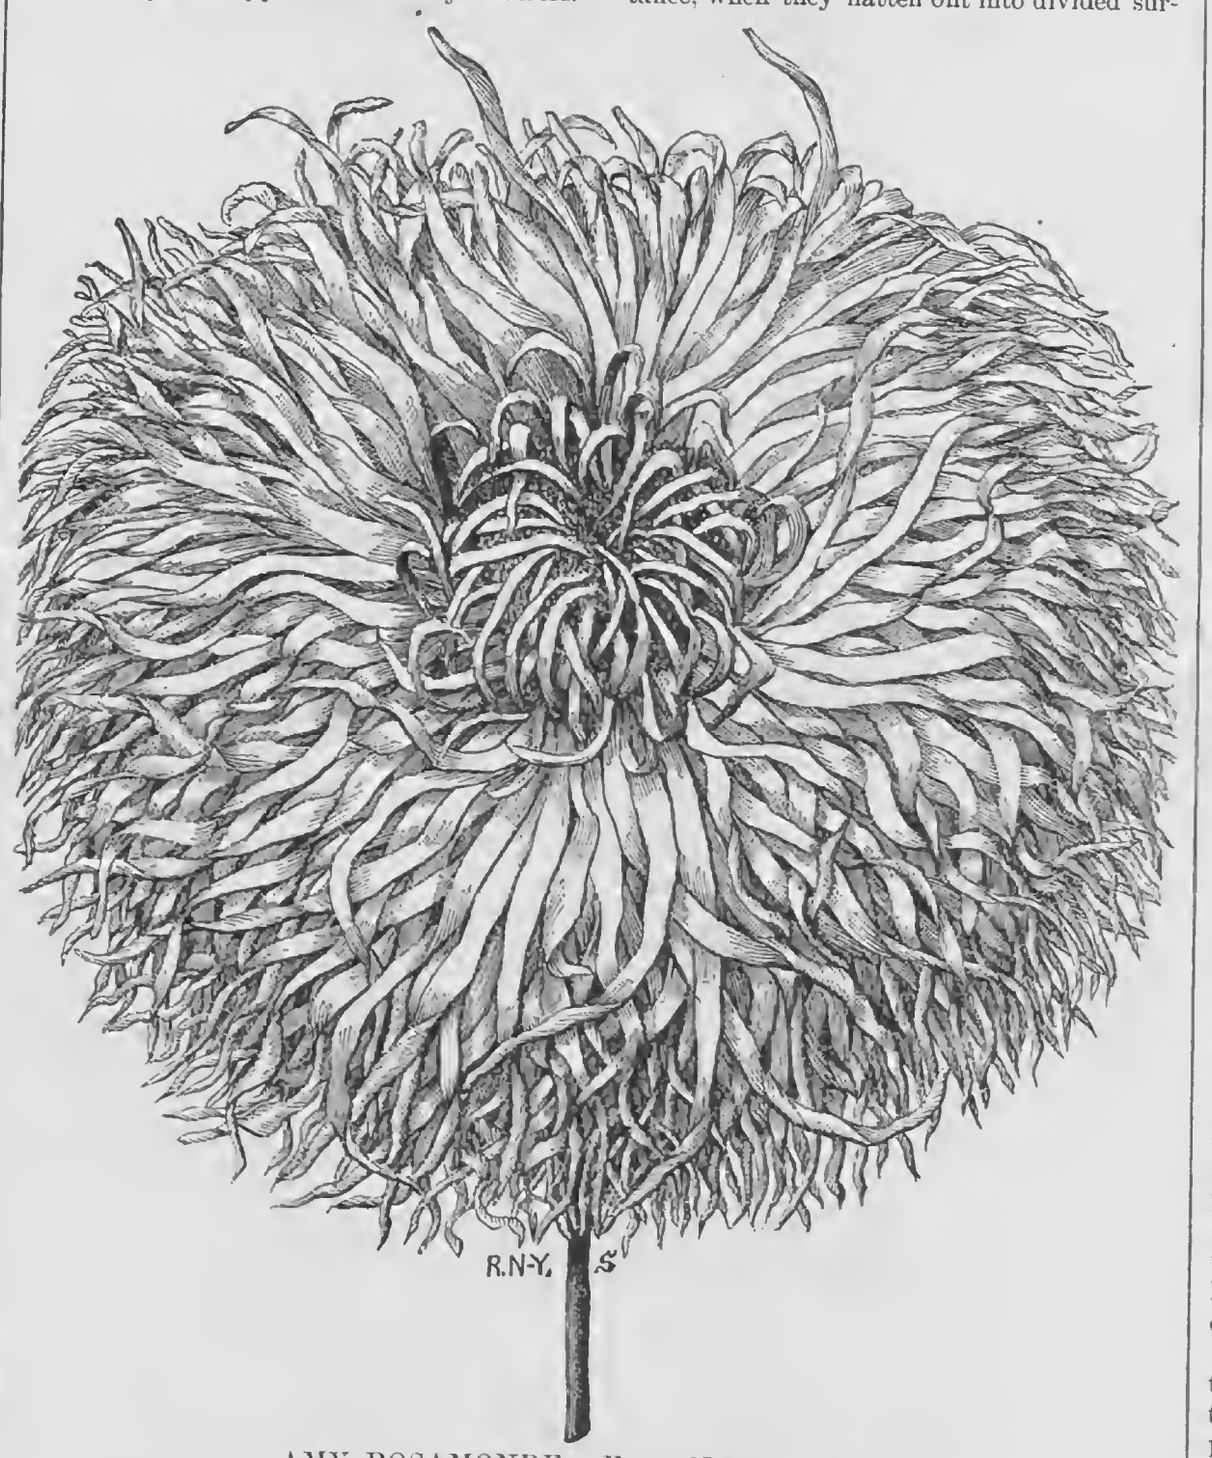
AS to what can be done by intelligent and persistent application of well directed efforts in the production of new and handsome varieties of flowers from a very limited groundwork, we have only to compare the different classes of pelargoniums, Chinese Primulas, the Tuberous-rooted Bolivian Begonia and the chrysanthemums, with varieties of 20 years since. The pelargonium, known as the Scarlet Geranium or Fish Geranium, had flowers at that time defective in nearly all properties: loose and thin separated petals with colors very limited, small trusses of flowers, and straggling habits of growth. The Chinese Primroses were of only two shades of color—a very indefinite lilac and a white, tinged with green and pink. The flowers at the very largest were not more than three-fourths of an inch in diameter. Compare these with the brilliant carmines, crimson-purples, the superb whites, to say nothing of the various striped flowers two inches across, with elegant serrated edges. Then the begonias are really beyond the most enthusiastic hybridizer's imaginations, bounding to the fore, as they have in 15 years, from two straggling species with loosely formed flowers, to those of to-day having flowers double and single, many of which are fully six inches in diameter, of nearly all shades of red, yellow and white. As to the chrysanthemum, it has become so revolutionized, erratic and changed that one is wont to exclaim, "What next?" Some new forms appear each season and are interesting not always developing in one season, but growing into marked characteristics after one or two generations. At first these forms will appear in one or two colors; after gaining a foothold they will gradually take on the whole range of colors as found in the older forms, grouping together as a family, having in many cases a distinct likeness to each other in habit, shape of leaf, and greater or less prolificness in throwing up growth, as well as in time of flowering. Some of the most interesting new types are truthfully illustrated in the accompaning drawings.

It may be well, however, to say something about the colors and other traits of these progressive varieties. As to tracing up their ancestors to be able to find out whether any special kinds are Japanese, Chinese or Indian, it would be useless, as I am convinced peculiar characteristics of these species have long since been obliterated, and all we have now is one grand family related as are the Saxons, Celts, Normans and Americans; but no distinct race.

Amy Rosamonde (Fig. 37) is a very distinct flower; its peculiar flat petals for a fourth of their length give an almost unbroken surface of coloring, after which they curl into innumerable shapes, drooping gracefully to the stem, a few petals remaining stiffly incurved to the center. It is of a peculiar brassy yellow color, and rather late in flowering.

Lilie Burgess (Fig. 38, p. 70) is opposite to the preceding, and quite new: the petals have a thick texture of a pure rose pink, incurving very regularly to the disc, which is composed of tubular florets having small petals known as "anemone-flowered," instead of the ordinary florets of the species. There is another type having small anemone flower discs where the petals recurve their whole length.

Frank K. Wilcox (Fig. 39) resembles very much some of the best forms of African marigolds; is of a rich golden amber color, very prolific and persistent. It is a persistently flowering variety and a type that has many admirers.



AMY ROSAMONDE. From Nature. Fig. 37.

Pitti-Sing (Fig. 40, p. 70) is a very interesting and distinct kind. It can be readily seen how peculiar are its petals; tubular for nearly their whole length; the first being the longest, after which each whorl gets shorter until some actually fail to get out of their disc. The tubes are silvery pink; whilst the lobes are claret crimson. Of this type the first appeared in 1884; the past year no less than 10 colors having the same peculiarities, have been added.

The flowers shown at Figs. 41 and 42 (p. 71) are seedlings not named and perhaps the most remarkable among the numerous types. Fig. 41 has petals tubular for a quarter of their distance, when they flatten out into divided surfaces of various lengths, some of the petals having three divisions over an inch deep and spreading fully three-quarters of an inch. Fig. 42 has the same division of the petals of their extremities, but the bases are flat and strap-like. Many colors have appeared in these two types; but as yet no very dark or pure yellow. It may be justly considered that these two types will become very popular after further development.

East Hinsdale, N. Y.

FRANK WILCOX. From Nature. Fig. 39.

MR. ALLEN'S CHRYSANTHEMUMS.

WILLIAM FALCONER.

MR. ALLEN is an amateur living at Woodbridge, N. J. At the chrysanthemum exhibition of the New York Horticultural Society last November, he showed some of the finest flowers I ever saw either in this or any other country. He writes me as follows: "He who would have chrysanthemums in his garden, must have chrysanthemums in his heart."

HIS GARDEN.—"I have no glass-house," he says. "All my plants were raised in the open ground, not so much because I thought it the best way, but from sheer necessity, to save labor and expense. The soil at my place is heavy clay of the most intractable kind, so that when a very dry season comes, you can crack a hickory nut on it. I have mitigated it all I could with wood and coal ashes. I lift and put my roots in the cellar in the Winter."

SPRING TREATMENT AND PLANTING.—"In May I take the roots out of my cellar and divide them. I take the shoots coming up from the roots. Mine were planted about two feet apart, and I grew few shoots to a plant."

SUMMER CARE.—"I give them all the gardening skill I happen to possess, and watch them with loving care from the moment they leave the ground till the blooms appear. I keep the wind from beating them, the bugs from eating them, and the neighbors' hens from scratching them up.

STAKING is important. I am very careful to stake them well, for nothing so injures them as being beaten about by the wind, as the buds are easily whipped off by a heavy blow."

WATERING.—A dry season does them great injury, and my plants suffered much in this respect during the Summer, and I had to carry water from my well to keep them from perishing.

MANURING.—"Like other plants, they need to be well nourished. I use any good manure I can get. I do not see that it makes much difference what kind I use."

AUTUMN CARE.—"I protect the buds from the hot sun of early Autumn, which is apt to do them much harm. Sometimes I take paper and fasten it over them and sometimes stretch muslin above them, all of which is very troublesome."

TO GET LARGE FLOWERS.—"I keep them from over-blooming by disbudding more or less according to the vitality. In fact, being an ardent lover of these and other flowers, I give them the most zealous attention from the beginning to the end, and never neglect anything that will tend to their growth and development."

CARE WHILE IN BLOOM.—"I had a light frame-work of wood made like the skeleton of of a small house, over my plants, and stretched on it unbleached muslin. I am free to say, however, that I'll not do this again, as the anxiety is too much, for if a very cold spell should come, as it nearly always does, the flowers are about ruined. This happened to me and I made up my mind that if I could not have glass next year I would not touch chrysanthemums."

MUSLIN COVERING FOR CHRYSANTHEMUMS.

I GROW an enormous quantity of chrysanthemums, and bloom the whole of them out-of-doors, partly in beds and blocks in warm sheltered places, for garden decoration's sake, and partly under a muslin covering as described by Mr. Allen for yielding cut-flowers

Last Fall I had 500 plants under the muslin covering and was extremely well pleased with the result. They began to bloom as early as the earliest in any part of the garden and my last gathering from them was on the first of December. By that time most of the

plants had done blooming, and only a few of the latest varieties would justify me in keeping them longer, even in a green-house. The muslin was sewn i_to large sheets, one for each side and to meet past the ends, and one for the roof and to overlap a little. In fine weather I removed the muslin, and replaced it at night and, in the event of rain, high wind or frost, kept it on in the day time. A few degrees of frost for a brief time will not materially hurt chrysanthemum flowers. The muslin will not exclude a severe frost, especially if accompanied by wind. The cloth, in tight sheets throws off the rain pretty well But wind is hard against it, It often is a difficult matter to save the muslin from being blown off or torn off by winds, and as we well know, November is not the calmest month in the year.

THE CHRYSANTHEMUM AND ITS CULTURE.

C. E. PARNELL.

I DO not know of any class of plants that are so easily grown or require so little care as the chrysanthemum, and I often wish I was in a position to insist that every lover of plants should have at least a few dozen chrysanthemums. As generally cultivated, this plant is not very handsome for pot use; for, as a rule, it is planted in the mixed border and left to take care of itself, and when the time of flowering arrives it is found to be ill-shaped or else partially broken, certainly well enough to supply cut flowers, but not at all adapted for decoration or exhibition purposes, or for use as a pot plant.

Now if we would obtain nice specimens we must give them a proper place in which to grow and develop during the summer season, and I insist on their being given a properly prepared border of their own. Let this be prepared by digging trenches to the depth of at least two feet (if deeper so much the better) and at the same time working in, thoroughly a good supply of well decomposed stable manure. Do not be afraid of using too much manure, as the ground can scarcely be too rich. The border being properly prepared, the next consideration is the planting of the young plants, which should be done about the first of May. They should be planted in rows, about three feet apart each way, and in order to prevent them from being broken off by the wind, a stout stake should be placed by each to which it should be loosely tied as soon as it is large enough. About the first of June the plants should have the center shoot or shoots pinched out in order to induce them to branch freely and in a few weeks there will be from six to eight strong shoots, which also must be pinched back as soon as they are about four or five inches in length, and this pinching back must be continued whenever necessary until the first week in August, when all the shoots must be left to grow.

During the summer season the plants must be loosely tied to stout stakes in order to prevent them from being broken off by the wind, and at all times they should be well cultivated and kept clean and free from weeds. In dry weather they should be frequently and thoroughly watered. Never permit them to suffer in the least for water. About the middle of September they should be carefully taken up and potted, using pots proportionate to the size of the plants. Drain them well and use a compost composed of one part of well decayed manure and two parts of well decayed sods. When first potted, water thoroughly and place in a shady situation for a few days or until they have taken hold of the soil, after which they can be fully exposed to the sun until there is danger of frost, when they should be brought inside, but do not give them any more fire heat than is sufficient to keep out frost. After they have been potted, keep them well supplied with water, even if it has to be given three or four times a day, and it is well to give them, two or three times a week, some liquid manure water (guano water being the best), and it should be given in the proportion of an ounce of guano to three gallons of water.

After the plants have ceased flowering, they can be removed to any cool position, such as a cellar where some light can be admitted, and where they can be kept in a dormant state until about the first of April, when they can be brought into a light, warm situation and started into growth, and just as soon as the shoots are of sufficient length, cuttings should be taken. These, if placed in sand in any warm situation, will root in a short time, when they should be potted off into three-inch pots and carefully grown until the weather has become settled, when they can be planted out in the chrysanthemum border.

Some attempt to carry over the old plants for another season's bloom, but, as a general rule, I do not advise the attempt, as young plants are so easily obtained, and they prove to be of better habit and more vigorous growth, to say nothing of their far superior flowers.

The only insects to which chrysanthemums are subject, are the Black Aphides, and these can be easily removed by dusting the plants with tobacco dust; and if, as occasionally happens, the common white mildew attacks them during wet weather, it can easily be exterminated by dusting them with sulphur while they are wet with dew.

There are so many varieties in cultivation, that it is very difficult to make a selection of the most desirable; but as a guide to those who contemplate cultivating the chrysanthemum for the first time, I enumerate a few of the most distinct:

Twelve Japanese: Julius Scharff, Mrs. Wm. Barr, Elaine, Fantasee, Grandiflorum, Katakana, La Frizure, M Castel, Juvena, Riche Bouquet, The Sultan, and Triomphe de la Rue de Chatelets.

Twelve Chinese: Virginalis, Temple of Soloman, Prince of Wales, King of Crimsons, L'Africaine, Golden Beverly, Dr. Sharpe, President Wilder, Refulgens, Faust, Felicity, and Lady Talfourd.

Twelve Pompone: Bob, Fimbriata, Mdlle Marthe, Lucree, Golden Mdlle Marthe, Perle des Beautés, Salamen, Sanguineum, Souvenir de Jersey, La Vierge, Amaranthina, and Model of Perfection.

Twelve Single: W. Falconer, Septimus Lyon, Rosalind, Pyrethrum, President Arthur, Peter Henderson, Mrs. C. L. Allen, J. W. Chambers, America, Mrs. Gubbins, Zephyr, and James Y. Murkland.

Queens, N. Y.

LILIE BURGESS. From Nature. Fig. 38. (See first page.)

I HAVE one fault to find with the RURAL, though I do not know how to suggest a remedy. It habitually prints good articles on both sides of its leaves, so that we who make scrapbooks must either subscribe for two copies, or else lose many good things that we would gladly keep. "Preserve the whole paper," you will say. Too bulky. If we preserved all the good newspapers, we should soon have to build a house to hold them.—[This may be so with a few who take a number of papers; but not in the case of the vast majority of people.—EDS.]

PITTI SING. From Nature. Fig. 40. (See first page.)

* * *

The RURAL is annoyed by pea-weevils. In making crosses it is easy to tie a bit of mosquito netting around the young pods as soon as they commence to enlarge. Last season, I preserved the second crop of a very promising cross by inclosing the whole row in mosquito netting as soon as the plants commenced to bloom. The cost is slight, where there are but few plants to cover, and it saves every pea. Treating with bisulphide of carbon after ripeness makes them all right outside, but the germs of some have already been destroyed. [Thanks.—EDS.]

* * *

Yes; we succeed in growing cabbages from leaf cuttings, but I fear this method of propagation will never have any practical value. The sections root very promptly, no matter from what part of the head they are taken; but it takes two-and-a-half to three months for the bud to start. All of this time, the slips are subject to dampening off and the attacks of aphides, and but a very small percentage of them ever form buds.

* * *

The RURAL criticizes our opinions as to the flavor of different raspberries. I wonder whether it made a more thorough test? I had a basketful of each kind set on the table before me. The Early Prolific seemed poorest, so I took this for the standard. I first tasted a few berries of this sort, then of another, comparing the two, and making my notes. I tasted the standard again and then a third variety, and so on. Where the flavor of two seemed to have a close resemblance, I tested these with each other. In cases of doubt, I called in a second party to decide. But we are all fallible. [True.—EDS.] E. S. GOFF.

Geneva, N. Y.

Sheep Husbandry.

Notes from the Rural's W. N. Y. Farm

FEEDING LAMBS.

THE FEEDING OF GRAIN

is an absolute necessity, if the largest profits are desired. It is a fact that with proper care lambs may be wintered on an exclusive diet of hay and other fodder with roots so as to make some growth; but the increase will be so little, and the proportion of food used in mere existence is so great that the gain made will not pay for the trouble, interest and risk. This we will endeavor to show by and by so plainly as to convince the most skeptical. What we are after in the winter feeding of this class of sheep is a large increase in flesh and wool, and to secure this it is imperative to feed, and feed high with grain. And, besides this, we wish the resulting manure for the enrichment of our farm.

As before said, grain feeding should have been commenced while the lambs were still at pasture, and if so, they have become accustomed to its use, and will scarcely have noticed the change from grass to dry forage. But, while at pasture, one feed daily is sufficient, they should be fed twice a day as soon as they are properly penned and sorted; and this is as often as they will need it at any time while being fattened.

A VARIETY OF GRAINS

is preferable to any one kind. In sheep feeding, we have at least three important ends in view: the production of meat, the growth of wool, and the amount and value of the manure made. But we must remember that while in feeding a mature sheep, the principal gain in weight would be simply fat, whether mixed through the muscles, or stored inwardly or upon the outside of the carcass it would be entirely different with a bunch of lambs. With the latter there should be made a gain of at least 40 pounds, of which at least 20 would be lean meat, bone and wool. So that while the food of the mature sheep should be largely those grains rich in carbo-hydrates or fat and heat-producers, of which none are superior to corn; that of the lambs must contain not only a supply of these elements, but a large proportion of such foods as have abundance of the albuminoids or nitrogenous elements, and also of the phosphates, the phosphates being for the bone growth, and the albuminoids for the production of the lean meat and wool. Of the latter class of food, oil meal, cotton-seed meal, and bran are all superior, the latter also supplying an abundance of phosphates. Barley is a capital lamb food, and so are oats, beans and peas, but at the usual prices of these, the same amount of nutrition may be obtained more cheaply in other forms. For lamb feeding, a mixture of three parts of corn, two parts of bran and one part of oil meal, is well adapted where the principal forage is clover hay, and straw is used as a relish and for bedding. But where compelled to use corn fodder or meadow hay as a principal forage, the proportion of oil meal should be doubled.

MALT SPROUTS;

are they a good food for lamb feeding? we are asked by two or three friends. We have tried them to a limited extent, but so far, we have never succeeded in getting them so combined that the lambs would eat them well. Mix them as we would, the other ingredients were selected out and the sprouts left, or when mixed with bran and oil-meal, so as to be inseparable, the lambs would refuse the mixture.

We know that chemically they show a very high value as feeding stuff, being extremely rich in nitrogen, but,so far, our experience in their use for sheep or cow feeding. has not been at all satisfactory.

We now have the pens all cleaned of manure the first time over, and all the sheep are doing splendidly. We have 175 young lambs, and the number is increasing very rapidly. Quite a number of the older ones are ready for market, and will be sent as soon as there is a demand for young lambs.

The weather has been quite severe, though Western New York has the most uniform climate of any part of the Union: the coldest weather has been 1° below zero, but by operating the ventilators we had no trouble in keeping the barns at an even temperature of 55° even in the coldest days.

JOTTINGS.

We have several hen houses, each located in a different place in the orchard. They are double-boarded, with tarred paper between. and with large windows on the south side. In each we keep a stock of hens and by raising several broods of chickens in each,there is no trouble in keeping the hens and chickens scattered all over the orchards.

We have never found a better insecticide for all class of insects that ever come to the ground than an old hen with a brood of chicks, unless perchance it be a clutch of ducks. And our orchards, so far as the hens roam, are entirely clear from insects.

There is also a good margin of profit in the rearing of the chickens, especially so in an open Winter like this, when they are able to forage for almost their whole living. We sold January 12th over a ton of chickens, raised in the orchards, at 11 cents per pound for the bodies with the blood out and the feathers off. This pays better than pork at 4½ cents per pound dressed weight.

Dairy Husbandry.

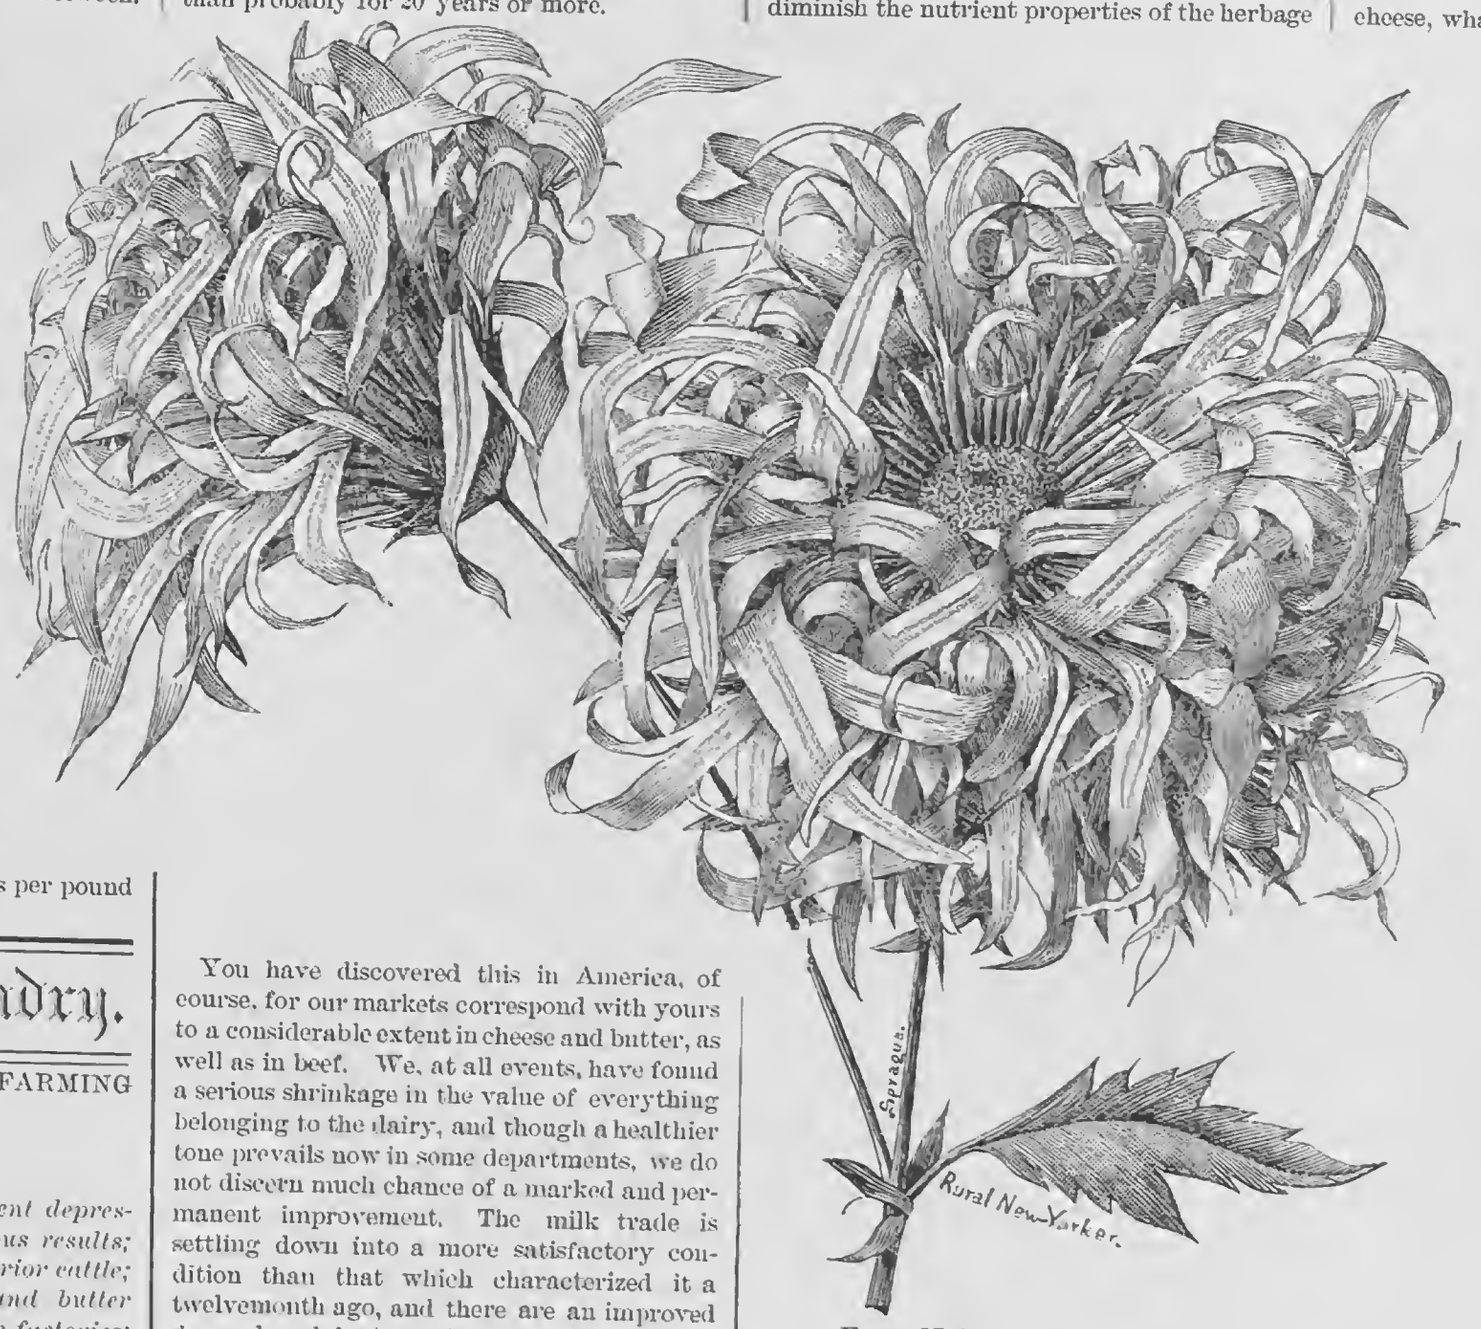
THE CONDITION OF DAIRY FARMING IN ENGLAND.

PROF. J. P. SHELDON.

Late prosperity of dairying, present depression; overdone trade; disastrous results; advantage of superior over inferior cattle; little improvement in cheese and butter making; reasons therefor; cheese factories; prospective prices.

THE year just concluded may be reckoned as the worst of the last twenty, so far as dairy farming is concerned. Other branches of agriculture had been laboring under severe depression for seven or eight years, particularly that devoted to grain raising, but, until the early Spring of 1885, dairy farming had been so far more profitable than any other sort,that no end of people began to look upon it with envious eyes, and it attained a measure of popularity which it never aforetime enjoyed. The long-sustained prosperity which had distinguished it, was the result of several causes, one of the chief of which was the high price of cattle; this in its turn was the result of a still flourishing meat market and a well sustained demand for beef. Stock-raising,which is or ought to be a prominent feature in dairy farms in general, remained a very good business, and farmers had no difficulty in disposing of anything good they had to sell in the way of cattle. Graziers made good prices off their fat stock, and the demand for barreners for fattening purposes was tolerably brisk the year round. Many dairy farmers, indeed, had relinquished dairying in favor of fattening, but they found after a time that fattening began to show signs of relaxation, and not a few of them returned to dairying once more, only to find that depression was coming upon that industry as well.

It was surprising, however, how well dairy farming held its ground, in the teeth of an almost all-round gloom. Cheese and butter had shrunk greatly in price since 1876, and the wet Summers had diminished the yield of both. Still, dairying as a whole, held its own well enough, all things considered. For this prolonged success we were indebted in no small degree to the milk trade, which continued to expand ever since the Adulteration of Food Act came into operation. In Winter particularly, the demand for milk had been, until last Winter, greater than the supply, and many efforts were made to meet the deficiency. These efforts, so far as meeting the demand for milk was concerned, were crowned with success a year ago, but the immediate result was a glutted market and a demoralized trade in milk. The price usually paid for winter milk was no longer sustained or remunerative, and down-calving cows declined pretty considerably in value. The milk-trade for years before had been regarded as the sheet-anchor of dairy farmers, relieving the cheese and butter markets, and providing a profitable outlet for what would otherwise have been surplus milk. But at length farmers saw with some dismay that the cherished milk-trade was no longer immaculately safe,the price of cheese kept on declining; butter was not a rent-paying product, and the price of cattle fell pretty rapidly. It may be said, in fact, that a drop of 20 or 30 per cent. has taken place in the value of cattle within 12 months, and dairy products have been lower in price during the past Summer and Autumn than probably for 20 years or more.



From Nature. Fig. 41. (See first page).

You have discovered this in America, of course, for our markets correspond with yours to a considerable extent in cheese and butter, as well as in beef. We, at all events, have found a serious shrinkage in the value of everything belonging to the dairy, and though a healthier tone prevails now in some departments, we do not discern much chance of a marked and permanent improvement. The milk trade is settling down into a more satisfactory condition than that which characterized it a twelvemonth ago, and there are an improved demand and better prices for calving cows; but in respect of young and barren cattle and of cheese, there is no improvement at present. Butter, it is true, has regained some of the position it had lost in the market, but this is simply because, in the depth of Winter, less butter is made; and the probability is that, with the approach of Spring, the value of butter will recede once more. So far as cattle and cattle and cheese are concerned, more particularly than in respect of butter and milk, the decline in value has taken place most of all in inferior specimens and qualities. There is more than cent per cent. disparity between good cattle and bad ones, and the same may be said in reference to cheese. While inferior cattle have shrunk some 40 or 50 per cent. in value, good stock have declined only 20 per cent. or so; and the original difference between them has to be reckoned within the computation. It was never plainer than now that it will not pay to raise inferior cattle, and we may hope that our farmers will permanently learn at all events this one important lesson of adversity.

It is more than disappointing to find that but little real, permanent progress has been made during the past 10 or 15 years in the practice of cheese and butter making in the farm-houses of England. A great deal of pains has been taken by the press, and in other ways, to inculcate sound dairy principles, but it does not yet appear that the rank and file of our dairymaids produce much better dairy goods now than they did a score of years ago. A few years ago there were signs of a general improvement, but there has been more or less of retrogression since. This retrogression is attributed to the wet seasons, which have done so much to reduce the fertility of the soil, to diminish the nutrient properties of the herbage and to lower the physical stamina of cattle. There can be no doubt that this explanation contains a good deal of truth, but the whole trouble is not in it. We are bound to admit, as a further and more potent explanation, that a disinclination to be taught lies at the root of the mischief with many cheese and butter makers. I admit the need of tuition is considered tantamount to a confession of ignorance, and this sort of thing does not commend itself to adult human nature on the average. [That is just as true on this side of the Atlantic as on the other.—EDS.] To seek for information is not popular with people who fancy themselves tolerably near perfection, and a spirit of emulation is inseperable from marked and general progress in such a thing as dairy work. Many opportunities for tuition in dairy matters have been offered to the public, who, I regret to say, have to a very limited extent availed themselves of such chances of improvement.

From Nature. Fig. 42. (See first page).

The cheese factories established in this country have done a great amount of good, but they have not been uniformly successful. We have no great number of them even now—perhaps 30 or so—but there is a disposition to increase the number. The chief reason why they have not become more numerous is found in the rapidly expanding milk trade of the last 10 or 15 years; but since the milk trade became upset, many farmers have turned their attention once more to cheese-making, and a few additional cheese factories have been built. The disastrous lack of uniformity in farm-house cheese, is a leading cause of failure in commanding high prices; and herein the factories have a great advantage, for factory cheese, whatever else may be said of it, is tolerably uniform in character. The low price of ordinary and inferior cheese of late years, has thrown a gloom over dairying, no doubt, and yet everybody knows that really good cheese is always in brisk demand, and even now commands a good price. We have a few butter factories in Great Britain, and most of them have done very well; have demonstrated the value of sound principles, and have returned a good price for the milk they manipulate. In Ireland, where dairy tuition has made very important improvements in late years, there is a growing consensus of opinion in favor of butter factories; and it may be expected that the Emerald Isle will, with the help of these institutions, regain a good deal of her pristine reputation for butter. Many Irish dairymaids are remarkably clever, thanks to the tuition disseminated by the managers of the Munster Dairy School.

That a low average range of prices for cattle and dairy produce will prevail for some time to come, appears highly probable, and we probably shall not see again in a hurry the halcyon days of 1871 and 1876. During the past ten years, much of the money previously made by farmers in England has been ebbing away, and also in dairy farming there has been a great deal of loss of late. A general statement of this sort holds good no doubt in respect of the Eastern States of America, and it is owing directly or indirectly to the vast territories which railroads have opened up to cultivation, and to the consequent increase of agricultural products. So long as the area of the cultivatable world was narrowed down for want of means of communication, the production, not of grain only, but of beef and of dairy goods, was necessarily limited; but steam has made, theoretically at least, the earth's production of food illimitable. This expansion we have to reckon with, in the future, and in view of it there seems but little chance of agriculture becoming a very prosperous business for some years to come. Yet, as nothing is so "certain as the unforeseen," a man does wisely in not pretending to be a prophet. Meantime we must live somehow, and cheap food is an untold boon to all the millions who toil and moil for their daily bread. In Britain, at all events, which cannot produce much more than the bread her people want, cheap food from abroad is of the first importance.

Surrey, England., Jan. 1st, 1886.

MILKING WHILE EATING.

SOME people advise that something to eat should be given cows while being milked. Now, I never can or could milk most cows with any comfort, while eating; for I have always found that it makes them uneasy and quite irritable to meddle with them in any way while they are feeding. Then they step back and forth to select the choice morsels of feed, and if they are chidden they are pretty sure to kick, no matter how gentle they may be at other times; and, moreover, they are very likely to withhold their milk. The better way is to give them a little feed or hay preferably the former, and let them eat it all up before one undertakes to milk them. This

satisfies them, and if properly handled they will give down their milk at once. If they don't get something to eat before milking, the result will be almost as bad as if they are milked while eating. In Winter I generally give mine their mess of feed just before and their fodder soon after milking, though it might be better to reverse the order. That's a matter of opinion however. C. L.

Morris Co., N. J.

Pomological.

HUBBARDSTON NONESUCH AND HUBBARDTON PIPPIN.

T. H. HOSKINS, M. D.

In a recent trip through the state of Maine, I visited the little city of Gardiner, on the Kennebec River. While there I met my old friend Robt. H. Gardiner, Esq. (from whose ancestors the city got its name). He is an enthusiastic and very successful fruit grower, and was for several years (until he declined further service) the president of the Maine State Pomological Society. He makes a specialty of the Yellow Bellflower Apple, which grows in great perfection on his soil and under his careful culture. I saw 400 barrels of these apples, not headed, but otherwise ready for shipment to Boston, where they command a fancy price. This fruit was of the largest size, fair, with the rich pink cheek only seen upon this variety when in its highest state of perfection. The soil of Mr. Gardiner's orchard is a rich, gravelly loam, and his trees are kept heavily mulched with oat straw. Great care is taken with the trees, especially in growing so as to admit the sun to the fruit on all sides, and they were models of health. The Yellow Bellflower is, I think, essentially a river valley tree, and so far as my observation goes, is rarely produced in perfection elsewhere. It cannot be grown profitably on the hills back from the Kennebec River, and it is the same on the Connecticut River. In Westminster, Vermont, I have seen this apple on trees but a few rods from the Connecticut, as fine as at Mr. Gardiner's, but fruit growers elsewhere in the State regard it as a failure.

While at Mr. Gardiner's, I was shown two apples, apparently quite alike, specimens of which I forward to the RURAL. When told that they were very different in season and in quality—that one was the Hubbardston Nonesuch and the other the Hubbardton Pippin—I at once declared that at least they must be seedlings from the same tree; but I was met with the statement that Hubbardston is in Massachusetts, while Hubbardton is in Vermont. Mr. Gardiner for a long time grew the Pippin for the Nonesuch, and believed it to be that apple, until repeatedly assured by Boston dealers that he was mistaken. He then obtained trees of the Nonesuch, and when they bore was able easily to see the great difference between them in all but looks. Then he set himself to work to solve the puzzle, and by the aid of Charles Downing and of Mr. Alfred Breezee, of Hubbardton, Vt., was able to establish positively the fact that his first apple, so like and yet so unlike the Hubbardston Nonesuch, was in fact the Hubbardton Pippin. The RURAL's pomological readers will agree that in undertaking this task and accomplishing it, he showed the true pomological spirit and set an example for us all.

As regards the two apples, the Nonesuch has been long and widely known as one of the choicest New England apples of late Fall and early Winter, and a standard market apple. But, so far as I am aware, the Pippin is little known, even in Vermont, and might have sunk into entire obscurity but for this strange, double coincidence of being like the Nonesuch both in name and looks. Yet it is far from being without merit, being large, handsome, a far better keeper than the Nonesuch, and, though not its equal in quality, yet a very good apple. I subjoin Downing's descriptions of both apples, adding that while he speaks of the origin of the Pippin as "uncertain," Mr. Breezee believed it to be a native of the town from which it takes its name.

HUBBARDSTON NONESUCH. Fig. 43, with cross section at Fig. 44, is a fine large, early winter fruit, which originated in the town of Hubbardston, Mass. The tree is a vigorous grower, forming a handsome branching head and bears very large crops. Young shoot, dull grayish brown, slightly downy. It is worthy of extensive orchard culture. Fruit large, roundish oblong, much narrower near the eye. Skin smooth, striped with splashes and irregular broken stripes of pale and bright red, which nearly cover a yellowish ground. The calyx is open, and the stalk short in a russeted hollow. Flesh yellow, juicy and tender, with an agreeable mingling of sweetness and acidity. Very good to eat, October to January.

HUBBARDTON PIPPIN. Fig. 45, with cross section at Fig. 46. Origin uncertain. Tree thrifty, spreading, irregular; a strong grower and productive. Young shoots clear reddish brown. Fruit large or very large, variable in form, globular, inclining to conic, slightly oblique, yellow, shaded and striped with red. Stalk short, inserted in a moderate cavity. Calyx closed. Basin small, corrugated. Flesh tender, yellowish, crisp, juicy, pleasant subacid, slightly aromatic. Core large and open. Very good. Nov. to March.

Entomological.

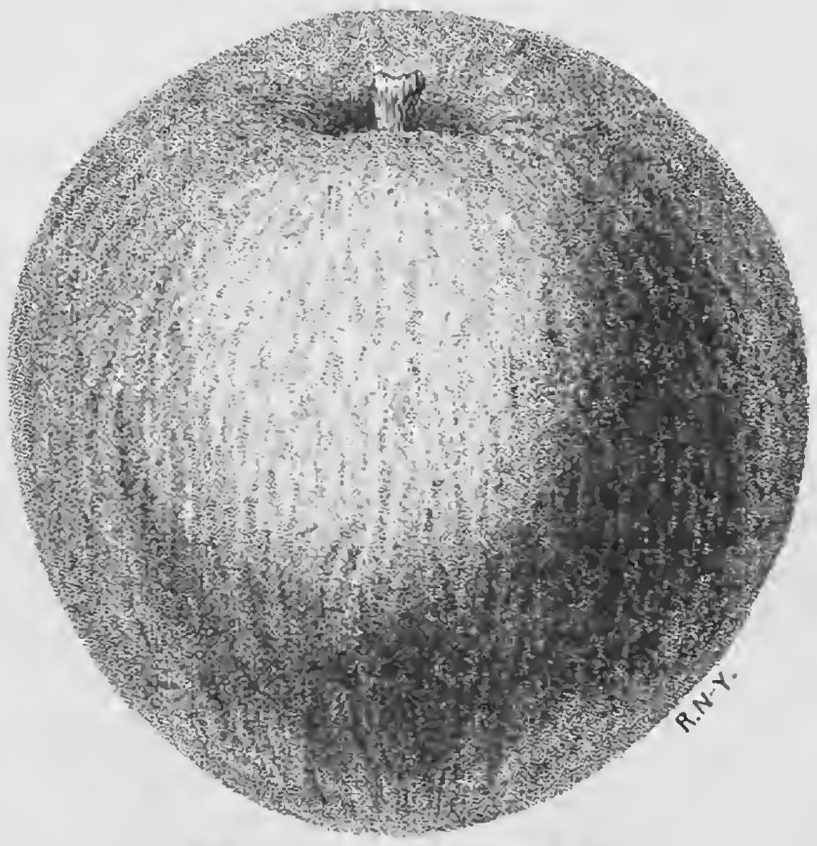
THE MILDEWS OF THE GRAPE-VINE.

AN EFFECTUAL REMEDY FOR PERONOSPORA.

DR. C. V. RILEY.

TWO CHIEF SPECIES.

THERE are very many fungi known to attack the grape-vine, as is evidenced by a glance at such works as "Funghi parassiti dei Titigni," by Dr. Romueldo Pirotta (Milan, 1877), or "Die Pilze des Weinstockes," by Felix von Thümen (Vienna 1878). But the two principal fungi, both of them popularly called "mildews," which interest the grape-grower, on account of the extensive injury they cause, are the Uncinula spiralis (Berkeley & Curtis) and the Peronospora viticola (Berkeley). Any popular statement in reference to grape-vine mildews, in order to be accurate, must take cognizance of these two species, which occur ordinarily under opposite atmospheric conditions. Failure to do so has wrought much confusion in the fugitive literature on the subject. As popularly distinguishing terms, it would be well to call the former the "Powdery Grape-vine Mildew" and the latter the "Downy Grape-vine Mildew."



HUBBARDSTON NONESUCH. From Nature. Fig. 43.

It is my purpose here to deal chiefly with the latter, but it will be desirable first to briefly consider the characteristics of the former, that the differences between the two may the more readily appear.

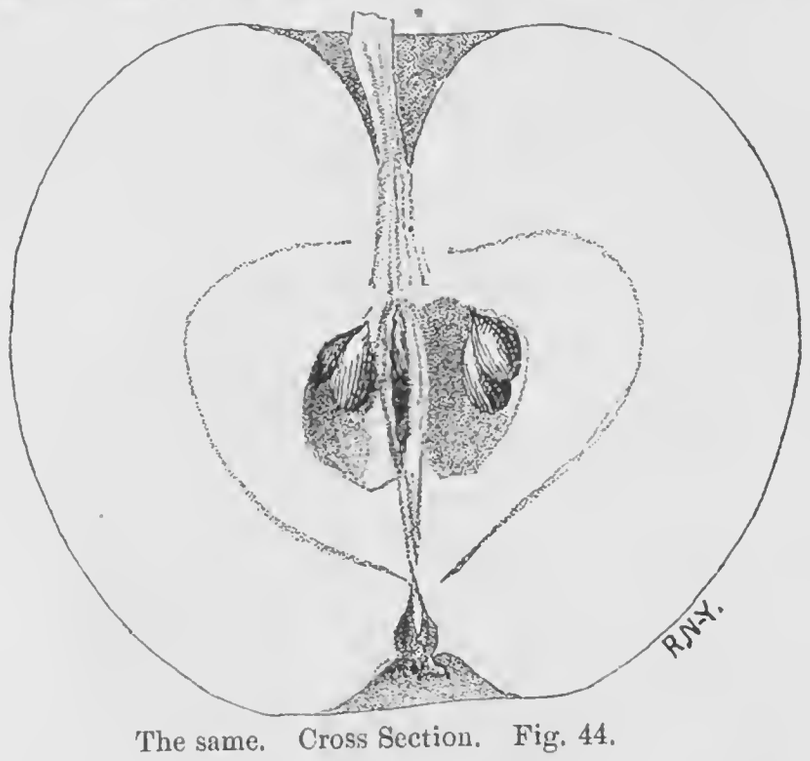
THE POWDERY GRAPE-VINE MILDEW.

This is the Uncinula spiralis (Berkeley & Curtis), and the conidial form has long been known by the name of Oidium Tuckeri (Berkeley.)

GENERAL APPEARANCE.—This particular fungus produces a white, powdery appearance on the upper surface of the leaves, which at first looks not unlike dust, and which is much less conspicuous on the lower surface. Beginning in spots, these grow larger and larger until they cover the whole leaf and include even the young stems and berries.

STRUCTURAL CHARACTERISTICS.—The powdery spots consist of mycelial threads attached to the epidermis of the leaf by suckers. These filaments have a diameter of .004 mm. Portions of this mycelium rise up from the surface of the leaf and become constricted or intersected (Fig. 47, *a* p. 74) thus forming cells. As these cells, which are the conidial spores, multiply, the terminal ones enlarge, ripen and drop off, so that a succession of conidial spores is formed. The spores germinate at once by pushing out a germinating tube, generally at one end.

Late in the Summer and Autumn, the perithecia and asci are formed, ripening about the first of October (Fig. 47, *b*). These are the resting or winter spores, and are small, black bodies occurring on both surfaces of the leaf and on the stems. They consist of an opaque sac with a cellular wall, from which a number of appendages radiate, to from three to five times the length of the diameter of the perithecium, and some of them either undulate, or spiral at tip. The perithecium measures from .07 to .12 m m. in diameter, and the number of appendages varies from 15 to 32. Inside the perithecia are the asci or sacs (Fig. 47, *c*), which contain the spores. The asci vary from four to eight in number, nominally six; the spores also vary in number, the average being six. The Uncinula spiralis therefore appears in two phases—first as a white flocculent mold; secondly as perithecia with more or less uncilate, or spiral appendages,



The same. Cross Section. Fig. 44.

VARIATION IN HABIT.—One of the most interesting facts in connection with this fungus is that only the conidial form, known as Oidium Tuckeri, occurs, or is so far known in Europe. There is some question as to the actual specific identity of Oidium Tuckeri as found in Europe and the conidial stage of Uncinula spiralis as found in this country. The bulk of opinion is, I think, that they are identical, for while Von Thümen in his Fungi Pomicola and in his Pilze des Weinstockes, follows Fuckel in giving Sphærotheca castagnei, Lev. as a synonym of Odium Tuckeri, thus implying that this last is the conidial form of the former, Fuckel merely makes the conjecture without positive proof, and there is great improbability in the conjecture being correct. We have in fact, in this case, so far as the evidence goes, one somewhat parallel to that of the Grape-vine Phylloxera. The gall-making form of this insect upon the leaf is of very common occurrence, and the form most easily observed in America; whereas in Europe the species very rarely produces the gall. Yet the historic evidence is conclusive as to the introduction from America of Phylloxera vastatrix, and almost as conclusive as to the similar introduction of this Oidium; and to my mind, they both furnish admirable illustrations of a change of habit in an organism sufficiently marked that, without the historic evidence, the question of the exact specific identity of the parent and its transcontinental issue might well be raised. The interesting question, philosophically considered, is why, if the winter spore is necessary to the perpetuation of the Uncinula in America, the species can propagate for an indefinite period without it in Europe?

EFFECT ON THE VINE.—This fungus is less injurious to our hardier native grape-vines than to the European Vitis vinifera and hybrids of it. Hence it is more to be dreaded in California and in Europe than in the Eastern United States. It also prevails most in a dry atmosphere.

REMEDIES.

Sulphur is well known to be one of the most satisfactory remedies against this fungus, and is in universal application where the disease prevails. It is generally applied dry by means of bellows, though, it seems to me, the wet method would have advantages with the use of the cyclone nozzle. Mr. A. Vitch, of New Haven, Conn., has found that in green-houses the sulphur may be advantageously applied by mixing it with linseed oil to the consistency of paint, and brushing it on the flues or hot water pipes. Mr. Wm. Saunders, the Horticulturist of the Department of Agriculture, has for many years used, with great satisfaction, a weak solution of lime and sulphur obtained by pouring water on one-half bushel of lump lime and 10 pounds of sulphur, and then diluting for use.

THE DOWNY GRAPE-VINE MILDEW.

GENERAL APPEARANCE.—The other mildew, namely the Peronospora, shows itself on the underside of the leaves in the form of a small patch of whitish down, and sends its mycelium into the adjacent tissues, destroying the parts, which scorch and turn brown as if sun-burnt. It has been known by various popular names as "blister of the leaf," "blight" and so on. It generally escapes attention in its earlier stages and experience shows that it is most destructive where the dews are heavy, or in continued damp, rainy weather. This particular mildew is the Peronospora viticola (Berkeley & Curtis), DeBarry having first referred to it as Botrytis vitieola.

STRUCTURAL CHARACTERISTICS.—The mycelial threads or hyphæ are about .01 mm. in diameter, somewhat larger in the stems and petioles than in the leaves. They are found everywhere except in the wood proper, but particularly in the tissues of the leaves. Their contents are granular and somewhat oily, and cross partitions, so characteristic of the Uncinula, are rare. Just beneath the stomata of the leaves, the hyphæ are particularly abundant. Those which are to bear the conidia pass through the stomata and grow more rapidly than the rest, ramifying and reaching from .3 to .6 mm. in hight (Fig 48 *a* p. 74), and bearing the conidia on the tips of the branchlets. The conidia are oval and obtuse, varying in size from .012 to .03 mm. in diameter (Fig. 48, *bb*), Germination takes place with great rapidity whenever there is sufficient moisture. Conidia placed in water become swollen and somewhat segmented in an hour. The segments become oval bodies, collect at the distal end of the conidia, rupture the wall in a short time and escape, swimming off as zöospores, each with two ciliæ (Fig. 48, *ee*). Each conidium produces, on an average, five or six zöospores, though the number is quite variable. They vary also in shape, and from .008 to .01 mm. in length. They move about from 15 to 20 minutes; then come to rest, when the cilia drops off, and a new mycelium develops from the side.

The winter spores, or öospores, are found, in September and October, in discolored and shriveled parts of leaves. They are spherical; .03 mm. in diameter, with a thick, smooth, yellow cell-wall. Fig. 48, *d*). They fall to the ground with the leaves and lie dormant till Spring.

So far as I can find the actual steps by which the winter spores are produced, have not been observed in this species, or, for that matter, in the Uncinula, but as the process is known in the order Perisporiaceæ, we may confidently assume that they result, later in the season, from the union of the contents of two cells or hyphæ, *i. e.*, they are of sexual origin.

We thus have, as in the Uncinula, both summer and winter spores. The summer spores develop outside the leaf and germinate rapidly as soon as moistened by rain or dew. Consequently, during a wet Summer, the spread of the fungus is extraordinarily rapid, so that within a few days a large vineyard

becomes infested. The winter spores are found in the interior of the dry leaves and hibernate within those of the ground. In Summer they again get on to the young leaves by the agency of animals, wind and rain.

(To be continued.)

What Others Say

LET US USE OUR FEED-STUFFS AT HOME.—Some time since, Mr. Moreton Frewen sent from the Far West to England some steers as they come from the ranges, for the purpose of having them fattened by the farmers of Great Britain. Bell's Messenger, in noticing their arrival, says that it is surprising that we Americans do not see that it must pay us better to expend $22.84 (the cost of transportation from the Plains to Liverpool) for the transportation of a $100 steer, than upon one worth only $60. It is preposterous not to feed the animal on mixed meal and hay on the spot where those foods are grown, in preference to sending the half-fatted animals to Great Britain to be there fattened on the self-same food also sent over and greatly raised in cost by the transit. There is so much truth and common sense in these remarks, that every American farmer should commit them to memory and ponder on them well. Not only are full-grown, but half-fattened animals sent forward, thus taking in the bone and muscle the largest proportion of the expensive phosphates and nitrates to the gross weight, but we are sending abroad, at a price scarcely above the cost of transportation, thousands of ship-loads of feeding stuffs rich in the very elements of plant growth for which our fields are languishing. The sooner we realize the full truth of these facts and heed them, the better for our future.

ABSORPTIVE POWER OF MILK.—Dr. Dougall of Glasgow, Scotland, has been trying some experiments to determine the absorptive power of milk, which he details in the Scottish Agricultural Gazette. He inclosed in jars a portion of milk, and in different jars but not in connection with the milk, different substances giving off flavors. At the end of eight hours a portion of the milk was carefully drawn from near the bottom of each jar, by means of a pipette so as not to disturb any other part of the milk. In every one, of 15 trials, the milk had absorbed the flavor to such an extent that it had penetrated the very lowest stratum. This shows the great importance of having all places in which milk is kept perfectly free from any bad odor even though very faint.

THE MANURIAL VALUE OF FOOD A MATTER WORTH CONSIDERING.—Sir John B. Lawes has given a table of the value of the manure made by the consumption of different foods. As determined by chemical investigation at Rothamsted, the maximum values of dung yielded from the consumption of different foods are shown in the following table in the figures opposite:

Manurial residue from one ton of	Total money value of fresh manure.
Decorticated cotton cake	$27.40
Rape cake	20.70
Linseed cake	19.03
Malt sprouts	17.16
Beans	16.08
Bran	14.17
Peas	10.06
Clover hay	9.94
Oats	7.23
Wheat	6.93
Meadow hay	6.93
Malt	6.46
Barley	6.36
Maize	6.08
Pea straw	4.65
Bean straw	4.29
Oat straw	2.81
Wheat straw	2.45
Barley straw	2.45

We have only included the feeding stuffs commonly in use in this country. Dr. Lawes estimates that of these values one-half is appropriated by the first crop, one-third of the remainder the succeeding year, and so on, each succeeding crop appropriating one-third of what remains in the soil from the preceding year. While these figures are, of course, too high for this country, they are, no doubt, comparatively correct. That is, they give the comparative value of the manure made from a ton of the several foods therein named.

EGG-LAYING PROPERTIES OF MINORCAS.—Mr. J. Physick says: "On January 1st, 1885, I placed seven Minorca hens that were hatched in May, 1884, with a stag on a grass run, with the intention of knowing what quantity and weight of eggs they would produce in 12 months. They remained there until the end April, when, for want of room for chickens, I placed them, without the stag, on a flat roof, over a small store. Dimensions of flat roof, including roosting house, 20x9 feet. Eggs taken as follows: January, 69; February, 108; March, 125; April, 102; May, 152; June, 162. I have several times weighed their eggs, and find them average 29 ounces for 12, so that these seven hens have produced in six months 122 pounds of meat, equal to 17½ pounds for each hen." This rather large hen story we find in the Scottish Agricultural Gazette. As will be seen, each hen laid an average of over 9 7-12 dozen eggs in six months, or 115 eggs in 181 days, and by weight they produced more than four times their own live weight in very rich food. Who will say that hens do not pay? What other stock can make as good a showing?

RESULTS OF STARVATION.—The National Live Stock Journal speaks of the hereditary results of starvation. The health and vigor of all animals depend upon regularity and sufficiency of the supply of nourishment. This fact is true even of wild breeds, and it becomes more and more apparent as animals are improved. An improved animal is the product of special care and is trained to require that care. To starve such an animal does not lower it to the condition of wild animals, but puts it beneath their level. Its constitution is an artificial product, and by starvation we lose all that enables us to control the form and quality of the animal. Degeneracy sets in and only death or infertility can prevent the "improved" breed from rearing a race of weeds below the scrub in form and vigor. Every man who procures an improved animal assumes a duty.

THE POOR EDITOR!—Mr. C. A. Green has the following to say of the editor who is heartily interested in his work: "Of all hard-working men, none labor so hard as a successful editor. During every working hour his burden hangs heavily; in the still hours of night his harness is not removed, but hangs like a nightmare upon him. There is no hour when his paper is dismissed from his mind. He reads to gather items for his journal. He travels to gather information. He talks with people that he may fill his pages. He has no vacation, no rest until the daisies blossom over his grave."

MULTUM IN PARVO.

THE Sharpless Strawberry will continue among the most valuable varieties for size of berry and vigor of plant. In these two respects we do not know of its equal.....

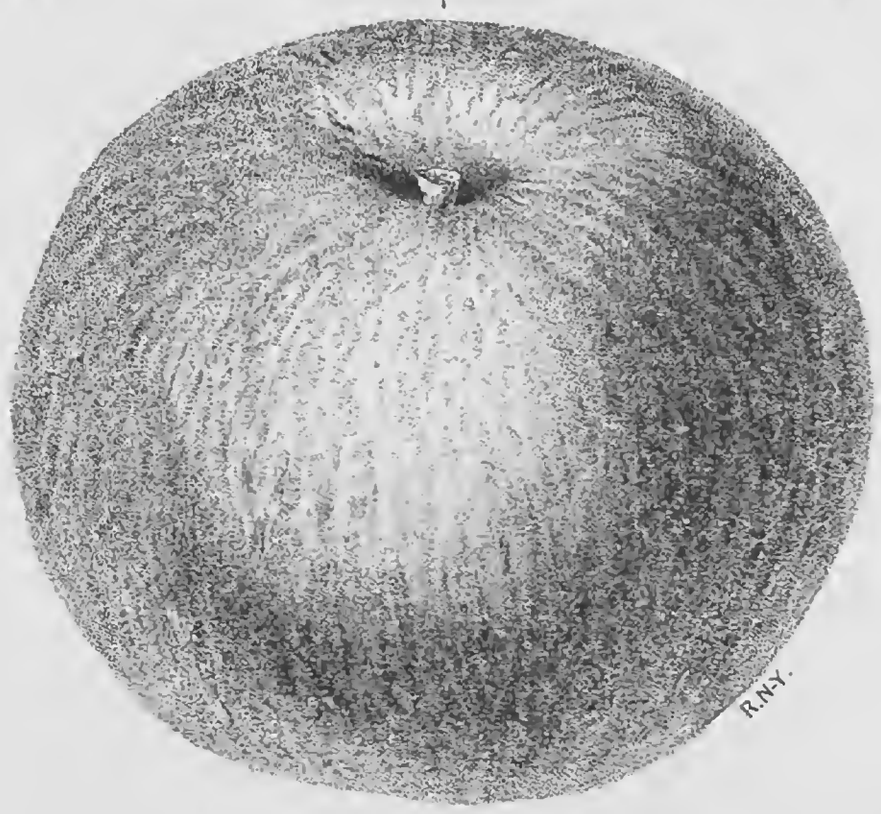
WE like the Parry for the large size and symmetry of its berry; for its quality and earliness. It gave us the finest early berries last year. The plant is fairly vigorous—flower perfect.....

THE RURAL was the first journal to praise the Cumberland Triumph Strawberry. The fruit is always shapely and of fine quality, though it is not of the firmest.....

THE Henderson is unquestionably of fine quality and goodly size. As to its productiveness and vigor, we must try it another year before a just report can be made.....

THE Jewell is the most productive strawberry ever raised at the Rural Grounds. The plants are vigorous. The quality of the berry is fair. Flowers pistillate. All should try the Jewell. We shall make an early report of its behavior next season.....

The Breeders' Gazette truly says that many a man who is wide-awake to the necessity of a reaper in the harvest field, is fast asleep to the importance of improved stock in the stable; yet one is no more important than the other..

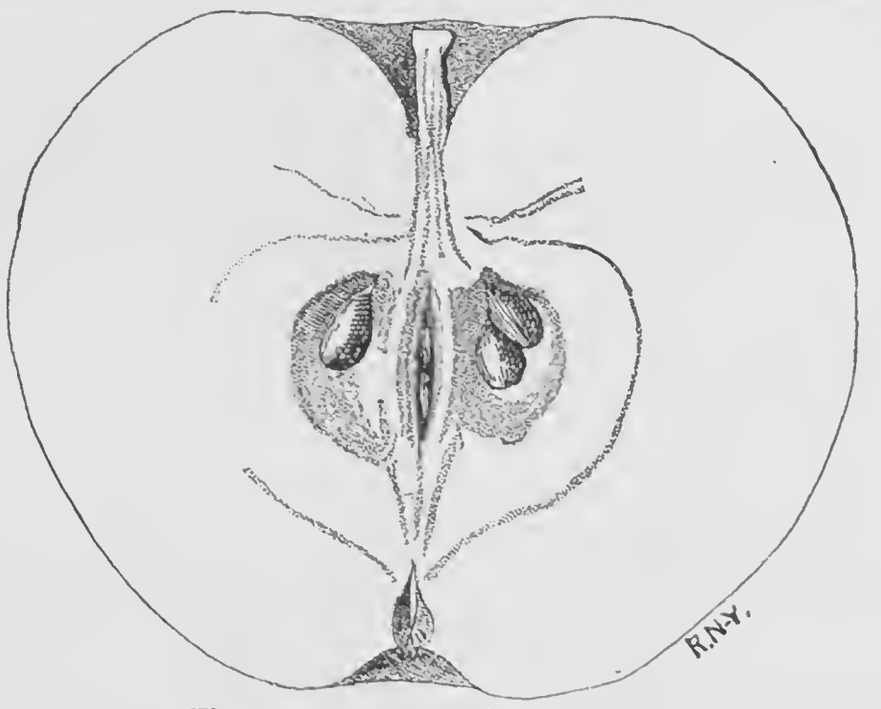


HUBBARDTON PIPPIN. From Nature. Fig. 45.

THE same paper thinks that "salt and pepper" is a better term than "marbled" in speaking of the best beef. There should be not only streaks of fat and lean, but the two should be blended in every part.....

THE good and enterprising John Thorpe speaks of the Progressive Chrysanthemum as the plant that extends the floral season for a month into late Autumn and early Winter. He mentions its other merits, as cheapness, simple culture, bright colors, hardiness, an ability to thrive in a variety of conditions, and its gay appearance when gardens are bare.....

JOSIAH HOOPES expresses the opinion in the N; Y. Tribune, that the longer he lives, the more he is convinced that very little, if any, harm is done to trees or plants by pruning in midwinter.....



The same. Cross Section. Fig. 46.

WHAT is the reason that people go on planting the same old trees and shrubs, when there are others that are far better—handsomer, hardier, longer-lived?.....

MR. LOWELL sent the following stanza to Dr. Asa Gray on the occasion of his 75th birthday:

"Just fate prolong his life well spent,
Whose indefatigable hours
Have been as gaily innocent
And fragrant as his flowers."

THE Congregationalist says that a "duck of a man" usually makes a "goose of a husband."

IT seems that it cannot be too often repeated that we do not mulch for the purpose of keeping plants or their roots *warm*, but merely to guard against the ill effects of sudden freezing and thawing.....

FROM the above cause, probably more injury is done to plants during late February, March, and even April than during any other part of the cold season.....

MOST of the catalogues thus far received announce Welcome Oats. As already stated, it has been ascertained that there are several names for this oat. Perhaps Welcome is as good as any. It is certainly one of the best varieties in cultivation.....

JOHN THORPE says, in the Floral Cabinet, that the Fall of 1886 will see chrysanthemum exhibitions far surpassing any ever held. We do not doubt it. He mentions that one horticultural society alone will offer $500 in one premium for 25 plants; $50 for 100 cut blooms, and others in the same proportion.....

THE Wine and Fruit Grower says that some may consider it a foolish proceeding to keep on testing novelties; but we take lots of comfort and pleasure in this kind of foolishness. If we like to dance we are willing to pay the fiddler.....

MR. J. T. LOVETT says of the Golden Queen that it is head and shoulders above all other yellow raspberries. He does not think it is the best market berry, or *as* a market berry superior to all red varieties. "It cannot fail to win the affections of the amateur," he says.

MR. LOVETT also asserts that the Early Harvest Blackberry is hardier than the Kittatinny. Don't mistake the Brunton for the Early Harvest.....

PROF. BROWN, an English author, in his work on "Animal Life," says that the tendency of animal life in domestication is, in his opinion, "the survival of the unfittest." He looks upon an animal as "a tub with a hole in the bottom," which must be filled by pouring into it quickly, because the more quickly you pour in the less the waste.....

To make both ends meet: Eat beef tongue and drink ox-tail soup.....

ROSE-COMB Leghorns may be preferred to Single-comb Leghorns, for the reason that the rose comb does not freeze so easily.....

THE Poultry Keeper says that the Pekin duck is the largest in size and the most easily kept within an inclosure, but the Aylesburys are the better layers on an average. The Rouens are the most beautiful and attractive, while the common puddle duck is the hardiest. The Muscovey is a large breed; its rank flavor of flesh has been an obstacle to its popularity.....

THE Orchard and Garden, after detailing many of the merits claimed for the Earhart Everbearing blackcap, concludes thus: "We cannot relate all the other good points claimed for this 'wonderful' berry, as they are drawing almost too heavily on our credulity."....

COUNTERFEITERS should be sent to the penitentiary. It makes no difference in their guilt whether they counterfeit bank notes or butter, says the Orange County Farmer.....

THE N. Y. Times says that if the owner of a 100-acre farm worth $20,000, were to sell his property for cash he could not possibly invest his money nearly so well as it was in the farm, for the interest at five per cent. on the capital would not begin to provide him with house, provisions, comforts and luxuries which he enjoyed on the farm, but never took any account of in his bookkeeping.....

"WILL the butter of the future be the product of the cow or the hog?" asks the Philadelphia Press. The hog is rooting his way ahead. Nothing will help him more than poor cows, poorly fed, poorly milked and the butter poorly made. Bad butter, though genuine, is the best aid the butterine man can hope to have. Unless the cow is sustained by the best dairy methods, she will be left in the race.....

THE Press says that "Mr. Caywood can't understand why people are not allowed to buy fruit for its beautiful appearance on the table alone. They buy flowers with no taste at all. Why decry beautiful fruit because its flavor is not the best?" Mr. Caywood may have reference to the Lawson (Comet) Pear, or possibly to the Kieffer. We would humbly answer that it is better to buy flowers for their beauty and fruits for their quality, since the one is not fit to eat while the other gives us the most delicious and healthful of foods. But Mr. Caywood overlooks the fact that the most delicious fruits are, as a rule, the most beautiful.....

IT seems to be the general opinion that the hogs, the poor cows and the slovenly farmers are doing their best to aid oleomargarine. The hogs have come to stay, but the rest of the allies must "go."....

BRO. GARDNER, of the Lime-Kiln Club, thinks little of men who try to be ruled by mottoes. He knew a man once who had "Time is money" posted in every room. He always put in his corn 10 days too early, and had to

plant potatoes 20 days late to make up. The only good crop he ever had was one raised by his wife while he was sick.....

THE American Dairyman wonders who will be first to advertise polled herds of Jerseys. It thinks the horns of this breed are already in a dilapidated condition. They grow in all directions, are soft and easily broken, and would be much better bred into the air. A polled cow is surely better looking than a "lop horn," or a cow with an ugly stub sticking up from her head.....

WE never lose information by giving it away.....

PROF. BROWN says that animals can not be fattened on roots without grain. No animals can be made to pay their keeping when fed for beef, unless the value of their manure is taken into the account. Stock husbandry is yet the chief reliance to the ordinary farmer. Roots are worth more in practice than chemical analysis indicates. The water in roots is not like the water from the pump. Enough roots should be fed to prevent cattle from drinking much water.....

CARELESSNESS in saving manure has driven more than one farmer "out West." The same carelessness, if inherited, will send his children still further towards the "setting sun," or into the factory.....

NITROGEN has often been called the lazy manurial element. It hates to enter into a combination with other substances where it would be obliged to work at farming. It is the chemical gentleman of agriculture. It floats lazily in the air, even though plants that it brushes against are dying for it. It is slow about entering work, it is like a flash in getting out of it when once it has been trapped. Any farmer who throws his barn-yard manure out into the rain will sadly testify to this latter fact.....

THE English Farm and Home says that the old English song, "The Roast Beef of Old England," was written and composed after a dinner of beef from the ten-year-old steer which had done his plowing and his harrowing, and been "fatted off" for market on the turnips he helped to cart to the homestead. Fat-stock show beef is not the best to eat, though it ought to be.....

THE Philadelphia Press has an article on "Tree Butchers," under which head it classes those who wantonly destroy forests as well as those who disfigure trees and shrubs by unskillful cutting. It is not in all respects a good name. A butcher always grows fat at his business, however savage it may be; the tree butcher will grow poorer the longer he works at his trade.....

THE U. S. Dairyman says that butter, in the granular form, may lie an hour in the brine and yet take no harm. No more salt will enter the globules than is needed. The overplus will run off. Too much salt can be ground into butter, by mechanical force, but it will not absorb any more than it needs.....

THERE is little value in a single test of milk. There are too many conditions of weather, feed, temper and treatment that affect milk to render a single test absolutely reliable.....

SCRUB cows appear to have some arrangement within them that skims the milk before it passes into the udder. It is hard to say where the cream goes to. It must be spent mostly in thickening hide and building up bone. It takes a thick hide to sell for 20 cents per pound, and ground bone is dull at two cents. The scrub cows appear to use the material, which in a thoroughbred would produce 50 pounds of 30-cent butter, in making one pound of hide or bone.....

Everywhere.

RURAL SPECIAL REPORTS.

Georgia.

MACON, Bibb Co.—The Rural seeds all did well. The corn was grown on poor, thin soil, well manured. The stalks grew from five feet to eight feet high, and bore from one to five ears. One (a yellow dent) was fit for the table in 70 days. The peas were very fine. The Rural Bi-color Tomato is of superior excellence; but I think not better than Livingston's Prolific. The beans I consider of little value either as snap or shelled. The Garden Treasures were very pretty. D. M.

Indiana.

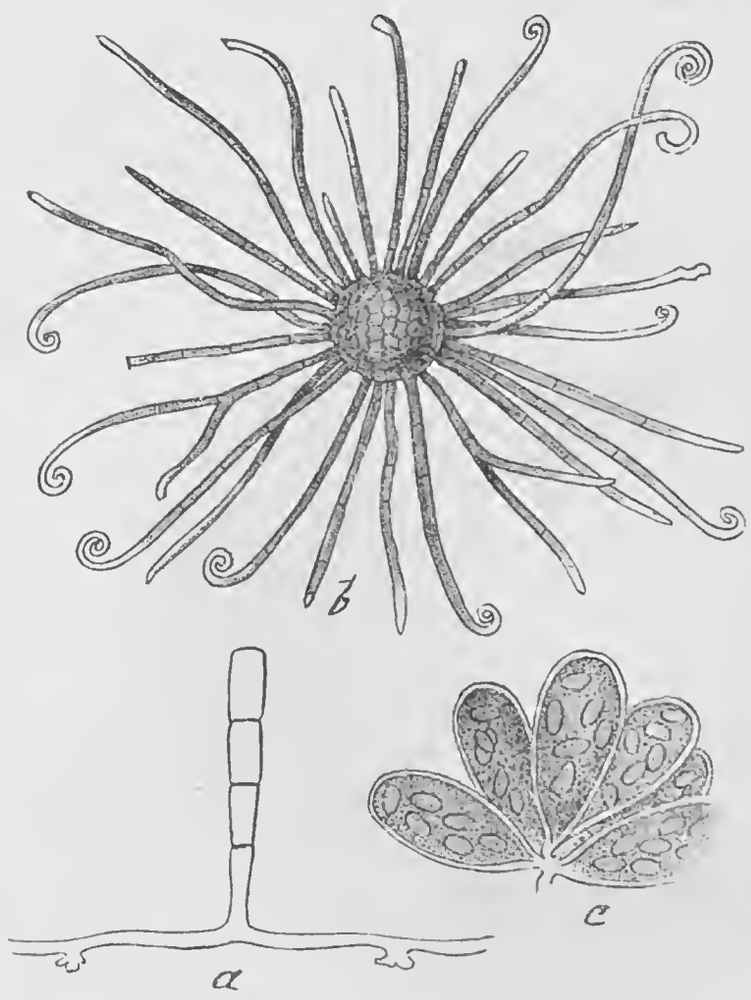
MONTPELIER, Blackford Co., Jan. 14.—My Diehl-Mediterranean Wheat was splendid; and my Thousand-fold Rye was also good. The Green Flageolet Bean yields well. The tomatoes were not so good as the ones produced from seed of the year before. The peas did well. The Johnson Grass I did not plant. The corn amounted to nothing. P. L. E.

Kansas.

MICHIGAN VALLEY, Osage Co.—The Rural Corn did well. I intend planting the best of it again. The peas and beans were very fine. The tomatoes did not do well, as the weather was wet; they grew all to vines and no fruit. The Johnson Grass did not come up. The Garden Treasures were particularly fine. I had an endless variety of beautiful and choice flowers, and many perennials. We are all flower lovers at this ranch. D. J.

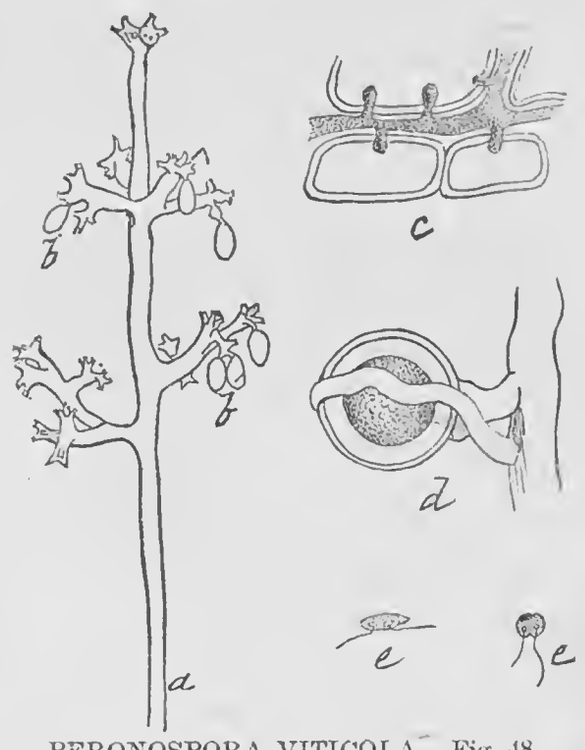
New Jersey.

MANALAPAN, Monmouth Co.—Some of the Rural seeds have been quite valuable to me, among which are the the Mold's Ennobled Oats and the Blush Potato. Some kinds of



UNCINULA SPIRALIS. Fig. 47. (See page 72.)

a, Conidia and Mycelium; *b*, Perithecium, with appendages; *c*, Asci and Spores.—*After Farlow.*



PERONOSPORA VITICOLA. Fig. 48. (See page 72.)

a, Mycelium, with Conidia (*b b*); *c*, Haustoria; *d* oospore; *e*, zoospores.—*After Farlow.*

corn also grew well, as did the Cuthbert Raspberry and the R. N.-Y. Pea. The Blush made a much better crop than any potato I grew this year. The beetles ate them but little, and the grub-worm did but little damage. The R. N.-Y. Pea bears well and ripens early.

W. H. DU B.

New York.

STAPLETON, Richmond Co.—All the RURAL seeds did well. The corn was interesting, some stalks having four ears (not large, however), a large number having three, and more two. Of these last, some were splendid and on almost all that bore only one ear, that was excellent. The peas and beans did well. I like the Rural Union Corn the best. The flowers were appreciated very highly. In fact, all seeds from the RURAL are considered, by me at least, worthy of a careful trial. W. E. S.

North Carolina.

HENDERSON, Vance Co., Jan. 11.—We read a great deal in the papers of the great prosperity of the South during the year 1885, which may all be true of the section as a whole, but it is not so of this portion of it. Our crops of all kinds were light. Cotton, on which we depend considerably as a money crop, was not more than two-thirds of an average, and, besides, the price is so low as to barely pay the cost of production when up to a full average. This condition of things causes inability on the part of tenant farmers to pay their rent, which in many cases entails a dead loss to the landlord, especially where the renter deems it cheaper to move than remain another year, and try to pay up old scores. Tobacco planters have done somewhat better for many years past; yet mixed farming would be much safer and more profitable, as has been demonstrated by all those who can be induced to practice it. The prices in our home market are:—Wheat, good, $1.25; corn, 80 cents; cotton, 8¼ cents; sweet potatoes, 75 cents; Irish do., $1 to $1.25; hay, in bale, $20 to $25; eggs, 20 cents; butter, prime, 30 cents. Until January 4, we had a delightful Fall and Winter—no cold weather or severe storms to interrupt farm work. Roads good, and but little fuel required for comfort. Stock came into the New Year in better condition than usual, which is fortunate, owing to our light forage. A heavy rain on the 4th was followed by cooler weather until the 8th, when snow and sleet covered the ground, the weather growing colder until this morning when the mercury went to 2° above zero, with indications of milder weather. M. B. P.

Pennsylvania.

SHOUSETOWN, Allegheny Co.—I cannot do without the RURAL. I value the Seed Distribution highly. The D-M. Wheat I think good. The 50 different kinds of corn were no use here. The Rural Union Dent sent out in 1884, is fine; it yielded one-third more than the Leaming on the same ground. J. C. B.

WINTERBURN, Clearfield Co.—In summing up the year's operations in agriculture in this county, the general condition is that the farmers have been liberally rewarded for their labor, although prices of produce are not the best. Crops were good and are remunerative at present figures. Winter commenced early here, and we had several weeks of good sleighing, but it turned warm on the 20th, taking off the snow, and we have had no sleighing since. H. F. S.

NORTH PINE GROVE, Clarion Co.—Both varieties of Rural Peas did well. The Flageolet Beans all grew well, ripened early and yielded well. The Johnson Grass did not come up. The 50 crosses of corn all came up nicely and grew well from five to twelve feet high, and had one to five ears on a stalk; but none ripened really well. The King Humbert Tomatoes were fine. The Garden Treasures gave us a choice selection of very fine flowers all Summer and Fall. We had a very fair crop of hay; wheat was one-half a crop, oats a full crop; potatoes, poor and badly rotted; apples the largest crop we ever had and of the best quality. Buckwheat a fair crop. Prices of all farm products are low. Success to the RURAL! A. B.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time.]

ANGORA GOATS; SCABIES OR PRURIGO IN A HORSE, ETC.

K. C., San Juan, Cal.—1. Where can I get a full-blood Angora "billy goat?" 2. How long does a female of that breed carry her young? 3. One of my horses bites and scratches himself until he is covered with sores; what ails him? 4. What is a good washing machine? 5. What is the best potato digger?

ANS.—Large numbers of these goats are profitably kept in the mountainous parts of Southern California; but we do not know who has them for sale in that State. They can be obtained from Robert W. Scott, Frankfort, Ky., or Richard Peters, Atlanta, Ga., the oldest breeder and importer in the United States. They are worth about $50 per pair. 2. Five months, or about 150 days. 3. The irritation of the skin, causing the horse to rub and bite himself, is due either to scabies (also called mange, itch, scab, etc.), or prurigo. The former is a disease of the skin caused by the presence of acari or the itch parasite, while the latter is a nervous irritation of the skin, most commonly due to disordered digestion or unwholesome surroundings. For scabies, examine the skin very carefully for the presence small scabs or crusts. Remove a few of the crusts, brush them up over a sheet of white paper and watch very closely (preferably with a magnifying glass), for any movement among the fine particles. It may be necessary to examine several crusts before one will be found in which the minute parasites may be seen. When their presence becomes known, the treatment is quite simple, but to be entirely successful it must be very thorough. Wash the animal thoroughly with warm, strong, soft soap suds and a stiff brush, to break up and remove all the crusts. Then apply a decoction of tobacco made by boiling one pound of good leaf tobacco in 12 quarts of water. Repeat the application on the third and sixth days if necessary, after washing with the soap suds as before. It will also be necessary to treat the woodwork of the stable, harness, saddles and all grooming utensils to a similar thorough cleaning and the application of the tobacco liquor or a strong solution of caustic potash. Blankets and other clothing may be boiled for a few hours in strong soap suds. If fowls are allowed the run of the buildings, and especially if their roost is in close proximity to the stables, it would be well to whitewash the walls of the stables and roost with freshly slacked quick-lime. Clean, dry, airy buildings are very important auxiliaries in the prevention of scabies. For prurigo, which is to be suspected in the absence of any parasites, give a purgative—four to six drams of Barbadoes aloes, according to the size of the animal—and put on a strict laxative diet. Bathe the skin, when irritated, with a mixture of two drams of liquor of potash, and one dram of hydrocyanic acid, in one quart of water. Internally give, night and morning, four drams of bicarbonate of soda and two or three grains of arsenic, to be given in solution and continued for one or two weeks, or until the irritation ceases. 4. The Keystone and Walker machines, for sale by Frank Adams, Erie, Pa., are both good. 5. The Harrington Potato Digger, made by the Planters' Hoe Co., Troy, N. Y., is as good as any.

ACTION OF GYPSUM ON LEGUMINOUS PLANTS.

R. H., Montreal, Prov. of Quebec, Can.—In this Province, sulphate of lime (called here land-plaster) is largely used as an application for field peas, being sown broadcast *on the foliage* while still wet with dew, after the plants are three or four inches high. In a few days, the effect is evident from the increased greenness. What is the action that takes place? Does the sulphate draw ammonia which is then absorbed by the leaves?

ANSWERED BY PROF. S. W. JOHNSON.

It is an old observation that gypsum sprinkled on the leaves of leguminous plants when wet, appears to deepen their green color, and to give them a look of increased health and vigor. Whether the same result would follow a similar sprinkling in the absence of dew, or if an equal dose of the sulphate were applied directly to the soil, or, finally, if there were no application whatever, has not, to my knowledge, been the subject of comparative experiments. If we take it for granted that sulphate of lime, sprinkled on the leaves of peas when wet with dew, really causes them to take on a deeper green color, I can offer no satisfactory explantion of such an effect. The sulphate of lime can scarcely act by drawing ammonia, for the reason that air and dew contain very little ammonia to be drawn. A million parts of air contain, by the most liberal estimates, but two parts of ammonia. Boussingault found in a million of dew but four to six parts of ammonia. It is accordingly difficult to see how plaster can visibly affect vegetation by collecting ammonia from these sources. If there be a real effect, it is most likely the result of the solution of the sulphate of lime itself in the dew, and its absorbtion by the leaf. But even here considerable difficulties are in the way. It is a fact that dew condensed from the air by a fall of temperature, rests in globular drops on the leaf hairs, having very little contact with the leaf, and probably evaporates away for the most part, without wetting or being at all absorbed by the foliage, whose surface is, in fact, so slightly adapted to absorbtion that, as Duchastre has demonstrated, a healthy plant continuously loses weight, by loss of water, when exposed for hours to rain, if that rain is allowed to fall on its leaves only, and is debarred access to the soil.

Again, in accord with the above facts, is the observation that much of the dew seen on foliage in the morning after a cool night is water exuded from the leaves and not water condensed from the air, the natural course of the water of vegetation being in at the roots and out at the leaves. It would, therefore, appear highly probably that the increased greenness noticed a few days after the sprinkling of plaster, is either not the effect of the sulphate of lime at all, or is the effect of it after it has mostly fallen to the ground and

acted on the plant through the roots. I am inclined to think that in most cases the increased greenness follows altogether independently of the sulphate of lime, as I have frequently observed that young plants, especially Indian corn, often appear yellow for a week or so when a few inches high, but shortly afterwards assume a deep, healthy green without any application whatever.

The young plant is at first nourished almost exclusively from the seed. It may easily happen that the cotyledons are nearly exhausted before the rootlets have struck deeply enough to draw adequate nutriment from the soil, and the plant may suffer temporarily during the weaning process, but quickly recovers when its root-tips reach a depth that insures suitable and regular supplies of moisture and plant-food, and protects them from too great fluctuations of temperature.

GRAPE QUERIES.

H. K. Onawa, Ia.—1. Would pigs pastured in a plum orchard destory the curculio? 2. When should plums be grafted? 3. What is the standing of the Duroc-Jersey among breeders? 4. Can grape-vines be grafted with success, and when? 5. What is the advantage of bagging grapes, and what kind of bags are used, and when should it be done? 6. How are grapes hybridized?

ANS.—1. They would have no immediate effect, but would help to diminish future numbers were there no trees outside of the pig yard in which the curculio could breed. The best and cheapest way to rid the plums of these pests is to jar the trees, catching the "bugs" on canvas sheets, and destroying them. 2. Plums should be grafted as soon as the first warm days of Spring come; though if the cions are well kept, the work may be done later with fair success. 3. They have many friends, though most people regard them as too large and late-maturing. 4. Yes, at any time before the buds swell much. It is best done by what is called the Wagener method. This consists in sawing and cutting out a small piece of the stock, so that when the cion is cut on three sides, so as to make it a little wedging, it is crowded tightly into the kerf, the whole then being buried. It is hard to describe this method without cuts. If you can find a file of last year's RURAL, it is fully illustrated on page 259. 5. The advantages of bagging-grapes are that it prevents the lodgement of the rot or mildew "spores" on the fruit, and thus saves it from disease. It should be done early—as soon as the grapes are fully out of bloom. The bags are what grocers call one and two-pound bags. They are made of thin manilla paper. In putting them on, the lower corner of the bag is cut off so as to let any water that might enter escape. The bag is slipped over the cluster, up over the cane and pinned. 7. The petals of the unopened flowers of the plant used as female are carefully opened; the stamens, or male organs, are cut out and the clusters covered with fine muslin. In a day or two the clusters are uncovered and dusted with the pollen of the plant used as male, and the clusters are again covered with the muslin. It is well to repeat this operation again the following day

ABSCESS IN BULL'S NAVEL.

J. C. S., Holbur, Ia.—About three months ago a swelling, the size of an egg, appeared in the navel of my eight-months-old bull calf. It soon opened and for some time discharged pus; then disappeared, and finally the sore healed. Three weeks ago the swelling reappeared in one night, as large as a man's fist. A blistering salve was applied, and within a week it opened and discharged a lot of matter. Now the swelling has again all disappeared, but there is a small hole from which a quantity of thick, yellow pus is discharged. What should be done?

ANS.—There is evidently an abscess due to some unknown cause, or, possibly, the navel has never perfectly healed. If the opening is large enough to admit the finger, carefully explore the cavity from which the pus flows and endeavor to reach the bottom of the abscess. If this can be done, wash out daily with some weak astringent antiseptic solution, as one-half dram of zinc chloride in a quart of water, or, if the opening is small and the bottom cannot be reached, use a common syringe to throw the solution into the opening.

TENDER FEET IN A HORSE.

"*Subscriber*," *Moore's Forks, N. Y.*—For three years my seven-year-old roadster has been lame at times in the right fore-leg and left hind-feet. The wall of the hoof is thin. Long, hard drives and heavy pulling, or standing in the stable do not make his limbs tender or swell them; but he is often lame when first hitched up; what ails him?

ANS.—Unless the difficulty or tenderness can be more definitely located a satisfactory answer cannot be given. It may be that the animal is constitutionally week in his limbs, and all that is necessary is careful usage. A competent veterinary surgeon by a personal examination of the horse would probably be able to locate the difficulty and prescribe a proper course of treatment if such is necessary.

FODDER QUERIES.

J. D. J., St. Thomas, Florida.—1. We can raise only about 10 bushels of corn per acre, while we can buy it at the railroad station for 85 cents. Would it not be better to buy it, raising some sort of fodder crop? Timothy hay costs $1.75 per hundred pounds. 2. What is the best plant for me to use for soiling and curing for fodder? 3. Would it not pay to plant artichokes, chufas and sweet potatoes for hogs, letting them root them out? 4. What is the best breed of hogs to use for crossing on our long-nosed pigs for making pork for home use? 5. Where can chufas be procured?

ANS.—1. Ten bushels at 85 cents would be $8.50 per acre. You should be able to tell whether any other crop will pay better. It would seem to us that some other crop would give more clear money; if so then it would pay to buy the corn. 2. Try the Rural Branching Sorghum or Millo Maize; also try corn sowed thickly for fodder; also try the cow-peas in a small way. 3. No one can tell you half so well as a trial on a small scale, although we doubt the practicability of this plan. Artichokes have been tried for this purpose North, but have not been a success. 4. Either Essex, Small Yorkshires or Berkshires. 5 Try P. J. Berekmans, Augusta, Ga., or W. B. Jones, Herndon, Ga,

RING-WORM OR MANGE IN A CAT.

F. M. B. B., Buffalo, N. Y.—1. What is a cure for mange in a cat? The symptoms are a humor or sore on the head, which is inclined to spread, and has closed her eyes and made the hair fall out.

ANS.—The symptoms given would indicate ring-worm rather than mange, a baldness and eruption most commonly about the face, caused by a vegetable parasite—Trichophyton tonsurans—living within the hair follicles and bulbs. As a test, apply a little chloroform to the hairs about the affected part, and if it is ring-worm, the diseased hairs will be bleached while the sound ones will not be changed. The diseased hairs will also be found to be split, broken, and bristly, and the microscope will show the presence of the spores of the parasite. The treatment is very simple. Pull or shave the hair from the part affected and paint thoroughly with tincture of iodine. In the absence of the above symptoms, treat for mange. Apply a dressing made of oil of tar one part and sweet or castor oil 25 parts. Two or three applications may be necessary.

COUGH IN A COW.

R. M. C., Portland, Ohio.—Last April one of my cows aborted and didn't clean well. Soon afterward she commenced to cough in a low subdued way and did so considerably for ten or twelve weeks. The cough then abated but lately it is as bad as ever. She looks and eats well; what can be done for her?

ANS.—Unless the bowels are already laxative, give one pound of Glauber salts with two ounces of ginger. Then take one dram of solid extract of belladonna, and four drams of saltpeter, mix with a sirup or honey to form a thick paste, and smear upon the back teeth to be swallowed leisurely. Repeat twice daily. Apply a mild blister over the region of the throat—ammonia one part, sweet oil two parts. Steam the nostrils every evening by feeding a hot bran mash made by pouring boiling water over four quarts of wheat bran, and let the animal eat from the bucket while cooling.

Miscellaneous.

C. S. N., Lamartine, Wis.—What is the ratio between the fattening values of corn and barley?

ANS.—The fattening value of a grain depends almost entirely upon its free oil or fat, and its carbohydrates (the sugar, starch, gums, etc). One per cent. of oil is reckoned as equivalent to about 2.4 per cent. carbohydrates. At these rates 68 pounds of corn are equal to 78 pounds of barley. Dr. Wolff, in his tables, gives their values of 147 pounds of corn as equal to 175 pounds of barley; but in these figures he includes the value of the albuminoids which are considerably in favor of the barley.

L. C. B., Bora, no State named.—Cook's Manual of the Apiary is the best work on bee-keeping; price $1. To be had from Prof. A. J. Cook, Agricultural College, Lansing, Mich.

DISCUSSION.

W. H. H. J., HONOKUS, N. J.—I wish to note my decided objection to the plan of hen roost by Mr. L. D. Wood, illustrated in the RURAL of January 2. Any plan that permits the fowls to spend a night in such close proximity to the fresh droppings, breathing the gases which are constantly being thrown off, must be dangerous to health: nor do I advocate the low roosts used by many poultrymen. The natural instinct of the fowl is to roost high, out of dampness and foul air. Build the roosts not less than 3½ to 4 feet from the floor and have easy steps or ladders for the birds to go up and down. Cover the floor with about six inches of sand sieved through a quarter-inch-mesh sieve, so that it will be free from stones larger than peas. Every morning rake up the manure with a fine-tooth iron rake and remove it to the manure shed. This will keep the poultry house always sweet and clean. The sand can be renewed when necessary, but it should always be dry when put in.

R. N.-Y.—We do not wish to take the lance in defence of Mr. Wood. He is able to defend himself. We only wish to remark that while we are in favor of having the roosts at least above the middle of the house, we do think there should be a floor under them and not more than one foot away. With the improved and heavy breeds the danger of injury by falling from the roosts is worth considering, and the floor effectually prevents this.

G. H., PENFIELD, N. Y.—This cold Winter weather I have been studying the RURAL'S Special Fertilizer Number, which I had laid away for reference. From the study of that, combined with my own observation and experience, I confess I have become rather mixed on the question. Several contributors to the Special agree that more benefit is derived from the use of commercial fertilizers on clay than on light soil: but they do not touch on the question whether there are not some soils upon which commercial fertilizers are of no benefit whatever. That has been my experience after testing them for a number of years, and my soil cannot be called either light or sandy. I have used several standard brands of superphosphate which should be complete fertilizers, as they contain phosphoric acid, potash and nitrogen. They are considered very valuable in this immediate vicinity by farmers who use them upon what is here called "phosphate land"—that is land inclined to be moist, and nearly always beech and maple land, also black or peaty and clay soils. Did you ever know of commercial fertilizers benefiting a crop raised upon limestone land, upon which the natural timber was oak and chestnut? If so, what were the situation of the land, the fertilizers used, the amount per acre, the crop raised, the yield per acre, and was the increase in yield sufficient to pay for the fertilizer? If complete fertilizer is of no benefit on this soil, would you advise me to try phosphoric acid alone, potash alone, and nitrogen alone, and combinations of two of these constituents with the third left out? If so, what shall I buy to get the phosphoric acid in the best and cheapest form? What for potash, and what for nitrogen? My soil is neither light, porous, sandy nor leachy, the only soils mentioned as those upon which phosphate is of little or no benefit.

R. N.-Y.—A superphosphate is *not* a complete fertilizer. It contains only phosphoric acid. Your land may need one, two or all. This can be ascertained *only* by trying them separately and in their several combinations. Our friend may rest assured of one thing, viz., that commercial fertilizers will increase the crop if the soil is not already abundantly supplied with plant food, no matter whether the land is limestone or not: no matter what trees grow upon it. Bone flour is best for phosphoric acid—muriate or sulphate of potash or wood ashes for potash; blood, nitrate of soda or sulphate of ammonia for nitrogen. We have seen barley growing upon lands of gravelly limestone character, whereon a complete fertilizer had been used, strips the width of the drill being occasionally left without, and the difference between the fertilized and unfertilized parts was at least fourfold in favor of the manured. We did not see the grain harvested and thrashed, and so cannot tell whether the fertilizer was paid for by the increased crop, but we have no doubt of it. We have seen equally as favorable results with wheat and other crops, and yet the only safe way is for every man to test these manures for himself.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, January 23, 1886.

Miscellaneous Advertising.

SAVE Your POSTS and use SHAW'S WIRE FENCE TIGHTENER. Can be adjusted to any wooden post; can tighten or slacken, according to climate, with an ordinary monkey wrench. Price $8 per doz. For full particulars, apply to
W. SHAW,
Delaware, Ontario, Canada.
Agents wanted. Patent applied for.

HOW TO CATCH THE FOX. By an old Trapper. Directions, $1. Address
W. S CURRIER, Bagley, N. H.

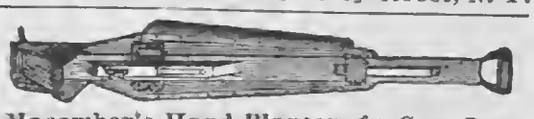
SITUATION WANTED, by a man who thoroughly understands Farming in all its branches. Age 35. Sober, industrious, and a worker. Can refer to Editor of R. N.-Y. Address "FARMER," River Edge, Bergen Co., N. J.

Farmers and Horsemen will find it to their advantage to send for new 64-page Catalogue and Price List of heavy and light, single and double Harness, made of the best oak leather, all hand work, at wholesale prices to the consumer. KING & CO., OWEGO, N.Y.

CAN'T BE BEAT!

THE "STANDARD"
WIRE NETTING
POULTRY FENCE.

Only One Cent per Square Foot, for 2-inch Mesh, No. 19 Wire.
IN BALES OF 150 LINEAL FEET.
Hatchers, Brooders, Poultry Houses, etc. Supplies of all kinds for the Poultry Yard, Dog Kennel, and Garden. Write for Circular.
Brockner & Evans,
(Formerly 422 West St.) 28 Vesey Street, N. Y.



Macomber's Hand Planter, *for Corn, Beans, and Beet Seed.* The BEST in the world. Money refunded if it does not prove satisfactory, after a fair trial. Agents wanted. Send for circular and terms.
S. M. Macomber & Co., M'f'g's, Grand Isle, Vt.

MATTHEWS' SEED DRILL.
Hand Cultivator, Wheel Hoe,
SINGLE OR COMBINED.

Admitted by leading Seedsmen and Market Gardeners everywhere to be the most perfect and reliable implements in use for planting and cultivating garden crops. *Beware of cheap Imitations!* Inquire for the genuine machines which are made only by
T. B. EVERETT & CO., Boston, Mass
Send for circulars giving latest prices and improvements

EXTRACTED
HONEY.
At 10 cts. per lb., in kegs of 50 and 100 lbs. Samples by mail, 10 cents. Address W. Z. HUTCHINSON,
Rogersville, Genesee Co., Mich.

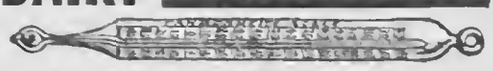
PURE MILK.

WARREN MILK BOTTLES
Patented March 23d, 1880.
Adapted for the Delivery of Milk in all Cities and Towns.
A Long Needed Want at last Supplied.
DESCRIPTIVE CIRCULARS ON APPLICATION.
A. V. WHITEMAN, R. N.
72 Murray St., NEW YORK.

TELEPHONES SOLD.

Don't pay exorbitant rental fees to the Bell Telephone Monopoly to use their Telephones on lines less than two miles in length. A few months' rental buys a first-class Telephone that is no infringement, and works splendid on lines for private use on any kind of wire, and works good in stormy weather. It makes homes pleasant; annihilates time; prevents burglaries, saves many steps, and is just what every business man and farmer should have to connect stores, houses, depots, factories, colleges, etc., etc. The only practicable and reliable Telephone that is sold outright and warranted to work.
Chance for agents. No previous experience required. Circulars free. WM. L. NORTON, Buffalo N.Y.

DAIRY THERMOMETERS!



All Glass. Easily kept clean. Tells you when to Churn, Scald, etc. **50c.**

E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, JANUARY 30, 1886.

IF the number on your address label is 1879, your subscription expires with this number; if 1880, next week; 1881, in two weeks, etc.

THE chrysanthemum illustrations in this issue are faithful drawings made from flowers sent to this office by Mr. John Thorpe, of East Hinsdale, Long Island, N. Y.

WE have always been troubled in preserving our celery in trenches. Last Fall it was taken up with all the soil that would adhere to the roots, and it is keeping better than ever before.

IT may be well that we should again remind our readers that chrysanthemums may be very easily grown from seed. Sow them now and most of the seedlings will bloom next Fall. The plants do not seed in this climate, but seeds are offered in some of the catalogues we are noticing.

THE considerable space devoted to the chrysanthemum in this number may not please all of our farmer readers, but we trust their wives and children may be pleased. We consider floriculture a legitimate and very important adjunct to the farm. A farm-home without flowers is deprived of one of its most captivating charms.

OUR subscribers are respectfully solicited to renew as soon as, or before their subscriptions expire, since, owing to the fact that our calls for specimen copies are far greater than in any preceding year, we can not supply back numbers later than the tenth of February, probably.

MR. WILLIAM FALCONER kindly sent us some fruit of the comparatively new shrub Xanthoceras sorbifolia. The seeds were planted and sprouted in a few days. The seedlings are doing well. This shrub belongs to the same family as the horse-chestnut, and bears its flowers in similar racemes. It was first illustrated in the R. N.-Y. about 10 years ago. It is now offered by several nurserymen. We shall have occasion to refer to it again ere long.

THERE is no fruit, grain, root or vegetable that will do well everywhere, while most of the new seeds, fruits or plants will thrive in *certain* localities. How then are we to secure improved varieties except by experiment? We may say that the Concord is the grape for the million. But there are many places where an Eldorado, Jefferson, Lady Washington, Brighton may yield better fruit and more of it. We may speak of the Clawson or Fultz Wheat as succeeding over a wider range of country than any other; but in many parts of the country the Armstrong (Landreth), or Diehl-Mediterranean may yield more and give a far better quality of flour. The same may be said as to other cereals, fruits, potatoes, etc. If we would increase the quality or quantity of our farm products, we *must test new things*. Let this be done in ever so small a way, only so that the results may guide us in our future selections.

ABOUT the middle of December, we received a basket of Concord grapes from Mr. C. M. Hovey, raised in Fitchburg, Mass. They were in fine order, and very good in quality to those who like the Concord flavor. In sending them Mr. Hovey called our attention to an enterprise started some time since by him to give Mr. Bull, the originator of the Concord, some testimonial in recognition of his great services to the American people in originating the Concord. We think this a worthy thing to do, and that there are thousands everywhere who would like to contribute a mite toward the memento. Mr. Hovey informs us that the names of the subscribers, together with valuable letters from the successful cultivators of the Concord in Massachusetts and New Hampshire, will be published and sent to all who care to contribute toward so worthy an enterprise. We hope hundreds will help in this matter, and subscriptions may be sent directly to Mr. C. M. Hovey, Boston, Mass., or to the RURAL NEW-YORKER, and we will see that they are forwarded. Already the leading cultivators and amateurs and dealers in grapes around Boston have liberally contributed.

NEARLY two years ago we strongly urged the convenience and, indeed, importance of a uniform standard of grain measure for all parts of the country, and suggested the cental system, current on the Pacific Coast and in Liverpool, as the best. The National Board of Trade, now in session at Washington, has just adopted our recommendation, by urging upon Congress the passage of a law providing for the measure we approved; but advising that it should be made an international standard, especially for such countries as export or import wheat. Congress can at once enact a law providing for the proposed amendment within our own borders, where the contents of a bushel vary in weight in different States; but it can only recommend to other countries the adoption of an international standard. Negotiations to effect this must be slow. We want a speedy improvement. Then our advice to others in favor of an international standard will carry more weight, when we have ourselves put it in practice by establishing a uniform standard at home.

POSITIVELY.

INTENDING advertising patrons would save us and themselves trouble in the way of correspondence, if they would *accept* our published rates as absolutely *invariable*. The RURAL'S price is 30 cents a line, unless 1,000 lines are engaged and used within a year from the first insertion. *Then* the price is 25 cents. Now we will not even consider, any deviation from those prices, no matter how large the proposed contract may be.

A COMMENDABLE MOVE.

A STATE Farmers' Institute has been called at Ithaca, N. Y., to be held February 16, 17 and 18th. We are not yet in receipt of the programme, but we are assured it will be one of deep interest to the farmers of the Empire State. We hope every farmer who can possibly do so, will make it a point to be in attendance. Set in motion the ball that should never stop till we have some Body in this State with authority to hold, not a single Institute each year, but a score or more. Reduced rates are assured on all railroads, and we hope to see a rousing turnout. For further particulars write to Prof. I. P. Roberts, Ithaca, N. Y. We shall have more to say about this later.

TO NEW FRIENDS.

OUR seed distribution for 1886 (now soon to be mailed) will contain the following quantities of seed:

Angel of Midnight Corn, from 80 to 85 kernels.
Alaska Pea, 200 seeds.
Mixed Water-Melons, 50 to 60 seeds.
Hackensack Muskmelons, 50 to 60 seeds.
Bird Cantaloupe, 15 to 20 seeds.
Garden Treasures, about one-eight of an ounce.

Multiplying these figures by 20,000, some idea of the entire cost of the distribution may be arrived at. Then $1,000 for postage, and also the cost of seed envelopes, putting up the seeds and sending them off must be added.

It has *never* been the design of these seed distributions to furnish seeds in *quantity*. We leave that to the seedsmen. Our object is to enable our readers to test the latest and most promising novelties without incurring any expense beyond that of planting and cultivation.

WE WANT

a large number of sketches for 1886 from our readers, for which we propose to pay our regular price for such matter, as the illustrations *appear* in these columns. It matters not how rudely the sketches are drawn, if only our artist can understand them and the descriptions which accompany them. The sketches desired are those of *any* contrivance whatever which will save labor or promote economy or comfort, whether for man or beast. For the farm, garden, orchard; for the barn, stable, shed, corn-crib, carriage house, tool-house, granary; for the pig-pen, poultry yard, poultry house, chicken coop; for the sheep, cattle, swine; for the house, kitchen, laundry; for wells, pumps, well-houses, ice-houses, we want sketches for illustrations. We want sketches and plans of farm houses, dairy houses, and all sorts of farm buildings; of every sort of tool or implement used in country life; of anything, in short, which may help in any way the farmer, the farmer's wife or children, and all who work the soil either for pleasure or profit. Go to your neighbors and see if they cannot help you; see if they have nothing upon their premises which you would like, and which you think would be worthy of being illustrated in the RURAL NEW-YORKER. We do not ask or expect artistic sketches or good writing. We only ask for legible writing and for sketches which may readily be understood. Photographs of any of the above will be acceptable.

IMPORTANT.

OUR REGULAR premium-list offers liberal pay certainly to all who will assist in increasing the RURAL'S circulation for 1886. It would seem, however, as if all neglected our

$3,300

worth of presents for the largest clubs, regardless of their size, for the reason, apparently, that all seem to *take it for granted* that *others will secure these presents*, and so they prefer to work for the regular premiums, which, though more liberal than ever before, will not pay half as well as would these presents. It seems probable, therefore, that for 1886—the same as last year—this list of sterling presents will be so neglected that they will be awarded, in many cases, for numbers of subscribers which, at $2.00 each, will amount to less than the *actual cost of the articles to be presented*, while many will not be awarded at all. The list of presents referred to will be found in our issue of November 14, last, and is worth looking at.

MANUFACTURERS, BEWARE!

THE Ohio Wool Growers' Association at its recent session petitioned Congress to restore the tariff on wools fixed by the Act of 1867, and appointed a committee "to go to Washington and importune Congress." Yes, that's what the agriculturists of the Nation, constituting half its industrial population, are accustomed to do when seeking State or National legislation in behalf of their special interests—they have to "*importune*" the lawyers, manufacturers, merchants and bankers who constitute nine-tenths of the State and National Legislatures. Well, "who will be free, himself must strike the blow." Just in the same way, the farmers of the country, the best and far away the most multitudinous part of its population, must "importune," a handful of people in other limited callings for their rights until they assert their own importance and dignity. And, then, what a howl goes up from the editorial sanctums of all the political papers at the supreme selfishness, imbecility and impudence of the sheep-raisers of the country in seeking a protective duty on wool, while it is to the interest of all other wearers of woolen clothes that the price should be low! Even the papers that favor a heavy protective tariff join in the outcry. They want no protection for raw materials—the products of the farm. Protection for the manufacturers is all they care for; and the manufacturers of woolens are benefited by a low duty on imported wool. The farmers of the nation are out of pocket millions and millions of dollars every year on account of the higher prices they have to pay for goods, owing to the heavy duties on foreign wares for the protection of the manufacturers of the country. At the National Farmers' Convention lately held at Boston, it was resolved that while it abstained for the present from advocating free trade or protection, it insisted that while farmers had to pay millions annually for the "protection" of manufacturers, it was only just that their own interests should likewise be protected in the few cases where "protection" is possible. The wool-growing interest is the most important of the "few." It will be a "cold day" for the "protectionists" when the mighty mass of farmers become "free-traders."

WE VOTE "AYE."

REPRESENTATIVE Albert J. Hopkins, of Illinois, has introduced a bill into Congress putting the manufacture of oleomargarine and similar compounds on the same footing as the manufacture of whisky and tobacco. His bill provides, first, that all manufacturers of the stuff shall be registered and shall give bonds to the Commissioner of Internal Revenue; second, that every manufactory shall have a conspicuous sign, giving the name and business; third, that the makers of the oil used in the manufacture of bogus butter and cheese shall keep and furnish to the Collectors of Internal Revenue a record of all their sales; fourth, that the manufacturer shall place on every tub, crock, box or other package a printed label similar to those now placed on tobacco packages, stating that all the requirements of the law have been fully complied with; and it shall be unlawful for any party to use such package a second time; fifth, the tax is required to be paid by stamps the same as in the case of cigars, etc.; sixth, imported adulterated butter or cheese will have to pay the same tax as that manufactured in this country in addition to the regular import duties.

The tax is fixed at 10 cents per pound for butter and three cents per pound for cheese substitutes. The penalties fixed for the violations of this Act are made very severe, and no loop-holes are left for the manufacturers to crawl out. "Adulterated butter or cheese" is defined as "any article or compound manufactured, in whole or in part, of any oleaginous substance, oleomargarine, suine, butterine, beef-fat, lard, neutral-vegetable oil, or any substance other than that produced from unadulterated milk, and designed to take the place of butter and cheese, or to be sold or offered for sale as an article of food."

We hope this bill will be speedily pushed through to a passage. It is alike in the interest of every laboring man, every trading man and every producer, as well as of the farmers of this country. It is an act in the interest of honesty as against fraud. We would suggest, however, that the bill is not quite complete. We think the compelling of the entire product to be colored some distinctive tint would provide an easy means for its detection, whether offered for sale in or out of the packages. Let this little ammendment be added and then we hope to see the measure speedily become a law.

BREVITIES.

WE want our friends to try Schwerdler's Maple as an ornamental tree.

FOR *home* use we know not to-day of a better raspberry than the Turner.

THE Rancocas Raspberry seems to be well received. Another season will help to settle its merits at the Rural Grounds.

SHORT, pithy articles from our subscribers are always welcome. We can always find space *for them*. Thus we should help one another.

THE RURAL NEW-YORKER posters for 1885 will be gladly sent to all who will tack them up in their carriage houses or other conspicuous places.

HENDERSON'S "Rose" proves to be one of the best varieties of celery we have ever tried. One can not do much better than to select this and the Perfection Heartwell for his main crop.

CHUFAS, or Earth Almonds, are offered in most catalogues. Under the Farmers' Club of this week two Southern firms are mentioned, giving the impression that they are not offered by Northern seedsmen.

NEXT week we shall give another full exposure of Florida land frauds. Let no one invest a cent in Florida land until he sees the result of our investigation, unless he has inspected the place personally or through a trustworthy and competent friend.

THE very best yellow raspberry we have ever raised is a seedling from Mr. Macomber, of Vermont. It is probably, however, a seedling of the Antwerp, and its hardiness is as yet doubtful. We shall report later. The berry is of the largest size, though rather soft.

THUS far this Winter our Wyandottes have not given us so many eggs by half as last Winter. The reason is, as we believe, that the chicks were hatched later. With our Wyandottes we are again trying the Crested Golden Spangled Hamburgs. But our strain seems tender and feeble.

THERE is a road leading out of Tokio (Japan) 22 miles long with the Retinispora plumosa (an evergreen conifer, somewhat resembling Arbor-vitæ) planted on either side. So we are informed by Mr. Peter B. Mead, who has relatives living there. This tree, as well as its variety, Retinispora plumosa aurea (golden-variegated), thrives well at the Rural Grounds.

YEARS ago, 12 perhaps, we first tried Tailby's Hybrid Cucumber. We thought it then the best of cucumbers, being almost seedless and very tender. We have spoken of it often since, and now it may be found in many catalogues. But it is not a productive variety, and would not pay to cultivate for pickles.

The Poultry Yard.

A FINE BIRD.

We show, at Fig. 49, a handsome specimen of the Partridge Cochin breed of fowls. Our picture is re-engraved from the London Live-Stock Journal. This bird belongs to Mrs. H. J. Goodall of England, and recently won the cup at the Chrystal Palace Show. He was described by the judges as being "as nearly perfect, as birds of his breed are likely to be got." He is very rich in characteristic color; his legs are fluely covered, and he is truly a giant as to form. The Cochins appear to be exceedingly popular in England at this time. Their hardiness, good nature and admirable laying and breeding qualities render them particularly valuable on small farms or in yards. Their large size and admirable table qualities find them many friends among those who do not keep poultry for profit, but simply for the purpose of supplying fresh eggs and chickens for their own use. In this country, the Cochins have not made the great reputation that was expected when they were first introduced. Most farmers desire a "general-purpose fowl," and the Plymouth Rock and Wyandotte come nearer their ideal. Still, we find marked evidences of the Cochin blood among the live poultry sent into the markets, and it is clearly evident that the breed has been widely scattered about. Their march into popular favor hereafter will be slow, but sure. Their many admirable points will surely be recognized when the poultry business becomes more systematized.

POULTRY ON THE FARM.

MICHAEL K. BOYER, JR.

Care of poultry; inducing egg laying; "poultry powders"; perches; Plymouth Rocks; Wyandottes; Brahmas; Leghorns; crosses; eggs for hatching; will the business pay? sources of gain; poultry business on a cash basis; causes of failure.

In the first place, poultry must not be crowded. Here is where the wrong too often lies. Fowls need room, and we must give them plenty of it. Every rule of cleanliness must be enforced. At least twice a year the interior of the house should be white-washed, and the exterior painted. Every week it should be carefully cleaned of the droppings and every two weeks the nests should be destroyed, and new ones substituted. Sulphur should be strewn in the nests to ward off lice. Droopy, or otherwise sick chickens should at once be removed from the flock. Fowls should have plenty of exercise, plenty of fresh water and food, all the greens possible, and, in fact, anything and everything that will promote health and egg production.

Hens can be made to lay, all other assertions to the contrary notwithstanding. Let them have plenty of cracked bone, ground oyster shells, lime, buckwheat, oats, greens, etc. Feeding is everything. Give corn sparingly during Summer, and then only as evening feed, while in Winter it should be more plentifully fed. Change the drinking water several times a day. A few rusty nails placed in it give a cheap and excellent tonic.

The country is full of all sorts of poultry powders, which claim to keep fowls in constant health, with almost a guarantee of an egg every day. Some of these preparations are good, but many are not worth anything. Cleanliness is one of the first and best steps toward the promotion of health. Remember that proper feeding, such as I have mentioned, will give the hens the material, and force them into actual service.

I may add a word concerning perches. In this so many farmers err. I do not like the thin, round prop. I find a wide—say 3x4-inch scantling—roost far better, especially for the heavier breeds. These should be placed about one foot above a dirt catcher (a platform erected directly under the perches), which should not be more than two feet above the ground floor. By this arrangement, the droppings can easily be cleaned away. As a caution, I might advise not to let pullets roost until they are about four months old, unless shape is no object—I consider it of some value.

There are many varieties of fowls to select from, and which can serve many purposes. My particular fancy are the Plymouth Rocks. I prefer them because they are hardy, of good size, excellent layers, and fine table birds. With the proper feeding, they make superior winter layers, and this is a valuable point for farmers to consider, for at no other season of the year are eggs in such demand, nor are they ever at such a high figure as during the cold months. The Wyandottes are also highly rated in all these qualities, only their eggs are smaller in size.

My father was an extensive breeder of the Brahma fowls. My chief objection to them is their heavy weight for hatching. I have known them to crush many young; but it must be said of them that they are faithful mothers, and patient and quiet hens.

The Leghorns are good layers and essentially non-sitters. I have had excellent results from a cross with them and Plymouth Rocks. For general table purposes, almost any variety crossed with Game, gives excellent results. A very successful cross of mine has been the Game with Plymouth Rocks.

When wanting eggs for hatching, pick out a half dozen of your best hens and yard them with a pure cock, and the regular standard will be retained. For general use, a count of 25 hens to a cock will not be too much.

Now, let us carefully consider the value of the business—will it pay?

1st. By a proper system of feeding, and by careful attention, fowls will lay in Winter. It is needless for me to call attention to the prices paid for eggs during the cold months.

2d. The large cities pay enormous sums for early spring chicks. With an incubator and a brooder, we can have a good supply for the market by February or March.

3d. Poultry manure is considered a rich fertilizer, and very salable. Catch up the droppings and make an item of them.

4th. Feathers, too, have a market, and command figures that make it an object to preserve them. Geese feathers especially command high prices.

Let a man invest but $1,000 in the enterprise, and if he has any business gumption whatever he can, the first year, realize six per cent. on his capital. This is no idle talk; I know it to be a fact, and, moreover, I believe that if the strictest attention is paid to the business, a still better result can be obtained. But this is a business that one dare not go to sleep at. He must be wide-awake, and market early and well. Be up with the times, and you'll not "get left."

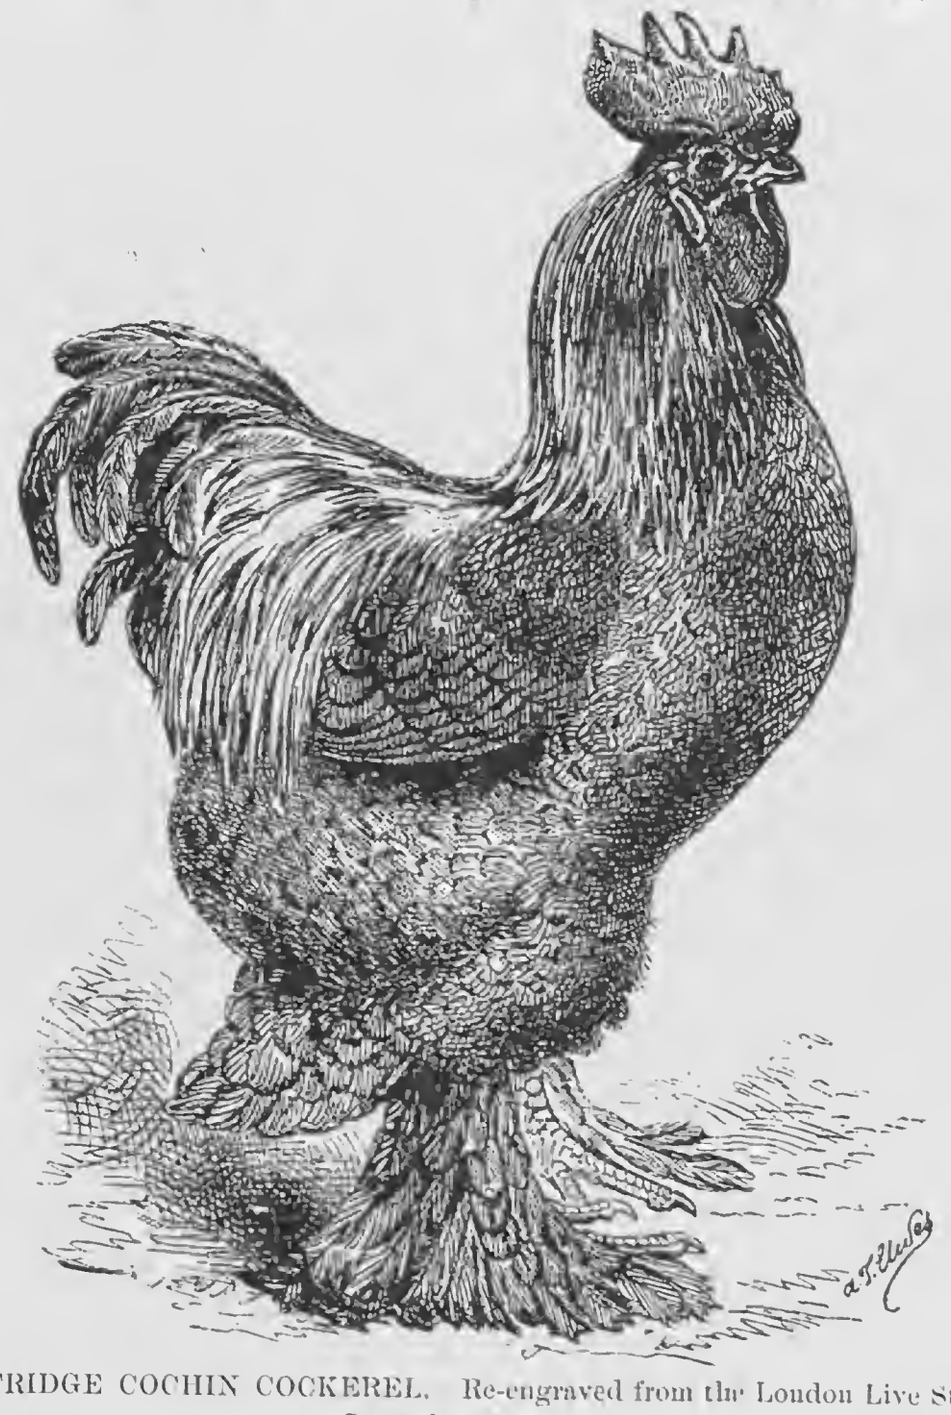
The enterprising poulterer will establish regular custom. For instance, he will arrange with large consumers to supply them regularly with so many boxes of fresh eggs. This the consumer will consider quite an accommodation, and he will pay full prices for every dozen, which gives the poulterer more cash and saves him a large amount of labor. It pays better to sell to consumers than it does to dealers, as you make the profit you would have to give them, and without the outlay of any additional expense or labor. It should be a fundamental rule to get as much real cash as possible. Therefore watch the markets closely.

The enterprising poulterer will set his hens or start his incubator as early in the year as possible, and then, watching the quotations, will ship into the markets just when the prices are at their highest. It is better to sell chick of 1½ pound when the figures are up to 75 cents, than to let your stock average two pounds apiece and have the prices drop to 50 cents a pound.

The enterprising poulterer will also carefully save the manure and feathers, and market them as soon as possible. One cannot afford to overlook trifles in any business. And there is so much scope in the work! Ducks, geese, turkeys, guineas and pigeons are also profitable and add pleasure to the labor. The markets cannot be over-stocked for years and years to come.

The great feature of the poultry business is that it can be conducted on a purely cash basis. You can refuse credit without affecting you in the least. There is always a demand for your surplus, and people expect to pay cash. To my mind no other business requiring such a small capital to start with, in comparison with other enterprises, opens up such a quick trade. I am surprised that more are not engaged in it. I believe it cannot be overrun.

If a man has enough cash to purchase a tract of land, erect substantial buildings, purchase stock, etc., and a little to live with, and keep the mill going awhile, can very soon establish himself. But some fail in this, as well as in any other business, but it is generally their own fault. How? Well, first, by not giving it enough *personal* attention. Second, by not economizing in the right way. Third, by not watching the markets and disposing of the stock when prices are high. Let a man have patience, business tact, enterprise, be wide-awake, and constantly have his shoulder at the wheel, and he will succeed. He will build up a paying business, and can save money.



PARTRIDGE COCHIN COCKEREL. Re-engraved from the London Live Stock Journal. Fig. 49.

Indust'l Societies.

NEW YORK STATE AGRICULTURAL SOCIETY.

[RURAL SPECIAL REPORT.]

The annual meeting of this society was held at Albany on Wednesday, January 20. The attendance was extremely meager and those present were mostly the officers of the Society. James McCann, of Elmira, was elected President and T. L. Harrison, of St. Lawrence Co., Secretary. An evening session was held, attended by but few. Dr. Sturtevant read a paper on silage, and showed samples of corn preserved without any pressure in the silo. The Doctor said the experiments at the New York Station had conclusively shown that too large a ration of silage always had an injurious effect upon the milk and butter; that 10 pounds per day is the most desirable amount. He had also found that a certain amount of acetic acid is, not only not injurious to the cows, but that it produced positively beneficial results. He also thinks that when properly ensilaged, the raw material is actually improved by the process, and that the silage will produce better results than would the same forage in its green state. He also thinks there need be no haste in filling the silos. In 1885 it took about 25 days to put in the corn used to fill the silo at the Station. They had merely leveled the material as put in, not even treading it down, and when filled had put on the plank covering without weighting it at all, and the silage shown was the result. The surface for six inches was found nearly rotten; but below that the silage was bright, and from that the sample was taken. This silage looked of good color, but to the smell it was very sour, and the writer would prefer good mangels or carrots as a diet for the cows whose milk and butter he was to eat.

There is one thing in all these silage-talks not easy to understand. Why is it, that if 10 pounds of silage is so good for a cow, a greater quantity is injurious? No one ever found any injury resulting from a full ration of clover hay or good sound, well cured fodder even if allowed its fill, nor in feeding mangels or carrots if the cows are housed in warm stables. Here is a conundrum for the advocates of "cattle krout" to explain.

Mr. E. H. Roberts, of Utica, delivered a very able eulogy on Mr. Samuel Campbell, the former joint owner of the famous New-York Mills herd of Short-horns with its $35,000 cow, and also a long-time member, and ex-President of the State Society. Gen. N. M. Curtis gave a short history of the cattle diseases of this country, and the measures being adopted to stamp them out. He urged the importance of a National law with a proviso for buying and slaughtering diseased cattle. It would be a good plan if a little more lightning could be infused into this old society, so that its annual meetings, might be something like those of yore, when instead of a couple of baker's dozens being in attendance, the Assembly chamber could not hold all who gathered. Where is the trouble and what the remedy? W.

NEW YORK EXPERIMENT STATION.

(RURAL SPECIAL REPORT.)

The Board of Control held its annual meeting at Albany, on January 19th. All the members were in attendance. The usual method of having the reports of State institutions printed by the public printer is so very objectionable, on account of their being so long delayed, that the Board this year obtained leave to print its own report, and so in making its annual report had a complete printed copy to present. This is a great improvement as the report goes out while the matter is fresh and timely, instead of a year behind as usual.

R. J. Swan, of Geneva, was elected President, and N. M. Curtis, of Ogdensburg, Secretary. In laying out work for the coming year, it was decided to continue the experiments now in progress of feeding cattle to ascertain, by actual tests, what may be called the American-value of certain feeding stuffs. That is, their comparative value as grown on our soils, and as fed in this climate under favorable circumstances both for the production of meat, and when fed to cows, for the production of milk and butter.

A resolution was adopted making the station a "trial" ground for new plants, seeds, vegetables and fruits, without cost to the owners sending them there, and that all such things, sent there for test, shall be considered as only in its hands for trial, and under no circumstances to be disseminated; and that such things should have a full and careful trial and be reported upon from time to time by the station.

This is a step that every station should take. Every State should have several such depots where new candidates for public favor could be carefully tested and an honest report made for the guidance of the people. It would work immense advantage both to the originator of good things and the public. The owner of good things should see to it that their candidates be now placed in Director Sturtevant's hands, as a failure to do so must be construed as an evidence of an unwilliugness to have them fully tested, and their true character made known. The New York Station is doing a good work and taking the lead of similar institutions in this country, and the misfortune is, that some better means are not provided by which its good work may be brought more prominently before New York farmers. We need Farmers' Institutes to do this most thoroughly. W.

YOU WANT IT!—*That No. 22 Enterprise Meat Chopper is worth its weight in gold to every family. While it sells for $4, we give one to any one sending a club of only four new subscribers. Will you have it?*

Miscellaneous.

CRUSHING AND CUTTING CORN FODDER.

I FIND by practical experience, that corn fodder is more than doubled in value by crushing and cutting it. I use a cutter that crushes before cutting, and that cuts one-fourth of an inch long, rendering it all palatable for all kinds of stock, and eaten readily without the least waste. And for me, a pound of stalks that have been harvested at the proper time and well cured, is equal to a pound of the best hay. This may seem to many a little overdrawn. Before I had learned it by experience, it would have appeared to me absurd. A vast amount of stalks are thrown away, so to speak, by being thrown out in barn-yards and fields in the foddering of stock, and in the majority of cases but very little benefit is secured from the practice. The leaves and husks are eaten, and, what I have found to be better, the stalks are wholly lost as a food. J. L. B.

Chatham, N. Y.

FUNGUS CAUSES SCAB ON POTATOES.

I THINK if any one will examine a freshly dug scabby potato with a microscope, he will find a fungus busily at work. I have never failed to find the pest in different fields and at different times whenever the scab appeared.

New Hartford, Conn. C. G. R.

CLEARING LAND.

EVERY farmer who has bushes on his land should clear an acre every year, and if he has turned over a piece this Fall, let him next Summer harrow, manure and seed down, and report.

Portland, Maine. F. H. P.

For Women.

CONDUCTED BY MISS RAY CLARK.

WHAT TO READ, AND HOW TO READ IT.

I.

SEATED the other day on a deal box in my storeroom, and surveying complacently my rows of well-filled jars, I drew a deep sigh of relief at the thought that the breathlessly busy season is over, and the long evenings have come, with the opportunity of growing once more familiar with the printed page. And for the moment a pessimist, I wondered whether, after all, this same printed page is not as often an instrument of evil as of good, whether, when garden and field and preserving-kettle claim us again, we shall lay aside our books wiser and more noble women for their society.

As a result of my musings, it was "borne in upon me" to lift up my voice in the columns of the good RURAL, before our first desultory literary excursions harden into the winter's habit.

There is an idea, as prevalent as it is false, that a woman who is reading is necessarily gaining some culture. The non-literary mind makes no classifications. Books are books; and, if a daughter of the house is prone to become absorbed in reading, her family, and very soon her friends, regard her as devoted to self-improvement, as "a clever girl," perhaps even as something of "a blue stocking;" Never was there a greater mistake! She may be aimlessly drifting along through half-comprehended pages; she may be amusing herself, perhaps as harmlessly, certainly as uselessly, as if she were playing at "cat's cradle;" or, worst of all, she may be committing intellectual and moral suicide, unfitting her mind to act vigorously, or her heart to beat purely and truly. Few subjects are of more momentous importance to us than what we read, and how we read it.

Our associates are, many of them, forced upon us; our books we choose, and by that choice, we are doing much to determine the poise of our minds, and the "ply and tendency" of our characters.

Obviously then, our first rule must be, Never read a *bad* book. No matter how great the temptation; no matter who has read it before you, resist firmly every influence which is for evil and not for good! Life is too short, and sin too powerful for us to lend even our imaginations to the side of wrong. I have heard girls say, laughingly: "When I am told not to read any book, I never rest until I get hold of it!" Do you ever think, girls, *why* you are warned against certain books? Simply because those who love you, know they would sully the purity of your fair souls! Sin may be forgiven, and error retrieved, but who can ever restore the bloom to the peach, or innocence to the heart? Years ago, I heard this narrative from an aged and holy man. I have never lost the impression it gave me. "Thirty years ago," he said, "I was waiting at a street corner for a friend. I opened a volume on a neighboring book stand. The first sentences that met my gaze were of a vile character. I hastily put aside the book, and, seeing my friend, joined him at once. During all these years, I have read many books, wise, eloquent, religious. Alas! how little I can recall from their noble pages; but those few sentences of that ribald volume are written in my memory. I would give worlds to forget them, but I cannot." This little anecdote has been to me a life-long sermon. May it be so to you! While we are upon the painful subject of bad books, let me say that the *worst* books are not those vulgar old stories that everybody has heard of and nobody reads, those stories that "call a spade a spade," and "keeps you so busy holding your nose that you can't even laugh at their jokes," as a recent reviewer cleverly said. Far worse are the refined modern tales that gently break down all the barriers between right and wrong, that use no word which would bring a blush to the cheek of "Mr. Podsnap's" typical "young person," that don't even "leave a bad taste in your mouth," as was said of Balzac, but that subtly and surely make the eternal laws of purity and truth seem to crumble as do the rocks themselves under atmospheric influences! A novel was once given me, which a young girl had just read aloud to a large circle of ladies and gentlemen. She did it with impunity; there was not an "improper" word in the book, but the entire romance treated of a young wife's love for one who was not her husband, and the reader was constrained to give her the fullest and most approving sympathy! A bad, immoral book, under all its delicate wording, even as a book which treats of sin, plainly shown to be sin, may be a pure and noble book. The test is not whether a book can be safely read in general society, but whether any portrayal of vice is sanctified by the motive of the portrayal; whether it puts before us right and wrong as God puts them; whether our utmost tenderness for the sinner results, not in our condoning the sin, but in something like the Divine pity which never forgets to say, "Go, and sin no more!"

Having resolved to read no bad book, resolve just as firmly to read no useless book—no "trash." "I wish," said to me once a gentle-looking teacher, "that Miss Braddon, Mrs. Southworth and Mrs. Holmes were burned on a funeral pile made of all they ever wrote!" I forgave her the exclamation when she told me that, having before her a class of 90 grown girls, some point in the history lesson suggested to her to ask how many had read "Ivanhoe." Six hands were raised! "How many," she continued, "have read "The English Orphans?" and lo, there were 80! "I think 'The English Orphans' is real sweet," I hear some girl poutingly whisper. Ah, yes, my dear, if life were only long enough for everything! But think what great books are lying closed around you while you dawdle over the "real sweet" ones! Don't be frightened at the words "great books;" greatness is always simple, and while the mandlin sentiment will unfit you for your daily duty, whatever that is, the truly great novel, or poem, or biography, if you read it aright, will make you knead your dough more thoroughly and scrub your floors with a more gallant heart! There is an atmosphere about the mountain tops of literature that fills the mental lungs and sends the sluggish blood coursing along the veins, and we come from those hights looking about for something to do "with our might," if only to dust a room! We catch something of the author's thoroughness and fine finish, and, as we cannot put it into words, we are fain to express it in resolute avoidance of all slackness and slovenliness of practical work.

And the last rule of abstinence is: Never read an unaccredited book. It stands on the same footing with the wayside tramp. He *may* be an admirable character, but appearances are very much against him!

And now, having told you what *not* to read, I fear I have already transcended my limits, and must postpone until another letter the fulfilment, or rather, the beginning of the fulfilment, of the promise of my title.

A COUNTRY HOUSEKEEPER.

SKETCHES OF GERMAN LIFE.

BERTHA A. ZEDI WINKLER.

PEASANT CHARACTERISTICS.

THERE are some things which call forth exhibitions of traits quite beyond the surface of ordinary life. Among these are periodical sensations and excitements furnished by that vagabond tribe known as gypsies, traveling acrobats, and itinerant musicians. Their advent marks epochs of village life from a pleasurable as well as pecuniary point of view. For what they do not give in cash for a gypsy's flattering prophecy, or to an importunate smaller appendage of the caravan, they lose by pilferings from chicken-coops and vegetable gardens. Many of the peasants are left poor in purse and poorer in contentment for this reason. Being ignorant, the smallest appearance of anything beyond their common experience or ability, excites superstition and often an inordinate desire for gain by supernatural means. Peasant simple-mindedness and shrewdness is often amusingly illustrated by the escapades of shrewder vagabonds with whom there is no getting even. They have always in reserve that fund of "Mystery and Magic"—mere trickery to call it by its right name—which fills the good people with awe and dreading admiration. The appearance of a "band" is the signal of sharp watchfulness. Geese that have been left to roam at large are quickly driven home and stabled, and so with everything that can possible come within reach of covetous hands. On the other hand, when anything is once stolen no effort is made at recovery though they may see their property in broad daylight by the tents of the thieves, the recovered chicken might have a spell put on her and afterwards lay bad eggs; or the goose shed feathers on which no one could sleep, or die in peace. They have seen the jugglers perform some impossible things and surely anyone that could walk on a tight-rope in mid-air must lean on the invisible arm of the devil. So they look on with grave, absorbing fascination, ask timid questions and are told bold lies for which they pay, quite satisfied, and afterwards go to church more diligently for having had to do with the evil one.

This desire to pry into the mysteries of life as they deem it, is not a healthy craving for knowledge. It is an impulse of cupidity. They judge everybody's motive by their own. Every person known to carry on some business outside the pale of ordinary life and knowledge is credited with supernatural powers from Satan to make money. The mysteries of alchemy still buzzes in many an inquisitive head, and souls are yet subscribed for obtaining knowledge of some "black art."

All this is quite in keeping with characteristics of a better tendency. Their necessities drive them to scheming for better conditions, and their superstitions and general ignorance of the wide world keeps them from realizing their folly, while the sinfulness of it is outweighed by some such thought as "the church we have always, but the magic man comes but once a year." After a week of excitement and wealth-seeking in vain, everybody settles down and makes the best of their old life, sorry that they have been tempted from it even in thought, and heartily glad, after the pastor's visits and reconciling prayers to God, that the devil did not come when they called him.

Besides the traveling shows, there is a peculiar mode of communicating tragic and sensational news from the cities. The latest murder, robbery, or railroad accident is carried in descriptive and horribly illustrated detail on painted canvas from village to village, by some moneyless adventurers who make a living in this way.

While the gaudily painted canvas picture of the tragedy, given, of course, in its most exaggerated style, is displayed on every street by turns, the bearers, in horrible monotonous and doggerel verse, sings of the occurrence and everybody stands agape. Tears soon come to the eyes of the most susceptible, and everybody's feeling is wrought up to an injurious pitch. That being all the news that comes to them of the great world, they are not likely to form a very high estimate of it. To them it is a maelstrom of wickedness. And if they only go to the city to yearly market, they keep guardedly within their booths, or preserve that half scared watchfulness, if necessity takes them around, which we can see in their faces any day at Castle Garden.

AS THE HOMES, SO THE NATION.

"IF our homes were all abodes of purity there would be no more national questions of reform to solve. There would be no more evils rising up and overshadowing our land till they must be supplanted by reform or crushed out by revolution. If every school girl could perfectly understand this, what a step would be taken in the advancement of the next generation! In conversing upon this topic the other day, a lady of rare culture and intelligence said "I always feel a twinge of unpleasantness whenever any one speaks of the corrupt government at Washington, for it always brings to my mind the thought that there is a corrupt people behind it. The government cannot rise above the people. When the day comes that the farmer comes to town with just as straight sticks of wood on the bottom of his load as he has on the top, and just as large potatoes on the bottom of his basket as he has on top; when the merchant gives full measure for a yard; when capitalists do not cheat their dependents—then and not till then we shall hear no more of bribes and the stealing of public money at Washington."

I thought this remark would grace any political speech, but ladies as a rule do not make political speeches, yet we can do a great deal in our homes for politics. No woman should think she is prepared to converse intelligently in a mixed company without being well versed on all political questions of the day. To thoroughly understand these things is to make women more thoughtful of their responsibility and to make a closer connection between our home and our public life. The home life should foster in every child such a love for truth and virtue that the National life will be strengthened in such characteristics. So let us see to it that the daily newspaper is often found lying on top of our fashion magazine. EMMA C. STOUT.

JET BONNET.

ANY one having a little knowledge of millinery, as well as some taste, can always make

over a bonnet or make a new one, more particularly if they have something for a pattern. So we present in this cut an exceeding-

Miscellaneous Advertising.

Art needle-work and valuable embroideries are frequently ruined, or their beauty much impaired by washing them with ordinary soap, which is too rank for such delicate articles. A simple, and the proper method is to make suds of hot water and Ivory Soap, and allow to cool till lukewarm. This solution, while very effective, is perfectly harmless.

Free of charge. A full size cake of Ivory Soap will be sent to any one who can not get it of their grocer, if six two-cent stamps, to pay postage, are sent to Procter & Gamble, Cincinnati. Please mention this paper.

ly stylish, but easily to be made bonnet. The front has the velvet put on in bouillonnes, or puffs, divided by rows of beads the color of the velvet used. If brown, then brown beads, or iridescent, which makes the bonnet rather more dressy. The lace has fine wire run through so that it can be arranged in high loops and, be made to keep in place. The strings are of velvet ribbon.

TABLE MAT.

MRS. HIGHTON'S DIARY.

ANNIE L. JACK.

JANUARY 10th.—The holidays are over, we are settled down to steady routine and fearfully cold weather. Edgar says this house is not nearly so warm as his late lodging, and the water-pipes bursting the other day, added to the discomfort. I wonder if he is sighing for the freedom and comfort he used to enjoy. Last night I had a bad headache and went to lie down in my dressing room. I must have fallen asleep, for when I awoke I heard voices and recognized Jack Sebright. He said something in a bantering tone and then I heard Edgar's reply: "Its no joke having a sick wife and a careless servant, old boy. Why, I had to go to a hotel for my breakfast yesterday; wife couldn't get up and there was no sign of breakfast. My business requires promptness—I can't wait." "Why didn't you get up and cook it yourself, Ed?" inquired Jack; "It would remind you of the old camping days." But Edgar made no response, and I could smell the tobacco that they puffed away in silence. That is one thing I have against Edgar; he gave up smoking before we were married to please me, but as soon as we were fairly off on our trip he began to smoke cigars. I hate tobacco; it makes me so sick, and I do think he has very little consideration for me. But my headache vanished as I lay on the sofa, and I arose and bathed my face, combed my hair and put on a pretty dress. Then going down to the parlor began playing softly one of Chopin's waltzes, after turning up the gas. The gentlemen soon came down stairs, and Edgar's "Why, Dolly!" amply repaid me for the effort I had made. But how homesick poor I was in that quiet parlor with the newness shining on everything and Edgar and his friend criticizing, even though perhaps they admired me. I was proud of my music, for at one time I had intended to devote my life to it; that was before Edgar came and changed the current of my thoughts. Dear mother always made me practice and study, and did all the cooking herself; she was used to it, she said, and I was far better at entertaining company, so I did not learn how to bake and boil and attend to the thousand and one things a housekeeper must. Oh, how I miss the comfort of my old home! Yesterday we had a boiled ham for dinner, and I know mother used to have a box of parsley in the kitchen window that stayed green and crisp all Winter, to be used for trimming, or in sauce, so I sent the girl to the greengrocers to get some. It was 50 cents for such a little handful, and hard to get, she said. So different from home, where everything is so plentiful, for if I want a few apples, or a carrot for the soup, it costs so much to get it. We have a cellar, but the furnace makes it so hot we cannot keep anything in it, and I always feel so lonesome when I just look down into it and think of home and all the good things mother kept down there, from cabbage and celery in the outer compartment to cherry cordial and apples and the wonderful jars of fruit.

HOUSEKEEPERS' MUTUAL HELP CLUB.

GLADDYS WAYNE.

IT has often seemed to us that the housekeeper who has that "mine of wealth," a good orchard, to draw upon, need never be at a loss for something nice for dessert.

Apples may be prepared for the table in so many ways that they seem invaluable. The following, long practiced at our house, is an excellent way: Pare tart apples and with a pointed knife remove the calyx end of the core; put the apples, stem down, in a shallow baking dish, one apple deep, fill the cavity in each with sugar, also sprinkling sugar (more or less as you wish them rich) among the apples, pour in hot water to nearly half fill the dish. Bake till soft, then remove to a plate to cool, pouring over them whatever sirup may remain. The lower part of the apple should be clear as amber, the upper a light delicate brown. When piled on a glass dish or white plate to be served, this makes a pretty dish. They may be served plain or with sweet cream. The Spitzenberg cooks very handsomely this way. However, though the housekeeper may bake and stew and preserve, converted into pies, puddings and all the dainty dishes known to her art, in my opinion she can never add to the native wholesomeness, deliciousness and beauty of the apple, the peach or the pear. Pile glass dishes with the fresh, ripe, mellow fruit, and what fairer or more delicious dessert can be desired? And who would not rather be treated to a simple dessert like this (or none at all) than have, when visiting, the hostess spend the greater part of one's stay in preparing elaborate dishes that give not half the pleasure derived from these fair creations of a higher hand.

The lack of apples, etc., which seems one of the greatest inconveniences of a "new" country, has led us to give the culture of small fruits our greatest attention. I wonder if this lack also leads the Western sisters to resort to this method of securing fruit? Strawberry plants may be had so cheaply by mail, and they propagate so rapidly, that the cost of starting in their culture is very small. Currants and gooseberries well repay the care given them, both being easy of cultivation since we have learned to outwit the currant-worm. It is said that if the bushes are shaken each night after sunset the first week in June, it will destroy them; but a sure method, as all probably know, is to dust the bushes with powdered white hellebore. Gooseberries make excellent sauce; they are nicest used nearly full grown, when they scarce begin to ripen. I cook them with half their weight of sugar, and while boiling hot, fill the cans and seal them tightly, tightening them from time to time as they cool. Currants—red or white—are used ripe in the same way. Black currants, ripe, are also nice this way.

Uncle Dan says that gooseberries dried in sugar are an excellent substitute for raisins in mince pies. And by the way, some of the citron preserves, so dear to the masculine heart, also improve the mince pies; and mother thinks that mince pies without sugar-dried strawberries are not complete, whatever the other ingredients.

REWARD OF LABOR.

IN much of the work we are called to perform, there is a reward which far outweighs the strength expended. How many times, in the course of the year, do we reap actual benefit as a result of patient toil. Very fully do we housekeepers realize this, as we enjoy the simple home-comforts, which our busy hands help to produce. Have we sweet, clean, tidy rooms?—It is because we do not sit down in idleness. Do our children brim over with good nature and healthy activity?—It is because they are not neglected.

Do we not feel happier when we know that our daily duties have been bravely met—even tho' weary oftentimes—than tho' we had folded our hands and sat idly looking on while others worked for us?

How much better to be well and have plenty to do, than to be dragging out weary days upon a bed of sickness. MRS. S. B. E.

SUBSTITUTE FOR PUMPKIN.

I went into a neighbor's kitchen the other day, and she set before me a piece of pie to eat while we talked. "Your pumpkin pie is rather high colored," I said as I finished the last bite. "It's carrots," she said. I detest carrots—the flavor and smell and taste of them—but here I had been cheated into eating them, and did not know it. The pie was very good; made just like pumpkin. Things depend largely on how they are made. A. L. J.

One tablespoonful of kerosene beaten in one cup of soft-soap and rubbed among soiled clothes when put to soak, will make the washing easier. Kerosene also softens old, hard leather. MRS. A. L.

Catarrh

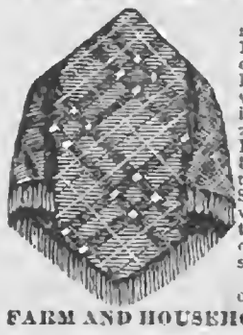
Is frequently an indication of a Scrofulous taint in the system. Ayer's Sarsaparilla purifies the blood, and thus restores health to the affected membranes. It also stops the nauseous catarrhal discharges, and prevents the infection from reaching the lungs and stomach. Catarrh should be treated as a blood disease.

I suffered for years from chronic Catarrh. My appetite was very poor, and I felt miserably. None of the remedies I took afforded me any relief until I commenced using Ayer's Sarsaparilla, of which I have now taken five bottles. The catarrh has disappeared, and I am growing strong and stout; my appetite has returned, and my health is fully restored.—Susan L. W. Cook, 909 Albany st., Boston Highlands, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

PLAID SHAWL GIVEN AWAY!



Through the failure of a large manufacturer of Cashmere Pattern Fringe Shawls, there has come into our hands a large consignment of Plaid Shawls, perfect goods, which we propose to present to the ladies in the following manner: Send us 25 cents for **3 mos.** subscription to **Farm and Household,** a large **32 page** illustrated paper, devoted to Farm and Household topics, Stories and general miscellany, and we will send you one of these **beautiful shawls FREE** by mail postpaid, or we will send 5 shawls and 5 subscriptions to one address for $1.00. **Satisfaction guaranteed** or money refunded. News of the Week.

HOME NEWS.

SATURDAY, Jan. 23, 1886.

THE anti-Chinese agitation still continues on the Pacific Coast. On Wednesday night, all Celestials in Chehalis, W. T., were driven for refuge to the brush by a gang of hoodlums. Most of the poor fellows were bare-headed and footed. It was snowing hard.....President Darling of the Toronto Board of Trade says that at the close of 1885, trade in the Dominion was in a sounder condition and business more active and healthier than at the opening of the year. Payments of late have materially improved, and purchases have been made with great caution.....The Cigar Manufacturers' Association of this city have declared a "lock-out" against over 7,000 men, women and children in their employ, who wanted a trifle more than starvation wages..... ....The Superintendent of the Board of Health of Montreal reports that there is not a single case of smallpox in the city or suburbs..... ....Still reports continue to come from the Northwest Territory that the Blackfeet Indians will "rise" in Spring. Now they are wandering off their reserves well armed, resisting the police authorities, etc. Sir John Macdonald says, however, that such reports come from malcontent traders, and that there is no fear of any trouble..... "Boycotting" is rapidly extending in this country. The Cigar Makers' Union threaten to boycott the goods of 14 firms that have locked their shops in this city. Three firms are boycotted in Syracuse, N. Y. The Knights of Labor have boycotted four manufacturers in Chicago. In Massachusetts alone, there are 200 local assemblies of the Knights of Labor, and all join in boycotting persons and their goods against whom boycotting has been declared. In Ireland, the evils of boycotting are by far the worst, and it is to suppress the practice that all parties in the English Parliament are inclined to combine in stringent legislation.....The divorce cases in Lane County, Oregon, for 1885, outnumber the list of marriages twelve to one, according to the San Francisco Bulletin..... The Government anti-Bell telephone suit is to be tried in Washington first, before the District Supreme Court, and then, whichever side wins, before the U. S. Supreme Court.... The Government is bringing suits against people who have unlawfully cut timber on the unsurveyed public domain. One fellow in Utah has mills of 10,000-feet a day capacity, and the lumber is worth $4 per thousand feet in the tree!.....The Labor Committee of the House of Representatives has acquired much importance owing to the organization of so many industrial societies, such as the Knights of Labor, the Granges, etc. The Committee is to introduce a bill raising the head of the Agricultural Department to the position of a Cabinet officer as Secretary of Agriculture and Labor. There was great competition to get good places on this committee, by those who wished to influence the "working men's votes."..... One of the severest storms that ever visited the Pacific coast began on Sunday and reached its greatest force about noon on Thursday. It raged from the northern boundary of Wyoming Territory to the southern boundary of California—rain, snow and wind at the rate of 82 miles an hour most of the time, wrecked houses, shattered windows, flooded basements, upsetting of wagons and railroad cars, total interruption of telegraph communication, railroad washouts, etc.. .... The silver discussion has been active in Congress during the week, where bitter language was used about the "conspiracy of capitalists and bondholders" who want a stop put to the coinage of silver dollars. Senator Beck, of Kentucky, started it; then Vance, of North Carolina, both Texas Senators, and Brown, of Georgia, joined in. Eustis, of Louisiana, wants to pay the interest on the $10,000,000 worth of bonds recently "called in," entirely in silver. The silver men are decidedly the most aggressive.....In Maine, the great prohibitionist State, over half the commitments to jail last year were for drunkenness, and exceeded those of the year before by 440. More bloody crimes and murders were there due to liquor than in any other State in New England! ..... Ex-Senator Ross, of Kansas, has been appointed Governor of New Mexico. .....Southern Dakota has 450,000 population—much more than is requisite—and having already elected Senators and Members of the House, is demanding admission into the Union as a State. There is a very good chance that she will be admitted, though some Congressmen growl that she didn't wait until her admission before electing Congressmen. Several of the old States, however, acted precisely in the same way before demanding admission ....Secretary Bayard and Chairman Belmont, of the House Committee on Foreign Relations, are reported to be heartily in favor of the negotiation of a new treaty of reciprocity between the United States and Canada. Public opinion on the other side of the boundary is also making itself known. At Halifax, for example, the Chamber of Commerce has unanimously resolved to urge the Dominion Government "to negotiate such reciprocal trade relations with the U. S. Government as would be mutually advantageous to both countries." .....Blaine goes strongly for silver coinage.....As the idea gains ground that the Panama Canal will prove a failure, the Nicaragua Canal route is gaining a great access of attention. It is thought much more practicable than Ead's Tehuantepec ship-railroad scheme.....Apostle Lorenzo Snow was sentenced last week in the District Court at Ogden, Utah, on each of three convictions of unlawful cohabitation, to six months' imprisonment and $300 fine and costs. James H. Nelson, on one conviction, was sentenced to six months' imprisonment and $300 fine and costs. Both men were defiant. James Taylor, on promising to obey the law, was sentenced for the same offence to pay a fine of $300 and costs, but without imprisonment.....Gov. Cornell says there is no intention among the Grant monument corporators to ask for public aid from the State or Congress. The fund now amounts to $114,145.....The earnings of the Canadian Pacific Railroad during 1884 were $8,349,557; expenses, $5,124,374—net earnings about three millions and a quarter, against a little over a million in 1884. The increase is chiefly due to transportation of troops, ammunition, etc., and also food, during Riel's rebellion.....The movement of manufacturers to avail themselves of the Pennsylvania natural gas as fuel is growing, many large manufacturers removing to the area where it can be obtained, as an enormous saving is made in the cost of fuel for furnaces, etc. The Standard Oil Company has gone into the business heavily, and will supply the gas to both Buffalo and Cleveland—the farthest points to which it has hitherto been driven.....One of the most serious explosions in the history of the Rocky Mountain mines took place early Wednesday morning last week in mine No. 4 at Almy, Wy., causing the death of 13 men..... An important decision of the United States Supreme Court in the Mississippi railroad cases completely settles the question that a State Legislature may pass laws prohibiting unjust discrimination in freight charges. It shows, too, that if the State Legislatures do their duty, there is no need of invoking the powers of Congress.....The cashier of the late Wall Street firm of Grant & Ward says that their debts at the time of the failure amounted to $16,792,647. Since that time $11,770,039 had been paid to creditors. The amount which would probably be realized from the remaining assets was about $150,000. So, at best, there will be a deficet of about $5,000,000 !..... Cornell University has 635 students—26 more than ever before in the history of the institution. More are coming.

AGRICULTURAL NEWS.

SATURDAY, Jan. 23, 1886.

A BILL is to be introduced into Parliament by an Irish member, providing "for the growth and cultivation of tobacco in Ireland."..... ....In the west of Ireland out of 9,300 tenants under the Land Act of three years ago, which greatly reduced rents, 7,100 now absolutely refuse to pay a cent of rent unless an abatement of from 10 to 50 per cent. be made in the "fair rents" provided for in that law. Starvation among the peasants and fishermen along most of the west Irish coast....The annual meeting of the Pennsylvania Board of Agriculture and a general Farmers' Institute will be held at Harrisburg, Wednesday and Thursday, January 27 and 28. Every farmer in the State is invited to attend.....In Southern California, unthrashed barley, baled as hay, brings $20 per ton.....On the Rio Grande Plantation, Cape May County, N. J., 7,420 tons of unstripped sorghum cane were gathered from 960 acres. The marketable sugar made was 281,000 pounds; sirup, 50,000 gallons; seed, 10,000 bushels, all finding ready sale at fair prices..... ....Cigar manufacturers are vigorously protesting against any increase of duty on Sumatra tobacco. The tariff bill of 1883 increased the duty from 35 cents to 75 cents per pound, and they protest against a further increase to $1.50 and $2 per pound as proposed. Tobacco growers, however, are well organized and very urgent for the increase. The present duty of 75 cents per pound is five times greater than the average price of leaf tobacco grown in the United States..... ....Michael Davitt approves the proposition to buy out the Irish landlords, and suggests an Anglo-Irish arbitration Commission to settle terms of the purchase.....Complaints come from Florida that several people have been "poisoned" by eating frosted oranges; the cold drove inward the "poison" naturally held in the skin.....The New York State Court of Appeals sustains the law establishing a milk standard of 12 per cent. solids and 88 per cent. water.....Five members of the Hausmeyer family at Tarentum, Pa., have died of trichinosis. The lives of the three remaining members of the family are despaired of. ....Marshall P. Wilder helps along the Massachusetts State Agricultural College by giving its library 250 volumes of agricultural and horticultural periodicals and pamphlets, 60 bound volumes—a complete set—of the London Gardener's Chronicle (folio), that cost $500, each volume containing the giver's autograph, the records of the American Pomological Society for 37 years, and of the Boston Society of Natural History from 1866 to 1885 inclusive... ....The New York State Beekeepers' Association, founded by Moses Quimby in 1868, will hold its annual convention in Rochester, Feb. 2–4. All associations in the State are entitled to three delegates. New York beekeepers are invited to attend.....The estimated yield per acre of the corn crop in Illinois for 1885 is 31.7 bushels, the largest since the crop of 1880.....Trappers in the towns of Western Massachusetts have been unusually busy this Winter. Muskrat skins are worth from 25 to 35 cents in Springfield, and good fox skins sell for $1.....The chemical preparations that have been resorted to in France to check the ravages of insects in vineyards appear to have failed, and the report comes that mildew and phylloxera are fast spreading.....In spite of, or rather owing, in part, to the constant exportation of horses from the United Kingdom, there is a serious scarcity there of horses suited for certain purposes. The latest returns published by the War Office regarding the 24 regiments of regular cavalry in the British army, show that for upward of 17,500 cavalry troopers there are only about 10,300 chargers. .....Revenue frauds have been discovered in Chicago in the importation of potato starch as farina. Farina is on the free list, while there is a duty of two cents per pound on potato or corn starch. The frauds have been going on for years. No doubt many other shipments have escaped detection. Has this had any influence on the low prices generally paid for potatoes at the starch factories?..... A new State Agricultural Society of Massachusetts, has been organized, so that the old "Loring ring" has been completely "knocked out." Edward Burnett, of Southboro, was enthusiastically elected President is spite of his strong protests..... The number of Texan and Indian cattle received in Chicago last year was 298,188 head, against 259,374 in 1884. From the Northwest the receipts of range cattle last year were about 30,000 less than in 1884. During 1885 Swift & Co. slaughtered 429,483 head of cattle, Hammond & Co. 160,960, Armour & Co. 325,131... .....The total receipts of wheat and flour expressed in wheat at San Francisco in 1885 was 16,890,278 centals, against 17,277,840 centals in 1884, according to the Commercial Herald. This represents in bushels 28,160,465 for 1885, and 28,796,400 for 1884..... .....The wool clip of California in 1885 was 36,561,390 pounds, which is the smallest since 1873, although but 852,940 pounds short of 1884. The average annual clip for ten years ending with 1885, is 44,393,000 pounds, the largest year being 1876, 56,550,970 pounds..... .....The receipts of Western dressed beef at New York and Jersey City last year more than doubled the receipts in any former year! At the lowest estimate they averaged 100 car-loads per week, or 5,200 car-loads for the year; equal in round numbers to 160,000 carcasses. The receipts at Orange, Newark, Paterson, and other outlying cities and towns which formerly drew their supplies from the stock-yards will carry the total up to 200,000 carcasses, equal to one-third of the total beef supply of New York City and it environs..... .....The English Privy Council has just permitted the immediate landing of Canadian cattle carried on vessels that had touched at an American port before taking them on board. The rule used to be that no cattle could be landed alive from a vessel which within 30 days had touched at a scheduled port, unless for slaughter at the port of debarkation. Canadian cattle can now be taken directly to pasture from such ships.. ...The New Jersey State Board of Agriculture will hold its annual meeting in the Masonic Hall, Trenton, N. J., on Tuesday and Wednesday, February 2 and 3, commencing at 10 o'clock, A. M. We notice that a wide-awake programme has been provided and New Jersey always exceeds rather than falls behind the promised interest. P. T. Quinn, Secretary, Newark, N. J.....

QUARTER CENTURY devoted to the improvement of Thatcher Orange Butter Color. It was the first, is the best and has been every day in every year. If you want the highest human testimony, send your address to H. C. Thatcher & Co., Potsdam, N. Y.—*Adv.*

Crops & Markets.

SATURDAY, Jan. 23, 1886.

THE Chicago Times the other day reports from nearly 590 points as to the crop of corn and hogs in the Northwest and Southwest. It appears that the yield of corn has been overestimated and its quality ranked too high. Ohio and Indiana framers have sold more freely than those in other States. Hog cholera has made its appearance in every State of the corn belt, forcing hogs upon the market much more rapidly than is usual, and it is probable that the receipts at the chief packing points for the remainder of the season will be less than last year.

It is reported that the biggest wheat deal ever attempted is now in progress in Chicago. It is said to be worked by Phil. Armour and the Minneapolis millers, as well as by railroads, elevators and "grain" banks. It contemplates putting wheat down as low as possible—certainly below 80 cents at Chicago—buying in heavily as it descends, and then jumping for a profit of 30 to 40 cents, making the price over $1.20 in May. Pork and provisions are to go up with it. The amount of wheat to be "controlled" to render the scheme successful is, it seems to us, by far too large to permit shrewd men to embark in such an enterprise. According to good estimates, 292,000,000 bushels of wheat remained on hand on Dec. 31, of which 58,000,000 bushels were in the "visible supply" and 234,000,000 invisible and in the form of flour. It may be that the latter estimate is too large, for all the interior storage points, such as St. Louis, Chicago, Milwaukee, Detroit, Toledo and Buffalo, have been receiving orders from millers in the country for supplies of wheat, which shows plainly that little or no wheat exists in their neighborhoods. Council Bluffs is buying wheat in Chicago! Evidently there is not a large surplus in the hands of farmers, or, if there is, they are able and determined to stick to it for higher figures. The Northwest holds fast to the opinion that 90 cents for cash, No. 1 Hard, is about right, and though it has touched 84 cents at Minneapolis, but little was marketed at that figure, and confidence in 90 cents remains firm...The general impression is that the recent frigid wave did little or no harm to winter wheat, as its advent had been preceded by a heavy fall of snow, which warmly blanketed the crop..... Last Saturday there was a drop of one to two cents per bushel in wheat, due to the large visible supply and to a foolish rumor that the English Government would recommend a duty on wheat imported from the United States into the United Kingdom. On Tuesday there was an advance of 1¾ cent per bushel, due to a decrease of 850,000 bushels in the visible supply, and to reports that Austria, Russia and Turkey, as well as all the Danubian States, and perhaps most of the rest of Europe, would be at war as soon as Spring renders campaigning possible—and certainly bloody trouble seems brewing north of the Balkans. There seems little doubt now that the visible supply will rapidly decline even in the absence of exports, as receips are small and sales to millers at interior points sharply increasing.

Indian corn has followed wheat. When the advance in wheat prices came, corn showed an improvement in prices too, though to lesser extent, and there was not so much activity in the market. There is considerable interest taken in the reported plan of the Chesapeake & Ohio Railroad to ship corn freely to Newport News for storage.

The oats market has been quite but moder-

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria,

ately firm, with a movement visibly influenced by those of wheat.

Armour & Co., of Chicago, have been bulling hog products during the week, as the supplies of hogs at packing centers have declined below late expectations, and the "visible supply" of hogs is considerably less than expected, as so many were rushed to market earlier through fear of hog cholera.

At Philadelphia hog products have been moderately dealt in, but the market has ruled firm at a slight advance. Butter has been very quiet, owing to the inferior quality of most of the receipts. The trade in artificial butter is showing greater activity, owing to the scarcity of fancy lots of the genuine product. Three-fourths of the stuff sold in the wholesale market is butterine. Poultry and eggs have declined and close dull under liberal supplies. Fruits and vegetables continue quiet but steady. . . . Provisions at St. Louis generally are dull and weak, in sympathy with other markets. Cattle and hogs are advancing and active, though the quality of receipts is mostly poor. . . . At Milwaukee hogs are advancing, the supply being light, and products are higher. There is a good demand for meats.

According to the Buenos Ayres Standard, this season's crop of linseed from the River Plate country is roughly estimated at 200,000 tons, or ten times in excess of last years, and the tremendous growth of linseed farming is such that a crop of one million tons is expected next year. The figures above give a crop of eight million bushels, calculating 40 bushels to the the ton, and if next year's expectations are realized, the crop of South American seed would reach 40 million bushels. In the census year the American production amounted, in all, to only 7,190,951 bushels.

Brown's Bronchial Troches will relieve Bronchitis, Asthma, Catarrh, Consumptive and Throat Diseases. *They are used always with good success.*—Adv.

MARKETS BY TELEGRAPH.

SATURDAY, January 23, 1885.

CHICAGO.—Compared with prices a week ago, "regular" wheat is ⅝c. lower; No. 2 Chicago Spring, 1c. higher. Corn, ⅝c. higher. Oats, ⅜c. higher. Pork, 55c. lower. Cattle, a trifle lower. Hogs, from 15c. to 25c. higher. Sheep, from 15c. to 20c. higher.

WHEAT, strong; sales ranged: January, 78¼@80¼c; February, at 79⅝c@80⅝c.; May, at 85c@85⅝c.; No. 2 Spring, at 80¼c.; No. 3 Spring, at 67c. CORN—Higher and firm; Cash, 36¼c.; January, 36⅝@36¾c; February, 36¾@37c. May, 40⅝@40¾c. OATS—Steady; sales ranged; Cash, 29c; January, 28¾@29c; May, 31¾@32c. RYE—Dull; No. 2, 57c. BARLEY.—No 2, 63@65c. PORK—Active; Cash, $10 95@11 00; January, $10 97½@10 45; February, $10 87½@11 00; May, at $11 15@$11 32½. LARD—Firm; sales ranged; Cash, $6 15@6 17½; January, $6 15@6 17½; February, $6 15@6 17½; May, $6 35@6 37½. BULKMEATS—Shoulders, $4 00@4 05; Short rib sides, $5 35@5 37½; Short Clear sides, $5 70@5 75. CATTLE—Market quiet; Shipping steers, $3 50@5 90; stockers and feeders, $2 70@4 00; cows, bulls and mixed, $1 85@3 75; bulk, $2 90@3 35. HOGS—Rough and mixed, $3 60@4 05; packing and shipping, $4 05@4 40; light, $3 35@3 95; skips, $2 50@3 45. SHEEP—Market firm; Natives, $2 25@5 00; Western, $2 20@4 25· lambs, $4 00@5 75; Texans, $2 00@3 80.

ST. LOUIS.—Compared with cash prices a week ago, wheat is ⅝c. higher. Corn, ¼c. higher. Oats, ⅜c. lower. Rye, ½c. higher. Pork, 50c. higher. Cattle, a trifle higher. Hogs, from 10 to 15c. higher.

Wheat strong. No. 2 Red, Cash, 88¾@90c.; January, 89½c.; February, 90c.; May 95¼c.. Corn firm; Cash, 33¾@33¾c.; January, 33⅝@33¾c.; February, 33¾c.; May, 37½c. Oats dull; No. 2 Mixed, Cash, 28⅝@28¾c.; January, 28¾c., May, 31½c. Rye steady at 58c. Barley dull at 60@60c. Eggs steady at 17@17½c. Flax Seed steady at $1 08. Pork, $11 00. Bulk Meats—Long Clear, $5 25; Short Rib, $5 40@5 45; Short Clear, $5 45. Lard firm at $6 00@$6 0.. Cattle—Market fairly active. Good to Choice Shipping, $4 80@5 20; common to medium, $3 90@4 50. Native Butcher Steers, $3 25@4 25; Cows and Heifers, $2 25@3 50; Stockers and Feeders, $3@4. Hogs.—Market strong and active. Butchers' and best heavy at $4 10@4 30; mixed packing, $3 80@4 05; Light, $3 50@3 80; SHEEP—Market steady and unchanged.

BOSTON.—Compared with cash prices a week ago, corn is about ¼c. higher; oats, ¼c. higher; hay and straw steady; butter steady in most grades, with a slight advance in some. Cheese almost unchanged, slight upward tendency. Eggs steady. Potatoes from 5c. to 10c. higher.

BOSTON—GRAIN—CORN has been in moderate demand. We quote Steamer Yellow, at 51@51½ steamer mixed at 50@50½c; and no grade at 49@50c. per bushel. OATS—Have been quiet but steady, with sales of barley oats at 41@42c; No. 2 white at 41½c@42c; No. 3 white are held at 41@41c, per bushel. RYE has been quiet at 67@70c, per bushel. BRAN is steady at $18 00 for Spring and 18 50 for Winter; fine feed and middlings at $18 00@21 00, and cotton seed meal at $25 00 on spot and $23 00 per ton to arrive. HAY AND STRAW—Hay is a little firmer at $19 00@20 00 per ton for choice and fancy, $17@18 for fair to good, $16@18 for fine and $13@15 for poor and damaged. Western choice $16@17 do fair to good $14@15. Rye straw is held at $19@20 for choice, and $13@14 for common to good. Swale hay, $11@12; Oat straw, $9@10 per ton. PRODUCE—The various articles under this head continue to command fair prices. BUTTER-Northern creamery, choice to extra 23@25c; good to choice summer, 15@20c; western creamery, 21@23c, for choice to extra; northern dairy, 22@23c, for Vermont extra; 18@20c, choice, and 12@16c, for fair to good; Western dairy, 18@22c, for choice, and 10@15c, for fair to good; Imitation creamery at 15@25c, for good to extra; ladle-packed, at 20@22c, for choice. CHEESE—New York choice to extra, 9@10½c, and common to good, 8@8c; Vermont choice to extra, 8½@10c, and common, 6@7c; Western common to extra, at 4@9½c. Sage, extra, 11@12c, good to choice, 8@10c. EGGS—Cape and near-by, per dozen, 23@24c; Eastern extras, at 27c; do, firsts, at 25c; Northern, fresh, at 26c; Western fresh, 23@24c; Provincial, 24@26c. BEANS—Choice Northern hand-picked pea, at $1 60@1 65 per bushel; do, do, New York, $1 55@1 60; do, do, screened $1 25@1 35; medium choice, $1 50@1 55; do, screened, $1 25@1 40; Yellow Eyes, improved, at $1 55@1 60; do, choice flats, $1 40@1 55; Red Kidneys, $1 80@2 00. Canada peas, 85c@$1 00 per bushel for common to choice. Green peas, Northern, at 90c@$1 00; do, Western, $1 20@1 25. Potatoes range at 60@80c, per bushel, as to quality.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, January 23, 1886.

STATE OF THE MARKET.—Compared with cash prices last week, flour is unchanged; wheat from 1c. to 1¼c. lower; corn 1c. to 1¼c higher; oats ¼c. higher; pork 25c. higher; butter and cheese steady; eggs, a shade lower; poultry lower in consequence of large shipments and uncertain weather; vegetables steady.

LIVE STOCK MARKET.

NEW YORK, SATURDAY, January 23, 1886.

BEEVES—Total receipts for the week 10,481 head against 10,880 for the same time last week. Shipments of meat for the week, 744 live cattle, 5,195 quarters of beef, 180 live sheep and 449 carcasses of mutton. The highest price was paid for one extra fine grade Shorthorn from Kentucky. This animal weighed 1,580 pounds and $6.35. One bunch of 47 good steers averaging 1,325 pounds brought $6. These were well matched as regards shape, color and weight. Such uniformity goes far with buyers. Several lots of dry cows in very poor condition, sold as low as $2.90. As a rule, the cattle offered were a trifle lighter than usual, but they were of better shape. A few bulls and old stags were offered, and met with slow sale at $2.30 to $4. The following figures give a general idea of the run of prices: Kentucky Steers, 1,486 lb at $5 70; do. 1,433 lb, at $5 20; Ohio do., 1,332 lb, at $5 60; do, 1,268 lb, $5 25; oxen, 1,514 lb, at $4 45; oxen, 1,265 lb, at $4 50; Bulls, 1,580 lb at $3 85; 6 do., 1,655 lb, at $4; Indiana steers, 1,120 lb, at $5 10; do. 1,119 lb, $5 10; Pennsylvania do., 1,021 lb, at $4 70; 10 do., 1,294 lb, at $5 45; 18 Indiana cows and bulls, 1,089@1,570 lb, at 3½@4c, Chicago steers, 1,122 lb, at $4 90; Mixed Western Steers, 1,316 lb, at $5 50.

CALVES—A few common to fair veals sold at 6@7c, and Grassers are quoted at 2@2½c.

SHEEP AND LAMBS.—Receipts for six days, 31,458 head, against 44,711 head for the same time last week. Choice lambs sold at fair prices, but Common were neglected. Sales of Common to Choice Sheep were at 3¾@5¾c., and Common to Good Lambs ranged from 4½@6¼c., with two carloads of Canadas sold at 6¾c. Canada lambs, 85 lb, at 6¾c.; Indiana sheep, 99 lb, at $5 20; Ohio sheep, 79 lb, at 4½c; Chicago sheep, 94 lb, at $4.75; Canada lambs, 80 lb, 6¾c; Michigan sheep, 95 lb, at 4½c; Kentucky do., 110 lb, at 4¾c; Michigan do., 79 lb, at 4½c; State sheep, 80 lb, at 4¼c; do, 89 lb, at 5¼c.

HOGS.—Receipts for six days 18,423 head against 47,670 head last week. Market firm and 5@10c. higher. Quotations $4.15@$4.30 for Common to Good Hogs. A few pigs sold at $3.35. Ohio hogs, 105 lb at 4¼c.; Roughs, 159 lb, at $3.25; 43 pigs, 85 lb, at $4.85.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.
It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.
AS AN EVIDENCE OF FAITH
in my remedy I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.
1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.
2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.
Facts are Better than Assertions.
Please read the following testimony:
GIBSONTON P. O., PA., Feb. 2, 1885.
Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, *as we would not risk feeding a pen of hogs without the Remedy.*
Yours very truly, WHITE & CO.
[N. B.—White & Co., since writing the above letter, have purchased $4.50 worth of the remedy.]
The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

GARDNERS' ALMANAC AND SEED MANUAL for 1886 free to all. This is conceded to be the most complete guide to the vegetable garden published. It contains prices of our RELIABLE SEEDS, full description for planting, etc., and a report from the market gardeners of Philadelphia who have used our Seeds.

For the Young.

SOME of the Cousins have been writing me about the tremendous squashes they raised last year. I have thought of away for them to make some money. The RURAL offers $10 for the largest Bird Canteloupe. Now can't you get your father to give you one or two seeds, or make you a present of a vine after it comes up? I believe you can. Then work at that vine the very best you know how. It may be that some of the smallest of the Cousins may bring out the biggest canteloupes. Let us try this now. Don't forget it.

The Cousins send in reports of very cold weather. We are all having a touch of it, I guess, even those of us who live in the South. That makes me speak of one thing I have noticed about cold people. These who hate to move away from the fire have the hardest work to keep warm. The best way to keep the blood in circulation is to jump about and make things lively. That is the reason people stamp their feet and slap their hands when their toes and fingers tingle. Keeping over the fire makes us tender and more apt to get cold when we have to go out. When I was a boy I had to go barefoot until quite late in the Fall. It used to be cold enough running through the frosted grass. I was glad enough to run and step on the places where the cows had been laying all night. People used to tell me to take a little switch and whip my feet. It made them tingle but I believe it made them more comfortable.

Now is the time when the hens ought to be kept as warm as toast. If they are standing about with frozen combs and legs, they will not lay many eggs, and I for one don't blame them at all. Some people think that animals only suffer when they are out in a bitter cold. I think it is just as bad for them in a damp or windy day. I know that I feel better on a clear, cold, day than I do when it is damp and rainy.

I hope the RURAL dogs will not have the hydrophobia. I don't believe any of them will. From what I can learn, our dogs must be pretty well behaved animals. I wouldn't let a dog lie with his head under the stove. It will make him lazy and stupid. It is a bad plan, too, to plague dogs. Sometimes they are taught to bite in this way. I know of a dog that was plagued by having his tail and hair pulled. He got so that he would snap whenever his hair was pulled. One day the baby put its little hand on the dog's side and Frisk snapped so quickly that he bit the baby's arm. I never thought that bite was really intentional, and yet the dog had to be killed. It pays to be fair and honest with animals. They know more than we think they do, and they will take their revenge when we least expect it.

How many of the Cousins have "spelling schools" in their districts? I used to go when I was a boy. I can remember the first one I ever went to. Our school drove over to another district and spelled against the school there. I don't think I had better tell you what word I missed. It was too easy. If I should tell you you would all say at once that you knew more than Uncle Mark did. How should I feel then?

Is there a wood-box in your house? If there is, I hope you are keeping it well filled. We never want to see the bottom of a wood-box. I should be very sorry to think that any of my boys are willing to have mother bring in wood herself, when they have such stout arms for playing ball and throwing snowballs. I would like to have all such boys go without dinner once or twice; then they would realize that something of the good things of life depends upon their own work.

WHAT THE COUSINS SAY.

MILLIE M. MYERS would like to get some subscribers for the RURAL, but says she is so little that she is afraid to try. These little people amount to a great deal more than they think. The largest people are not always the smartest by any means.

MARY B. BRETH lives on a farm where there is a Jersey red hog that will weigh 1,000 pounds when he is fat. It must be hard to tell, from the looks of it, whether it is a hog or a cow. They also have two bulldogs and nine cows.

NINA G. CLUTE writes about a poor little colt that seemed so weak and thin that her Papa wanted to kill it. Her Mamma took it and fed it on milk and oats. It is quite a nice colt now. That shows what good care and treatment will do.

LOTTIE E. STEVENSON says the people found a great many piles of hazel nuts piled up by the mice. One man found 14 bushels. I wish some of those mice would move this way and go to work.

BERTHA HEETER is ten years old and has seven studies. She can milk. They have two muley cows.

WALTER G. SMITH lives in Oregon. There are many Indian mounds near his home, in which people find spear and arrow-heads. What a life these old Indians must have led, so long ago. Ocean shells have been found out there on the tops of the highest mountains. How did they get there? When you come to know more about geology you will see how they came there. Years and years ago these high mountains were entirely covered by the sea. The waters slowly and slowly moved away until these great hills were left. There are high mountains at the bottom of the ocean now. New land is constantly being formed, and the great forces that have made hills and valleys are still slowly going on.

PHŒBE L. SHERMAN lives on an island near Washington Territory. That is far away from headquarters; still our club is large enough to cover the whole country. They have plenty of fruit, such as apples, pears, plums, peaches, prunes and cherries.

ROSA C. MILLER says she could do all kinds of kitchen work and sew on the sewing machine. She has a doll with four dresses which she made herself. She finds it very hard to teach the cats any tricks.

LOTTIE NOON lives in Illinois. She and her sisters have two pet lambs and a pet chicken. The dog, Carlo, is very playful. He will run after a ball when they roll it on the ground.

NELLIE R. DE COU enters the club from Iowa. She says they have had some awful blizzards out there. Think of 33 degrees below zero! Last Summer they had so much rain that the creek jumped out of its bank and washed the corn away.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I do not belong to the Y. H. C. but I suppose I may write you a letter, because I read the RURAL. I have no father to take the paper, for he died five years ago, before I was eight years old. I am the oldest of the children. Then Grandpa, who had no boys, took Mamma, brother Glenn, two years younger than I, little sister Arlie, baby Daisy and myself, all home to live with him. We go to school every Summer and Winter, work in the garden, pick up potatoes, and put wood in the wood-house. Brother Glenn likes to farm it, but I like to use the saw, hammer and plane. They call me the carpenter. We did not think Santa Claus would remember us, but on Christmas morning we found some candy in our boots, and in one of them was a letter from him in rhyme. It was dated in Chicago and was written on paper that had a picture of the Pacific Hotel on it, and contained two dimes, one for each of us. Perhaps some of the RURAL Cousins would like to know what he wrote us. It was this:

As I rode through town at reindeer speed,
Looking for all the children in need,
For girls and boys who liked to work,
Who told the truth, and would not shirk.
I spied two laddies hauling wood:
And I said I think those boys are good.
So I wrote their names in my gift book,
And on I sped, for more to look.
When I came back they had chopped the meat
That made the sausage fine to eat:
So I dropped a dime in each stocking toe,
And gathered up my reins to go.
But lo! the coins looked rusty and old,
So that their worth could never be told;
They had idle lain, so long a time,
They appeared no more a shining dime.
The boys might think them only a penny,
But use would make them as bright as any.
Idleness will every virtue dim,
Make pockets empty, and purses slim.
A shabby vesture and tarnished name
Are the results of the very same.

So here's a lesson, my boys for you,
The saying is trite but ever true,
If you dance the spring-time of life away,
In age you'll have but a cheerless day.
So work and study, 'twill make you bright,
Fit you the battle of life to fight,
And one thing more ere I take my flight,
The lesson is this; be sure and learn
All your dimes to save as well as earn
For when you are men, and in business start,
You will need some cash and a strong, brave heart.
—SANTA CLAUS.

Onondaga Co., N. Y. WIRT N. BISHOP.

[Your Grandpa is a good man to take care of you. Santa Claus gave us all some good advice in that poetry. We shall all remember it. Cash is good, when you can get it honestly, but a good character with plenty of perseverance and patience will be worth more. —UNCLE MARK.]

DEAR UNCLE MARK: We would like to join the Y. H. C. We had a Fuchsia that was frozen and hadn't any leaves on it, and we cut it half way down last Winter, and it began to bloom the last of July and did not stop until November. We had some very nice Petunias and three kinds of Tigridias, they were red, white and yellow. They did not do very well with us, we only saw the red one. They are very pretty, but only last one day. We had some annual chrysanthemums, but they were very small. It must have been a grand sight to see them in New York. We have a Yucca filamentosa that has never bloomed. How long does it take to bloom? We have a ageratum that bloomed all Summer; it was a Tom Thumb. We have plenty of Amaranthus and Verbenas. We had some very pretty tea roses, and perpetual and moss roses.

From your nieces,

Wheeling, W. Va. ANNIE AND GRACIE COOK.

DEAR UNCLE MARK: We had a very nice garden last Summer. We raised 300 quarts of strawberries from a bed containing two square rods. Our strawberries are the Sharpless and Great American. We also have red and black raspberries, red, white and black currants, cherries and some choice apples. We raised tomatoes kohl rabi, cabbage, lettuce, radishes, Hubbard and Summer squash, cucumbers, melons, beans, beats, onions, salsify, sage and summer savory. Our garden has been represented at the dinner and tea table since early Spring, and we often find ourselves wondering how people get along without a good garden. We found it more useful than ever at Thanksgiving. I have a small cabinet of curiosities. Some fine specimens of pyrites of iron; trinkets from the Centennial (brought me by my father) and from the New Orleans Exposition, a snake skin, a bullet taken from the shattered arm of one of Papa's friends in the late rebellion, are among the things in my cabinet. I am very anxious to get some good agates. Your niece,

L. MYRTLE PORTEUS.

St. Lawrence Co., N. Y.

[The table is a good place for the garden to send its representatives. There ought to be a good garden on every farm.—U. M.]

UNCLE MARK: May I join your club? My name is Hylon T. Plumb. I am a boy 11 years old, and my father keeps a nursery. I don't care about living on a farm or any such thing. I want to be a machinist. I make all of my boats and engines. I am at work now on an engine, which is to run by steam; I have it nearly done. I have a fine sail boat which is three feet long and two-and-a-half feet tall. I live very near the railroad track, and there is a pond of water a little ways from the railroad, on which I can sail my boat. There is a hill right side of my home, which gives me plenty of coasting, and there is splendid skating at the rink, but too much snow on the pond just now. Your nephew,

Rock Co., Wis. HYLON T. PLUMB.

[Yes, you may join. We need good machinists, and I hope you will surely be a good one. I hope some day you will be able to have a farm too. You will like farm work better then. I would like to see your engine. —U. M.]

DEAR UNCLE MARK: I live in the country, near a clear, running creek. I have a pet colt, four months old, named Belva, ten ducks, 15 guineas, a sow and six pigs. You may know I keep busy in cold weather feeding and attending them all. I love flowers. I have Wandering Jew and ivy growing. If you print this, I will come again and tell all about how I plant and cultivate my flowers in Spring. I have some beautiful grass bouquets for Winter. My father is a farmer and raises corn, cotton, potatoes and sorghum cane. I hope he will take your paper next year. I have two sisters older and three younger than myself, and no brothers. Haven't some of you a brother to swap me? Uncle Mark, if you ever come to Louisiana, I would be glad to have you call and see your little niece.

Ada, Grant Parish, La. MATTIE GRAY.

[We shall expect to hear more about the flowers. It may be that some of us have some extra brothers, but I hardly think they can be traded.—UNCLE MARK.]

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALCOM, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

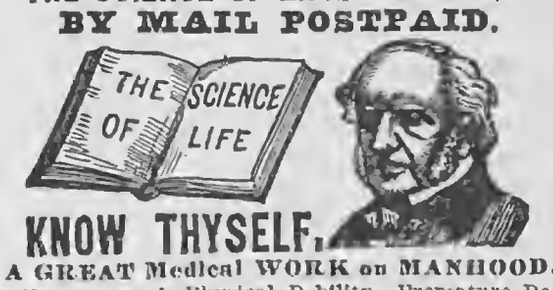
THE SCIENCE OF LIFE. ONLY $1.
BY MAIL POSTPAID.



KNOW THYSELF.

A GREAT Medical WORK on MANHOOD.

Nervous and Physical Debility, Premature Decline in man. A book for every man, young, middle-aged and old. It contains 125 prescriptions for all acute and chronic diseases, each one of which is invaluable. So found by the author, whose experience for 23 years in such has probably never before fell to the lot of any physician. 300 pages, bound in beautiful French muslin, embossed covers, full gilt, guaranteed to be a finer work in every sense—mechanical, literary and professional—than any other work sold in this country for $2.50, or the money will be refunded in every instance. Price only $1 00 by mail, postpaid. Illustrated sample 6 cents. Send now. Gold medal awarded the author by the National Medical Association, to the officers of which he refers.

The Science of Life should be read by the young for instruction, and by the afflicted for relief. It will benefit all.—*London Lancet.*

There is no member of society to whom The Science of Life will not be useful, whether youth, parent, guardian, instructor or clergyman.—*Argonaut.*

Address the Peabody Medical Institute, or Dr. W. H. Parker, No. 4 Bulfinch Street, Boston, Mass., who may be consulted on all diseases requiring skill and experience. Chronic and obstinate diseases that have baffled the skill of all other physicians a specialty. Such treated successfully without an instance of failure.

PERSONALS.

PROF. BAIRD says that a fair estimate of the annual product of the American fisheries would not fall short of $100,000,000.

THE late King of Spain is said to have been heavily insured in United States offices, presumably at extra heavy premiums.

THE Vicar of Masham, England, thus concluded a sermon to his flock: "And now, friends, which is it to be—Salisbury, Churchill and heaven, or Gladstone, Chamberlain and hell?"

A BLIND boy preacher, 16 years old, is causing some excitement in Raleigh, N. C. A week ago he told his father that he had received a divine command to preach the Gospel, and would be made blind for a period of some days. On January 13 he was smitten with blindness.

"YOU should visit the Supreme Court to morrow," Justice Bradley is credited with having said once, "for there will be some interesting arguments made. Mr. Sidney Bartlett, of Boston, is on one side and Mr. Roscoe Conkling is on the other; and one of them is a great lawyer!"

THE French Minister of Agriculture is about to establish several experimental farms in various parts of the country, in order to show the peasant farmer what can be done in his own locality. The yield of cereals in France is little more than one-third per head of the agricultural population of what it is in England.

MR. LABOUCHERE, of the London Truth, says that he has never met with more practical, sensible men than the Irish Nationalist leaders when not under the influence of temporary excitement. "I have," he says, "been greatly struck with their broadness of view, which contrasts advantageously with our supercilious mode of treating political opponents, our insularity, and our want of facility to grasp new ideas."

A PRETTY little correspondence is Mr. Gladstone's. Three thousand letters a month, 36,000 a year, 100 a day, is not bad for one man, exclusive, it would appear, of indefinite quantities of newspapers, circulars, post cards and the like. He ought to have a special postman, with a special Gladstone bag, to totter backward and forward with all this huge load of ink-stained paper.

JOHN NEITZ, a solid Dutch farmer of Upper Savern, Pa., is 70 years old and looks 40. He chews garlic as others chew tobacco, as he believes it a preservative of health and a prolonger of life. He has it cooked in everything he eats—even pie and puddings. His wife couldn't stand it, and as he preferred garlic to her, she packed up and left some years ago, and though she lives near the old homestead, the couple "never speak as they pass by."

GOV. HILL, of this State, in his address on being elected, the other day, President of the State Bar Association, protested that lawyers—well, some of them—charge extortionate rates. "They seem to regard it as their province," said he, "to demand all the client can stand and something more." "All the traffic can stand and something more," is the demand of the railroads.

Miscellaneous Advertising.

Last week we asked you to watch this space. Now, if you will write Hallett & Co., Portland, Maine, you will receive, free, full particulars about work that either sex, young or old, can do, at a profit of from $5 to $25 per day, and upwards, and live at home. All can do the work. Capital not required; Hallett & Co., will start you. Grand success absolutely sure. Write at once and see.

JOEL HORNER & SON, Merchantville, N. J.

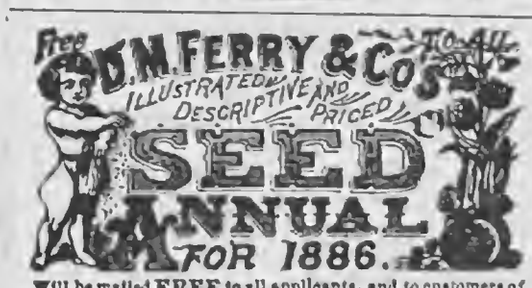
FAIR AND SQUARE DEALING.
Believing that if a man has dealt squarely with his fellowmen his patrons are his best advertisers, I invite all to make inquiry of the character of my seeds among over a million of Farmers, Gardeners and Planters who have used them during the past thirty years. Raising a large portion of the seed sold, (few seedsmen raise the seed they sell) I was the first seedsman in the United States to warrant (as per catalogue) their purity and freshness. My new Vegetable and Flower Seed Catalogue for 1886 will be sent FREE to all who write for it. Among an immense variety, my friends will find in it (and in none other) a new drumhead Cabbage, just about as early as Henderson's, but nearly twice as large! James J. H. Gregory, Marblehead, Mass.



Will be mailed FREE to all applicants, and to customers of last year without ordering it. It contains about 120 pages, 600 illustrations, prices, accurate descriptions and valuable directions for planting all varieties of VEGETABLE and FLOWER SEEDS, BULBS, etc. Invaluable to all, especially to Market Gardeners. Send for it.
D. M. FERRY & CO., Detroit, Michigan.

ONE OF OUR CUSTOMERS SAYS:
"I have dealt with your house for 20 Years, and I never had
SEED
that proved so good as yours."

Humorous.

A SWELL AFFAIR.—The soap bubble.

AN ARTIST IN BLACK.—A designing widow.

WHAT is the difference between a Catholic sister and a Catholic woman? Nun.

IN Siam the cats have their tails banged. In this country the entire cat is banged.

AND now Chicago claims that pork is a brain food, being a product of thousands of Western pens.

WHEN a person is in everybody's mouth he naturally has a high appreciation of the popular taste.

"Is-yer troubled with rheumatiz dis mawnin" Hannibal?" asked Scipio as his friend came limping up the walk. "Not zackly, Scipio," groaned Hannibal. "Ye see I woke up in de night with a ragin' appetite fur watermillion. Massa Jones's ga'den is close adjacem to de house, an'——" "Yah! yah! an' ye eat too much?" "Not zackly; but Massa Jones is a tolable fair shot, Scipio."

"WHAT becomes of men who deceive their fellow men?" asked a Sunday-school teacher of her class. "They lose the confidence of good people," was the prompt answer. "Very well, indeed. Now, what becomes of the women who do the same thing?" The question stumped the class for a minute, and then a little girl piped out: "They usually catches the man for a husband, mum."

A POPULAR minister was asked how it was possible for him to preach a new sermon every Sunday, year after year, and to find something new to say. "Doesn't it give you a good deal of thought and trouble?" "Oh, no," was the reply; "it is a mere matter of habit. My sermons have never kept me awake five minutes." "Ah!" said the other, "that, then, is probably the reason why they don't keep other people awake, either."

SOME lady visitors were going through a penitentiary, under the escort of a superintendent. They came to a room in which three women were sewing. "Dear me!" one of the visitors whispered, "what vicious-looking creatures! Pray, what are they here for?" "Because they have no other home. This is our sitting-room, and they are my wife and two daughters," blandly answered the superintendent.

SOUND ADVICE.

Mrs. McCarty: "Lay it an virry lightly, dockther; he's a foine, will shaped by, an' I wouldn't have um all milted up shure!"

Miscellaneous Advertising.

A good Baptist clergyman of Bergen, N. Y., a strong temperance man, suffered with kidney trouble, neuralgia, and dizziness almost to blindness, over two years after he was told that Hop Bitters would cure him, because he was afraid of and prejudiced against "Bitters." Since his cure he says none need fear but trust in *Hop Bitters*.

PROOF EVERYWHERE.

If any invalid or sick person has the least doubt of the power and efficacy of Hop Bitters to cure them, they can find cases exactly like their own, in their own neighborhood, with proof positive that they can be easily and permanently cured at a trifling cost—or ask your druggist or physician.

GREENWICH, Feb. 11, 1880.

Hop Bitters Co.—SIRS: I was given up by the doctors to die of scrofula consumption. Two bottles of your Bitters cured me. LEROY BREWER.

HOLSTEIN-FRIESIAN CATTLE!

ALL AGES AND BOTH SEXES. HOME-BRED AND IMPORTED.

Cows and Heifers Bred to best Netherland and Aaggie Bulls.

The average Records of a Herd are the true test of its merit.

The following Milk and Butter Records have been made by animals now in our Herd:

MILK RECORDS.

Five Cows have averaged over 19,000 lbs. in a year. Ten Cows have averaged over 18,000 lbs. in a year. Three Cows have averaged over 20,000 lbs. in a year.

We know of about 30 Cows that have made yearly records exceeding 16,000 lbs., and 14 of them are now in our Herd and have averaged over 17,500 lbs.

Twenty-five have averaged over 16,000 lbs. in a year. Sixty-three, the entire number in the Herd that have made yearly records, including fourteen 3-year olds and twenty-one 2-year olds, have averaged 12,785 lbs. 5 ozs. in a year

BUTTER RECORDS.

Five Cows have averaged 20 lbs. 7 ozs. in a week. Nine Cows have averaged 19 lbs. ¼ oz. in a week. Fifteen Cows have averaged 17 lbs. 6 ozs. in a week. Six 3-year olds have averaged 14 lbs. 8 ozs. in a week. Eleven 3-year olds (the entire number tested) have averaged 13 lbs. 2 ozs. in a week. Six 2-year olds have averaged 12 lbs. 1⅓ ozs. in a week. Fifteen 2 year olds (entire number tested) have averaged 10 lbs. 8 3-10 ozs. in a week. The entire original imported Netherland Family of six cows (two being but three years old have averaged 17⅔ lbs. in a week. This is the Herd from which to get foundation stock. Prices low for quality of Stock.

SMITHS, POWELL & LAMB,

LAKESIDE STOCK FARM, SYRACUSE, N. Y.

"ACME" PULVERIZING HARROW AND CLOD CRUSHER AND LEVELER

AGENTS WANTED

BEST SELLING TOOL ON EARTH

Subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning Process of Double Gangs of Cast Steel Coulters. Immense cutting power. Crushing, Leveling and Pulverizing performed at the same time. Entire absence of Spikes or Spring Teeth avoids pulling up rubbish. Only Harrow that cuts over the entire surface of the ground. Sizes, 3 to 15 ft. wide. With and without Sulky attachment. We deliver free at Distributing Depots.

FAIR PLAY. DO NOT BE DECEIVED. Don't let dealers palm off a base imitation or some inferior tool under the assurance that it is better. SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL. We will send a **double gang** Acme to any responsible farmer in the United States; if it does not suit, he may send it back, we paying return freight. We don't ask pay until tried on his own farm.

Send for pamphlet containing thousands of testimonials from 18 States and Territories.

Branch Office, HARRISBURG, PENN. NASH & BRO., Manufactory and Principal Office, MILLINGTON, NEW JERSEY.

N. B.—"TILLAGE IS MANURE" and other essays sent free to parties who NAME THIS PAPER.

SCIENTIFIC GRINDING MILL

THE BEST MILL ON EARTH

For Grinding Ear Corn, Shelled Corn, and all Small Grains. Grinding Plates a special metal, hard as steel. Have double capacity, as they **sharpen themselves** on being reversed. Fully Guaranteed. Send for illustrated Catalogue.

THE FOOS MANUFACTURING CO.,
SPRINGFIELD, OHIO.

Eastern Branch Office, 216 North Broad Street, Philadelphia, Penn.

A SAFE FAMILY REMEDY.

ESPECIALLY SUITED FOR

BABES,

CHILDREN AND DELICATE PERSONS.

TROPIC FRUIT LAXATIVE

Entirely harmless and delicious to take. Tropic Fruit Laxative is unequalled for Constipation, Biliousness, Sick Headache, Loss of Appetite, Complaints of Children, and liver, stomach and bowel ailments generally.

Absolutely safe for delicate and nursing women. Taken eagerly by infants and children.

Ask for **Liquid Tropic-Fruit Laxative.** Price 25 cents per bottle. *Sold by Druggists.*

ORGANS The most beautiful and finest toned in the world. Low prices, easy payment. Send for Catalogue. Address Weaver Organ & Piano Co., YORK, PA.

THE WILLIAMS

Grain Threshers, Horse Powers and Engines.

Highest prize awarded these machines at the New York State Agricultural Society's latest trial, over a large number competing.

Ample warranty and opportunity for trial given. For full particulars address

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1880. NEW YORK, FEBRUARY 6, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Horticultural.

THE EVERGREEN BLACKBERRY.

We show this week faithful drawings of the Evergreen Blackberry about which some discussion was held in the RURAL a few months since. These illustrations were made from a vine sent us by Mr. W. J. Sears, of Walla Walla, W. T. This vine was one year old and measured 14 feet in length. Mr. Sears states that owing to the dry season of last year the berries shown are smaller than usual. Fig. 50 shows the shape and size of the berries, and Figs. 51 and 52 (pages 86 and 87) show the leaf and vine growth. The following notes explain themselves.

From CHARLES A. GREEN.

About five years ago a friend in Oregon sent me a few plants of this variety, stating that it was discovered by a sailor on an island in the Pacific Ocean. The plant succeeded well and bore a moderate quantity of fruit the third year. It has a trailing habit of growth, spreading a long distance over the ground, and propagating from tips. The foliage is unlike that of any blackberry I have ever seen. It is cut into fantastic forms, and remains green with us throughout the Fall and Winter, probably for the reason that it does not seem to be affected by the late frosts, and, lying so close to the ground, it is partially protected. Where the canes extend upward for two or three feet the leaves turn reddish, but are retained—do not drop off. It did not bear fruit in sufficient quantities to indicate that it could be cultivated with profit, and the berries were too acid for my taste, therefore, I did not continue to propagate it. It has been growing on our place every year since. It possesses great vigor and seems to be hardy and enduring. I consider it of more value as an ornamental than as a fruit-bearing plant.

Recently, parties have been offering the Evergreen Blackberry, and advertising it through the press. It is claimed by the parties who are introducing it that it is of excellent flavor, enormously productive, exceedingly hardy, etc. In passing over the fields the past season, I found several branches bearing fruit, which was of fair size, and quality. I have never yet seen a bush bearing a crop that would pay to pick. As an ornamental plant it is attractive, and very many would be pleased to have it growing on their grounds as an ornament, but for fruit I do not consider it of much value. While the foliage generally remains green all Winter, a portion of the bush that is most exposed will become beautifully tinted as Autumn approaches and the bush is certainly a thing of beauty.

Clifton, N. Y.

From W. J. SEARS.

As some appear to think there is no such thing as an evergreen blackberry, since we have the genuine Evergreen here, I deem it no more than justice to our Territory that the merits of the plants be shown. They are nothing like the Cut-Leaf Blackberry. These were brought on this coast from the South Sea Islands a few years ago, and have proved themselves very hardy where other kinds kill down every Winter; but then we have other fruits that are natives of warm climates that do well in all parts of the United States—the peach, for instance. This is not as mild a climate as many Eastern people seem to think; for the mercury often goes from 20 to 30 degrees below zero during the Winter, and again it will be very warm for a week or so, and that is what kills our berries throughout the whole of Eastern Oregon. If the Evergreen Blackberry stands the weather here (and it does), it will do so in Colorado or any of the Eastern States. Then again, it is an abundant bearer and a little later than other varieties—say two or three weeks—and the berries are about like those of the Lawton in size, color and flavor—some say a bit sweeter and others about the same. I am not interested in the sale of the Evergreens, only I like to see justice done to all parties, and if our men from this Territory are selling the genuine Evergreens and delivering them genuine there, it is no swindle.

Walla Walla, Wash. Ter.

From S. S. WALKER.

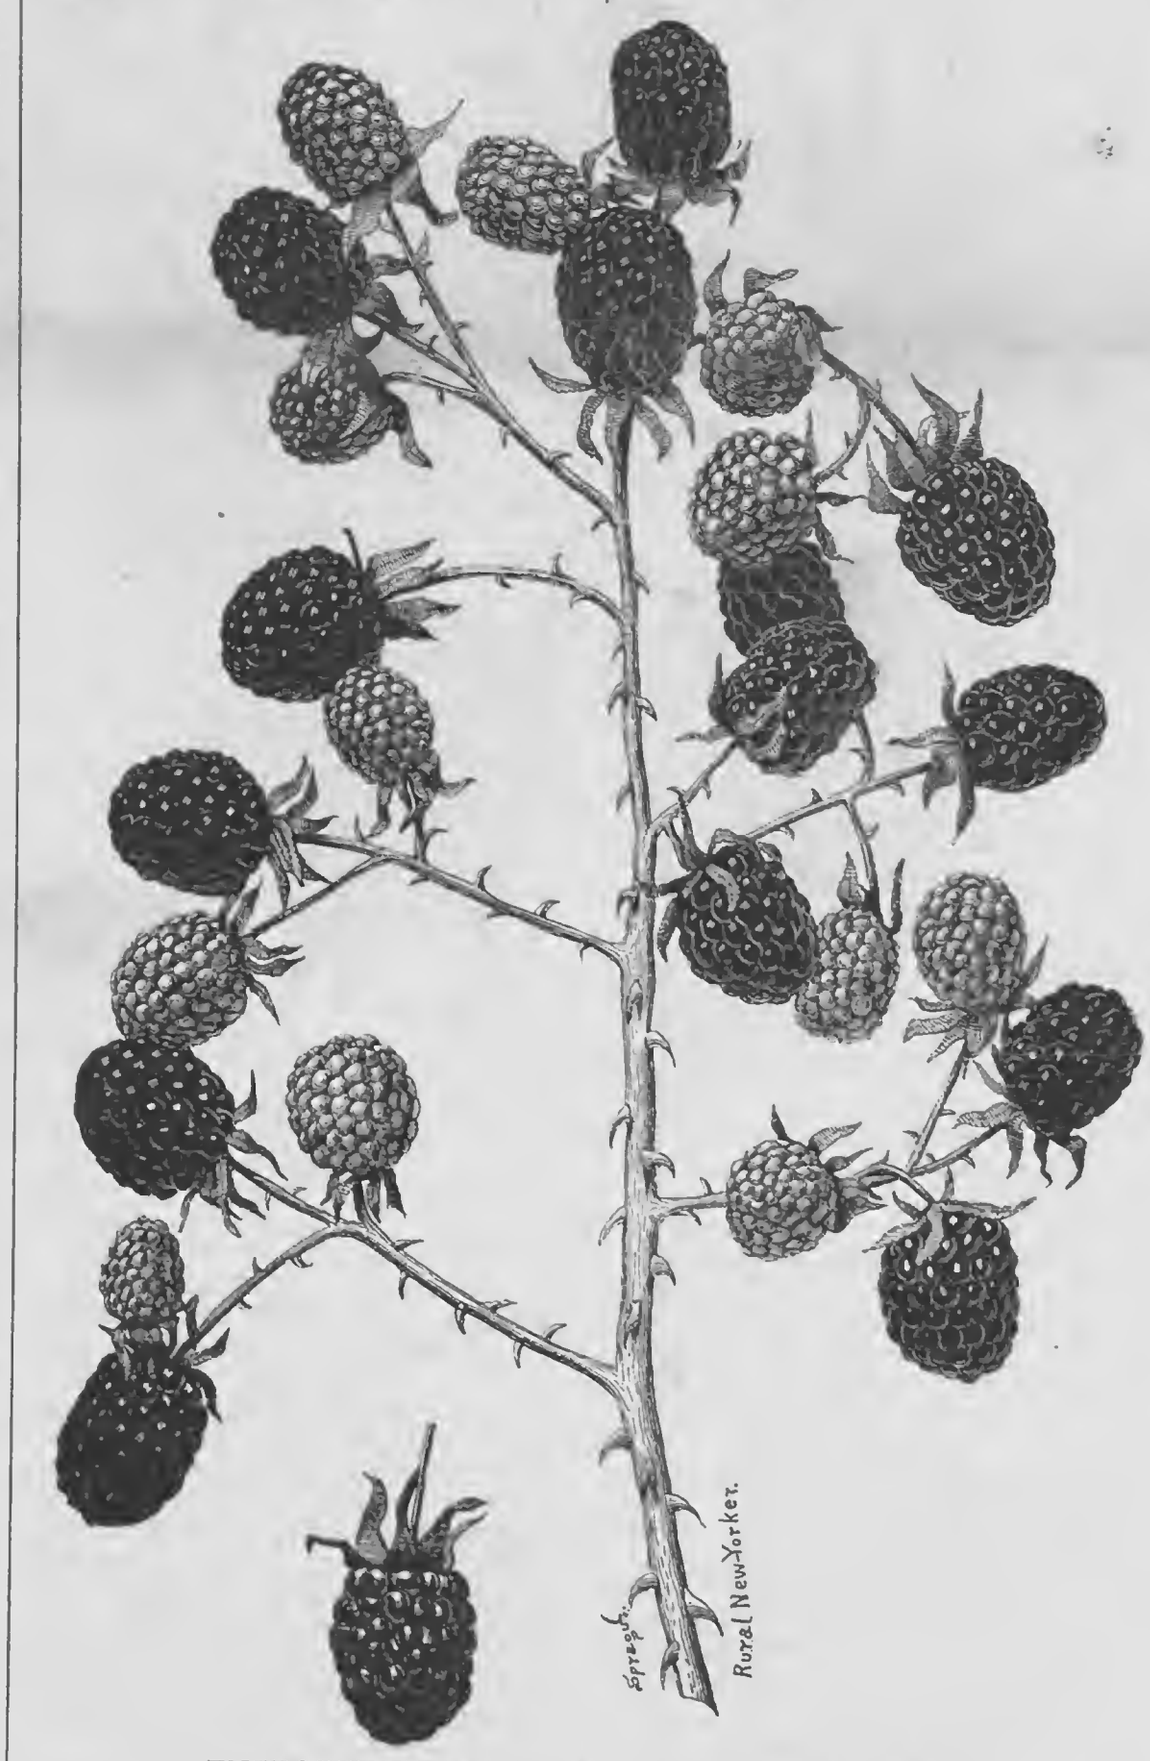
I believe that the Lawton and Kittatinny Blackberries are considered standards for quality and productiveness where they can be grown to perfection; but two-thirds of those who have either of these growing beside the Evergreen will give their preference to the latter. A man who had carried both 25 miles in a carriage, told me that while the Lawtons were all jam when he reached home, the Evergreens were in good shape. Still, no one should pay too high a price for them. The variety is worthy of a trial.

Forest Grove, Oregon.

From O. DICKINSON.

I have sent the Evergreen Blackberry to nearly every State in the Union, and I shall hear next Summer how it stood the present severe Winter, and also of its growth last Summer. To the present time, I have not heard of a single loss on account of the cold.

Salem, Oregon.



EVERGREEN BLACKBERRY. From Nature. Fig. 50.

From W. ASHWORTH & Co.

The Evergreen Blackberry is nothing like the old "Cut-leaf." There are millions of them growing wild hereabouts all through the woods, and instead of the Evergreen being the Rubus fruticosus—as the RURAL called it—it is the Rubus fructuosus—(? EDS.) We can get plenty of testimonials from different parts of the Territory that they are genuine Evergreens, very hardy and the most prolific in bearing of any of the berry family.

Seattle, W. T.

From PHILLIP RITZ.

I brought to this new Northwest 29 years ago, from Long Island, what was known as the Parsley-leaved Blackberry. It proves to be an evergreen here, and is now known as such. The vine is trailing and bears a nice, sweet berry, not quite so large as the Kittatinny.

Walla Walla, W. T.

Experiment Grounds of the Rural New-Yorker.

SPRAYING BELLOWS.

IN the way of labor-saving contrivances there is nothing that has given us greater satisfaction than the Woodason spraying bellows which are now sold by most seedmen. There may be other spraying apparatus that will serve better, but not having seen or tried them, we speak only of that which we can commend from experience. A single minute is long enough to spray every part of a hen house 10 feet square, perches, roof and all. Kerosene is used and answers every purpose of whitewashing, which requires much time and labor. For spraying small patches of cabbages with Buhach or Pyrethrum powder mixed with water, to rid them of the cabbage worm; or currant bushes with hellebore, to rid them of the currant worm, there is nothing more efficacious. It is tiresome, however, to blow the bellows, so that where a large number of plants or bushes are to be sprayed, spraying pumps may be preferred. There are other bellows made for the distribution of dry Buhach or hellebore powder. It may, of course, be extended with flour or plaster as desired.

The RURAL began the use of these bellows years ago, and through its commendation they are now used and greatly valued by many. There is little about them to get out of order and their durability may be estimated by the fact that a single pair of bellows has served us for five years and is now as good as ever.

BUHACH.

This is the powder made in California from the flower petals of the Pyrethrum cinerariæfolium. When first offered for sale, the manufacturers sent a box of it for trial to the Rural Grounds. It was claimed that it would kill every form of insect life—a claim which we found to be but partly true. Nevertheless, in many cases it seems to us the most desirable insecticide at present known. We tried it upon flies, mosquitos, plant lice, caterpillars of various kinds, beetles, cabbage worms, squash bugs, potato beetles and their larvæ, tomato worms, currant worms, and finally upon the rose bug. Our reports have appeared before RURAL readers from year to year, showing that, with the single exception of the potato beetle, it has proven more or less effectual with all.

If used dry, it may be mixed with several times its bulk of flour. But we prefer to mix it with water in this way: Take, for instance, an ounce of Buhach; *wet* this with alcohol and stirring it until it becomes muddy, add two quarts of water. This may then be poured into the reservoir of the bellows as needed and thus sprayed upon the infested plants, or if poured into a pail, any of the several kinds of force-spraying pumps may be used. The bellows, however, will be found much handier where but small quantities are required. It is said that a pound of Buhach

preferably first wet with alcohol) will bear the addition of 50 gallons of water, and still kill the insects which receive the spray; but we doubt it. It may be that the imported Pyrethrum powder is just as economical an insecticide as the California Buhach. Never having tried it, we speak only of that which we have tried, and that, too, with much satisfaction. Last year, for the first time, the Buhach was sprayed upon the spiræas growing here, which of all plants the rose bug attacks first. Though the bushes were *alive* with these bugs, in 10 minutes after the spraying not one was to be found, some having flown off, the others dropped to the ground where they seemed to wriggle either in agony, a sort of palsy paralysis or drunkenness—it was hard to say which. Dwarf apple trees, grapevines and other plants were subsequently sprayed with the same effect.

As is well known, this pyrethrum powder is utterly harmless except to insect life.

RURAL LIFE NOTES.

THE NEW CELERIES.

MUCH is written and said of late concerning the comparative merits of the newer varieties of celery. Henderson's White Plume has received praise from some quarters and condemnation from others. Such, after all, must be the lot of every new vegetable product that dares raise its head in these days. Tastes differ widely; conditions of soil, location and cultivation are diversified. Man develops better and enjoys better health in one locality than in another; and the sooner a like existing principle is recognized with respect to the vegetable kingdom the better. A writer in the London Garden finds two varieties of the White Plume—one a tall, upright grower, the other low and spreading. The last he obtained from an American seedsman under the guise of "Improved White Plume." "Get the original" is his advice, the other being much inferior. For the second season I am pleased with the White Plume. The flavor is good, the celery is attractive on the table, and it keeps pretty well. But it is not a vigorous grower with me, and is liable to rust. I lost some from this cause last season. It also inclines to rot if earthed up early. Although it may be used without earthing up at all, the blanching is more perfect where the soil has been drawn up against the stems for a time.

* * *

I am also pleased with the New Rose Celery. It grew vigorously and without a particle of rust. I am inclined to regard this as one of the best for general culture and family use. It is hard, very brittle, and crisp, the stems breaking easily when handled. In flavor it is excellent. It has, however, but little of the rose tinge, only a few of the stems showing it. Mr. Henderson is doubtless right in saying that the difference in flavor in celery is due more to condition of growth than to variety. But the red sorts differ from others and are usually better.

The plan of packing in a deep box in a cellar for winter use, the roots resting on a few inches of soil, is a good one. I shall, however, cover the roots with soil next time, as mine is wilting just a trifle now.

* * *

ECLIPSE BEET.—This is a poor acquisition, as it comes from my garden eclipsing all predecessors in lack of flavor. It is no sweeter than the Egyptian, and not worth growing except for its handsome shape and appearance. If in beets for the table fine quality means sweetness, then we have few sorts fit to grow. The Early Bassano seems the best so far. If flavor is no object, and only a flabby mass of tissue that will cook tender is wanted, then almost any of the new early beets are good. But I am always troubled with the notion that beets ought to have a sweet flavor. Possibly conditions of soil and growth are elements to be considered.

* * *

WINDOW TRAY.—For window-plant culture, after trying various methods, I find the best plan is to have a tray in which to set the pots; placing them upon about an inch of clean sand. The tray catches the drip and saves the carpet, while the sand holds the moisture longer and keeps a healthful degree of humidity in the atmosphere which is essential to personal inmates as well as the plants. My tray is of heavy galvanized iron. I have the tin-man take a sheet of full width and cut it off as long as wanted for the width of the window, or a little more. Then let him turn up the edges all around at right angles with the bottom, making the tray about two inches deep and twenty inches wide; and then have him solder the corner neatly and strongly. If desired, the upper edge could be wired, which would make it stiffer and more finished, but it is not necessary. Such a tray is inexpensive, durable. Mine does not rust, and it will be found well adapted to the purpose. Some 30 or 40 pots can be placed in it, depending of course upon size of pots and plants. They can be easily watered, even sprinkled with a fine rose nozzle, by the exercise of a little care, and many plants will thrive under these conditions, that are apt to fail or die when kept isolated in pots and saucers on a shelf by themselves. This tray should stand on a table about the hight of the window sill; then if desired to get at the front side, the whole may be moved out together. A shelf on brackets about half way up the window will hold another row of pots, the drip from which is caught in the tray. Then if one has still a few other plants which cannot well be crowded in the tray, the movable iron brackets of the shops may be screwed on at the sides of the window, especially if it be a bay-window, and some fine flowering specimens may thus be conspicuously accommodated and displayed. The whole forms a miniature, impromptu conservatory, easily arranged by anyone and with very little money.

* * *

HOMES.—I wish everybody had a home. It's a grand thing to have, and I say this not forgetting the thousands of unhappy homes, yes, miserable homes that exist in every land. Take away the influence radiating from the homes of any community, and the moral and social atmosphere of that place would soon become appalling. How very little it usually takes to make home happy, and yet, how many either forget or refuse to do even that little. A bad temper is nowhere else so virulent as in the home; and yet a single ray of genial sunshine flung in at the right time—and any time is the right time—will shatter the impending cloud, and avert the storm. Oh, let us be cheerful in our homes. Deal gently with the weak, the irascible, and the doleful members of the family. But never forget to scatter smiles and sunshine. Don't let the children see long faces or hear angry words. If I could prevent just this one thing in every family that reads the RURAL, it would be glory enough for me.

* * *

Now who wants a chrysanthemum flower that measures seven inches in diameter, or a plant of the species eight feet in hight? Such were shown at the last exhibition in New York. This tendency toward monstrosity and colossal proportions in the garden is growing detrimental in its prevalence. Massive fruits, flowers and vegetables usually attain such abnormal proportions at the expense of quality and flavor. Surely we have nothing to sacrifice in these respects. Let us stop all this horticultural jugglery to make things big, and go to work honestly to make them better. But let us make quality the first consideration.

H. H.

On-the-Hudson.

EVERGREEN BLACKBERRY. From Nature. Fig. 51. (See first page.)

Sheep Husbandry.

Notes from the Rural's W. N. Y. Farm

LAMB RAISING AND FEEDING LAMBS.

NEW AND OLD PROCESS MEAL.

OUR old friend, J. D. Stannard, of Wisconsin, asks at what price will oil meal cease to be a profitable food for sheep?

Several others ask what is the difference between old and new-process meal, and which is the better as a sheep food? Another inquires how should oil meal be fed?

These questions open up the whole subject of the manufacture of oil meals and their comparative value with each other and with other feeding stuffs. Oil-cake meal, and oil meal (the old-process), and linseed meal (the new-process), are all made from flax seed, resulting from the extraction of linseed oil. The best brands by either process are made from selected seed, such as does not contain over five per cent. of "fouls"—other seeds and foreign matter. In both processes the seed is first cracked or ground, by the same machinery and in the same way. In the old process this ground seed is first heated and then subjected to immense pressure which expresses from 88 to 91 per cent. of the oil, and along with it, from three to five per cent of the albuminous matter. The solid hard cakes left by the presses are then ground, making the meal sold as oil or oil-cake meal. In the new-process the cracked seed is placed in large tanks holding about 300 bushels, and from this the oil is dissolved and washed out with a solvent which takes from 97 to 98.7 per cent. of the oil, but has no effect upon the albuminoids. The meal is then subjected to the action of superheated steam which expels the last trace of the solvent. It is then subjected to the action of heated air which expels the moisture, when it is ready for use. According to the average of all the American analyses, at hand, of the two meals, they contain as follows:—Of albuminoids or flesh, wool and milk-formers, the old-process has 30.26 per cent., the new-process, 35.61 per cent.; of carbohydrates, or fat and heat-formers, the old-process contains 38.13 per cent., the new-process 36.48 per cent. Corn has an average of nine per cent. of albuminoids and 68 per cent. of carbohydrates.

Figuring the values of all these by the German valuation, which, though much too high is as fair for one as another, the comparative values of 100 pounds of each would be as follows:

OLD-PROCESS MEAL.

30.26	pounds albuminoids @ 4½c. per pound	$1.31
38.13	" carbohydrates @ 9-10c. " "	.34
	Total value of 100 pounds	$1.65

NEW-PROCESS MEAL.

35.61	pounds albuminoids @ 4½c. per pound	$1.54¼
36.48	" carbohydrates @ 9-10c. " "	.29½
	Total value of 100 pounds	$1.84

INDIAN CORN.

9	pounds albuminoids @ 4½c per pound	$ .39
68	" carbohydrates @ 9-10c. " "	.61
	Total value of 100 pounds	$1.00

In these estimates, the value of one per cent. fat is reckoned as equal to 2.4 per cent. of carbohydrates.

These figures make the ton value of each, counting corn as worth $20, or one cent per pound:—Old-process meal, $33; New-process meal, $36.80. These estimates do not take into account the value of the manure for use upon the farm. This to the good farmer who desires to maintain the fertility of his fields, is a matter not to be lightly passed over, so that we should take the value of the manure made in the consumption of the various food when deciding which is the most profitable to feed. We must also consider this when considering at what price linseed meal ceases to be profitable. Without giving exact figures, it is safe to say that the manure resulting from feeding a ton of linseed meal is worth at least three times as much as that from a ton of corn, so that if we take $3 as the fair value of that from the corn, then that from the oil-meal would be worth $9, and at least $6 should be deducted from the price of the meal.

Let us suppose a case as the basis of a calculation. Suppose corn to be worth, in the market, 28 cents per bushel or $10 per ton; then the new-process meal would be worth $18.40; to this we should add $6 for the superior value of the manure from it. This would make it a profitable food at $24.40 per ton.

From our experience in the use of oil meals as a stock food and of the manure resulting therefrom in the production of crops, we are very sure not one-half as much is used as would be profitable.

JOTTINGS.

We recently bought a large lot of culled beans (those picked out in hand-sorting), for which we paid $6.15 per ton. We cook them, and after they are cooked, add a small proportion of corn meal and a little bran, and they make the best kind of hog food. On this food we are now feeding 100 hogs.

With such cheap food, and with warm, dry quarters, there is not the least difficulty in making pork and selling it even at the very low price of $4.50 per 100 pounds, and making a large margin of profit. It is no experiment, as we have done the same thing before.

We have not the least fear but that good, nice, well fattened shoats, weighing from 200 to 225 pounds, will sell, about next June, at from $5.50 to $6.00 per 100 pounds, and at that price we shall double our money.

But the best of it all is that the manure is worth 50 per cent. more than the beans cost, so that if we did not make a cent in feeding the hogs, we should still count the whole transaction a very profitable one.

In buying feeding stuffs we always have due regard to the amount and value of the manure their consumption will leave available for use upon the farm.

While we have great faith in commercial fertilizers and would not say aught against their use, we still give the palm to such manure as we make on the farm. There should be thousands more doing the same thing.

Dairy Husbandry.

CANADIAN DAIRYING.

A fair attendance; dairying as a specialty; progressive dairying; possibilities of the dairy; kinds of cheese wanted; dairy buildings; practice of a successful dairyman.

[RURAL SPECIAL REPORT.]

THE Dairymen's Association of Western Ontario met on January 13th, and continued its sessions until noon of the 16th. As an admission fee was charged, the attendance might be considered large and the interest was certainly intense.

Mr. F. Malcolm favored dairying as a specialty, as against mixed husbandry. Even in mixed farming, dairying is the most profitable branch. But conditions must determine the line of farming. Those who go into dairying, where the conditions are against them, will make a failure. Farms in the dairy districts of Ontario are rated much higher than equally good ones in districts where mixed

farming is carried on. Any business which is able to establish a special market and draw buyers from all parts is able to command better prices than one which depends upon the general market.

Rev. W. F. Clark favored progress in dairying. The management of the cheese factory has improved faster than the production and delivery of milk. Dairy farmers lack thoroughness. He favored carrying instruction right to their doors. First, hold free conventions in the towns of the dairy districts, where their best home talent could reach the factory patrons and instruct them in the requisites of successful dairy farming. Second, employ experts and allot to each 18 or 20 factories, and make it the duty of the experts to regulate everything about the factories and extend their labors to the farms and herds of the patrons, correcting evils and giving the required instructions for producing the best milk and delivering it in the best condition. This idea was favored by the convention and bids fair to be carried out during the coming season.

The possibilities of dairying were presented by Mr. Thomas Shaw. There should be a more scrupulous honesty permeating all the details of dairy farming, and a higher standard for the dairy herd. Dairymen should bring their troubles to these conventions and submit them to the scrutiny of all present, who will be most likely to throw some light on the means of remedying the troubles in the future. The dairyman who does not encounter and overcome obstacles is not progressive, and he who is not progressive is sure to be left behind in the race. There is inexcusable meanness in the practice of dishonesty by the patrons of cheese factories, who not only inflict a degree of evil on themselves, but a much greater one on their unoffending and perhaps unsuspecting neighbors. Improvement in dairy farming is not for the benefit of the factories alone, but for the greater benefit of the farmers themselves, who will reap the reward of increased receipts.

The kinds of cheese wanted and the kinds not wanted were pointed out by Mr. John Robertson. Those not wanted are stiff, dry, curdy, soft, pasty, loose, open-cutting, bitter, sour, strong-flavored, a variety of sizes in the same factory, and that made from dirty, tainted or skimmed milk. Too much rennet, tainted rennet, too little rennet, too much or too little heat, too much acid, bad condition of the herd, rank flavored food, variable temperature in the curing room, whey-soaking, uncleanliness, carelessness and all kindred causes tend to the production of these objectionable qualities in cheese. The kinds of cheese wanted are mellow, silky, meaty, solid-textured, fine-grained, rich, pure, nutty or creamy flavored, shapely, clean, smooth-rind and uniform-sized cheese of 60 to 70 pounds weight. This kind of cheese is made from wholesome, clean milk, with a proper amount of sweet rennet, even and sufficient, but not too much heat, fine and even cutting, gentle stirring to prevent adhesion of the lumps to each other, avoidance of too much acid, warm make and press room, even temperature in the curing room and scrupulous care and neatness at all points.

Prof. L. B. Arnold dwelt upon the importance of properly-constructed dairy buildings, and gave a description of the one lately erected at Cornell University as a model. It is comparatively inexpensive, but by the use of building paper is provided with four or five dead-air spaces in the walls, which render the interior practically free from the influence of changes in the outside temperature. He also exposed the poor economy of employing cheap cheese makers when the best can be had at reasonable wages. A single sale often realizes the difference in wages for the entire season. He also deprecated the hurry so often manifested by cheese makers to get their work off their hands, thereby prematurely rushing the curds to press when they ought to be curing in the vat or sink.

Mr. D. M. Macpherson runs 66 cheese factories in Eastern Ontario. He is studying to get rid of the exercise of judgment as much as possible on the part of the cheese maker, and reducing everything to routine practice. In the first place, he is careful to have correct thermometers, finding those in common use vary from two to ten degrees. He sets his milk at 80 to 86 degrees, according to temperature and season; takes one hour for coagulation fit to cut; cuts fine and even, and is one hour steadily raising the temperature to 98 degrees—not above, as he considers it injurious. As soon as the curd will string the least bit by the hot-iron test, he draws the whey; he piles up the curd and cheddars in the vat, frequently cutting it in quite small pieces, and turning it to facilitate the separation of the whey: when it will spin a half-inch on the hot iron, he grinds the curd; he then lets it stand an hour and air, keeping it warm, but frequently stirring it; then he salts the curd and lets it stand another hour exposed to the air before he puts it to press. The pressing is light at first and very gradual.

Mr. Robertson, Jr., follows the rule of having his curd coagulate ready to cut in as many minutes as he wants it days to be curing and ready for market, that is to say, if he desires the cheese to be fit for market in 30 days, he puts rennet enough in his milk to complete the coagulation ready to cut in 30 minutes; this, with his system of handling curds, produces about the desired result every time.

The subject of the sanitary arrangement of the factory was discussed; the health officers are taking hold of the subject to remove offensive pig-styes, whey vats and leaky spouts that scatter the whey in inaccessible places that cannot be cleansed.

On the whole, the Canadians appear to be more widely awake to the necessities of successful dairying than are their neighbors in the States. "C."

The Poultry Yard.

SOD-HOUSE FOR POULTRY.

THE best winter-laying my hens ever did was when they lived in a "sod-house." (See Fig. 59). A pen was built and a door-frame was set into it on the most sheltered side and sods built over and around it, making the foundation about three feet broad. Earth was liberally heaped over all, and a ventilating tube, 8x10 inches, was set in the top like a chimney. The most successful cheap contrivance ever used for saving the little pitiful chicks is a hole dug in the ground, not over eight inches

EVERGREEN BLACKBERRY. From Nature. Fig. 52. (See first page.)

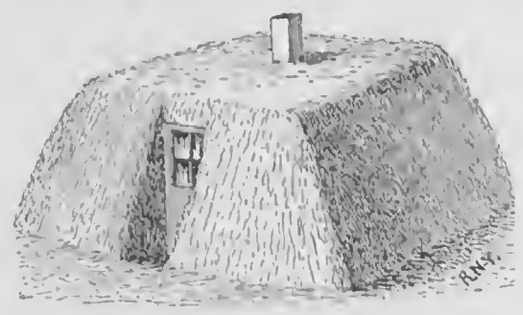

Fig. 59.

deep. A box, with an opening on the most sheltered side, is set over the hole, and the entire thing is snugly banked up with earth. (See Fig. 60). Put one brood in each place of the kind and feed with screenings and crumbs from the table, and see how well it pays. If you give them drink enough they will not be stunted in size. An old salt barrel, sawed in halves, or, for small fowls, even a nail keg, laid on its side in the hole and banked up, or sods built up around it, will answer well.

Fig. 60.

MRS. E. S. LINCOLN.

FIVE GOOD LAYERS.

IN the Fall of 1884, I purchased five pullets and one cockerel of the Plymouth Rock breed. The hens averaged 7¾ pounds and the cock weighed 11 pounds. There was also one egg in the coop when they arrived at the express office, which showed their good will: and from the first of January, 1885 to the 31st of December, 1885, they layed 1,051 well-developed eggs, or 210 1-5 per hen. In January they layed 38; February, 76; March, 92; April, 136; May, 102; June, 94; July, 112: August, 94; September, 90; October, 71; November, 60; December, 86; the record was kept each day. If the readers of the RURAL wish, I will draw plans of our hen-house, and explain how I feed chickens. [Certainly.—EDS.] J. T. W.

Decatur, Ind,

Entomological.

THE MILDEW OF THE GRAPE-VINE.

AN EFFECTUAL REMEDY FOR PERONOSPORA.

PROF. C. V. RILEY.

(*Continued.*)

SULPHUR as a means of checking or remedying this particular mildew has proved a failure, and indeed no satisfactory remedy has until recently been found, though prophylactic means, such as those recommended by Mr. Wm. Saunders, namely, the sheltering of the vines by a board covering over the trellis, have been more or less successful.

The fact that no satisfactory remedy existed until lately was well illustrated by the discussion which followed the reading of a paper by Mr. F. S. Earle, at the meeting of the American Horticultural Society, at New Orleans, last February, on "Fungoid Diseases of the Strawberry.* The concensus of opinions was that we have no remedy for most of the fungus diseases of plants. That this was, unfortunately, a true state of the case, practical cultivators will admit; for, though intelligent treatment will check the growth of the black knot and the proper use of lime and sulphur will check Erysiphe and Uncinula, these are about the only fungus diseases which we can control with satisfaction and certainty. Prof. G. C. Caldwell is reported to have stated about a year ago, at a meeting of the New York Horticultural Society, that mildew could be prevented by soaking the stakes in the vineyard in a solution of blue vitriol; but as that report does not specify which mildew was intended, I know not how authoritative it is.

During my visit to South France in the Summer of 1884, I was struck with the prevalence of this Downy Mildew in most of the vineyards, and the French grape-growers around Montpellier felt far more anxiety as to the consequence of this peronospora than they did as to the work of the Grape-vine Phylloxera. They feel now that with the aid of our American stocks they can control and defy this underground pest; but the peronospora, which was a few years ago unknown to them, but which has been introduced with the American vines, has so far entirely baffled them, as, I believe, it has baffled our own grape-growers.

In an address which I had the honor to deliver before the Central Society of Agriculture of the Department of Hérault in June, 1884, and which treated principally of insecticides and insecticide appliances, I took occasion, in view of the interest then felt in this mildew, to recommend the use of the following as a promising fungicide: The ordinary milk-kerosene emulsion prepared after the formula given in my late official reports as U. S. Entomologist, with from two to five per cent. of carbolic acid and the same percentage of glycerine, and then diluted in 20 to 50 parts of water to one of the emulsion and sprayed onto the under surface of the leaves by means of a cyclone nozzle of small aperture, so as to render the spray as fine as possible. The suggestion of the carbolic acid was due to the results obtained by Prof. Gustav Foëx, Director of the Ecole Nationale d'Agriculture at that place.

It was very gratifying to find this recommendation at once acted upon, and, up to the time when I left Montpellier, with satisfactory results. Reports of further trials showed also that this mixture so sprayed at once arrests the spread of the mildew. I was well aware of the difficulty of dealing satisfactorily with a fungus which may, in a single night, without any warning, manifest itself all over a vineyard; but it is a great point gained to know how to check it, even if the knowledge may at times be of little practical avail in large vineyards. But much good nevertheless resulted, and "*Le Procédé Riley*" was much written about in *La Vigne Americaine* and other viticultural journals a year ago. However, the experience of the past year in France has furnished a remedy which, from all accounts, is in every way satisfactory, because it not only destroys direct, but acts as a prophylactic.

My attention was drawn some months ago to two articles by C. B. Cerletti published the 15th and 30th of August in the *Revista di viticoltura ed Englogia Italiana*, announcing the success of hydrate, or slaked lime. My friends, M. J. Leichtenstein and P. Viala, of Montpellier, the latter having charge of the *Labaratoire de viticulture* at the *Ecole Nationale d' Agriculture de Montpellier*, soon thereafter communicated to me the discoveries made. M. Velicogna in a report in the *Actes et Memoires de la Societé imperiale et royale d Agriculture de Gortiz*, for September and October, 1885, has also discussed the effect of hydrate of lime at length, his formula being 2½ kilogrammes of the lime (chaux éteinte) in 100 liters of water.

The general tone of the experience with this hydrate of lime is satisfactory, but with a mixture of hydrate of lime, and sulphate of copper is still more conclusive, and numerous communications to viticultural journals and to the French Academy attest the complete efficacy of the remedy. It has been the custom in some of the wine-growing parts of France to sprinkle lime and verdigris upon those vines which border on the roadside, as a means of warding off depredators. It was found that vines so spattered were not infested by Peronospora, while the rest of the vineyard might be attacked. This discovery led to further experiments.

Various formulæ have been given, but the most important articles are those by M. A. Perrey in the *Comptes Rendus de l'Ac. d. Sc.* Oct. 5, 1885, and by M. A. Millardet in the same publication and reproduced in the *Messager Agricole du Midi* for Nov. 10, 1885. From this latter article I condense the following: Dissolve eight kilogrammes (18 pounds) of ordinary sulphate of copper, in 100 litres (about 22 gallons) of any kind of water (well, rain, or river), in a separate vessel. Mix 30 litres (about 6½ gallons) of water, and 15 kilogrammes (about 34 pounds) of coarse lime so as to make a milk of lime. Then mix with this the solution of sulphate of copper. These will form a bluish paste. Pour a portion of the mixture in a bucket or other vessel, thoroughly shaking it, and brushing the leaves with a small broom, taking care not to touch the grapes. There is no fear of any accident, not even to the most tender portion of the vines.

The treatment was made from the 10th to the 20th of July. At some points the operation was repeated a second time at the end of August, but without much advantage. It was therefore demonstrated that one application was sufficient.

The mixture, when dry, sticks very fast to the leaves. After the vines were treated there were several showers the beginning and end of August, also the frequent September rains, notwithstanding which the evidence of the efficacy of the treatment, where no more than half the leaves were touched by the mixture, could easily be detected. That this remedy will prove effectual for the many other similar white mildews on other plants, caused by other Peronosporæ, there can be little doubt.

The same fear of danger as to the effect of this fungicide on the vine and on the wine, has been experienced in Europe as we experienced in this country in the early use of Paris-green as an insecticide, and experience alone will settle the amount of danger there may be in the use of this new remedy.

*Many writers on mycological subjects misuse this term "fungoid" (which means something not a fungus, but fungus-like) in speaking of true fungi or of a fungus diseases.

BIBLIOGRAPHY.

I know of no one who has more fully recognized the practicable bearings on the best method of dealing with these two fungi than Mr. Wm. Saunders. In the Report of the Commissioner of Agriculture for the year 1861, p. 495, ff., he has an article: "Remarks on Grape Culture, with reference to Mildew, both on the native and foreign varieties," and in a number of subsequent reports, as those of 1864, '65, '66, '67, '69, '81-2 and '83, he has dwelt either at length or incidentally on the essential facts that the Uncinula is encouraged by a dry atmosphere and the Peronospora by a moist atmosphere. His experience shows that the nature of the soil or mode of cultivation has but little influence on the fungus and that protection from above as by covered trellis, is about the best prevention of the Peronospora; also that grape-vines with downy foliage are more susceptible to the Peronospora than those with smooth foliage. His experience is very well summed up in a statement of it furnished for publication in my 5th Report on the Insects of Missouri, p. 70 (foot-note).

Of the writers on the structure and development of these mildews, Dr. Thomas Taylor was one of the earliest in this country, and found the perithecium of the Uncinula on the European vine. His chief articles are contained in the Reports of the Department of Agriculture for 1871 and 1874, but are marred by confusion in both text and plates. For accurate details the student should more particularly consult the following:

W. G. Farlow (whom I have mostly followed) "Notes on Some Common Diseases Caused by Fungi," (Bull. Bussey Inst. Vol. II, part II., 1877, pp. 106-114); also "On the American Grape-vine Mildew (ibid. for 1876, pp. 415-425); Maxime Cornu, "Le Peronospora des Vignes," Paris, 1882; B. D. Halsted "The White Mildews" (Proc. 19th Session Am. Pom. Soc., for 1883, p. 87); and Wm. Trelease, "The Grape Rot," (Trans. Wis. Hort. Soc., 1885, pp. 196-199.)

SUMMARY.

We thus have, indigenous to this country, two mildews that are more particularly destructive to the grape-vine:

1. The Uncinula spiralis, or the Powdery Grape-vine Mildew, flourishing most in a dry atmosphere, not particularly destructive to our hardier native grapes, and easily controlled by the use of sulphur. It develops chiefly on the upper side of the leaf, and produces simple, ovoid summer spores and more complex and ciliate winter spores, which are found upon both the leaf and the cane. Introduced into Europe many years ago, according to trustworthy evidence, it is only known there in the conidial form as Oidium Tuckeri, and works more injury than it does with us.

2. The Peronospora viticola, or the Downy Grape-vine Mildew, which ramifies its mycelium in the substance of the leaf and even of the fruit, and develops most in moist or wet weather. It produces its summer spores on the underside of the leaf, and a winter spore in the tissues of the dry and fallen leaves. It is not amenable to sulphur, but is checked by a diluted kerosene emulsion in which a small amount of carbolic acid is mixed, but far more effectually checked, and even prevented, by a mixture of slaked lime and sulphate of copper. This should be applied early in the season, say in June, so as to act as a preventive, while the gathering and burning of the old leaves in winter time will assist. This species is more injurious with us than the other, and is especially troublesome on the European vines. It was first introduced into Europe in 1877, when it was found in Hungary, and has since spread through the greater portion of France, Italy, Switzerland, Austria, etc.

Pomological.

TWO RARE PEARS.

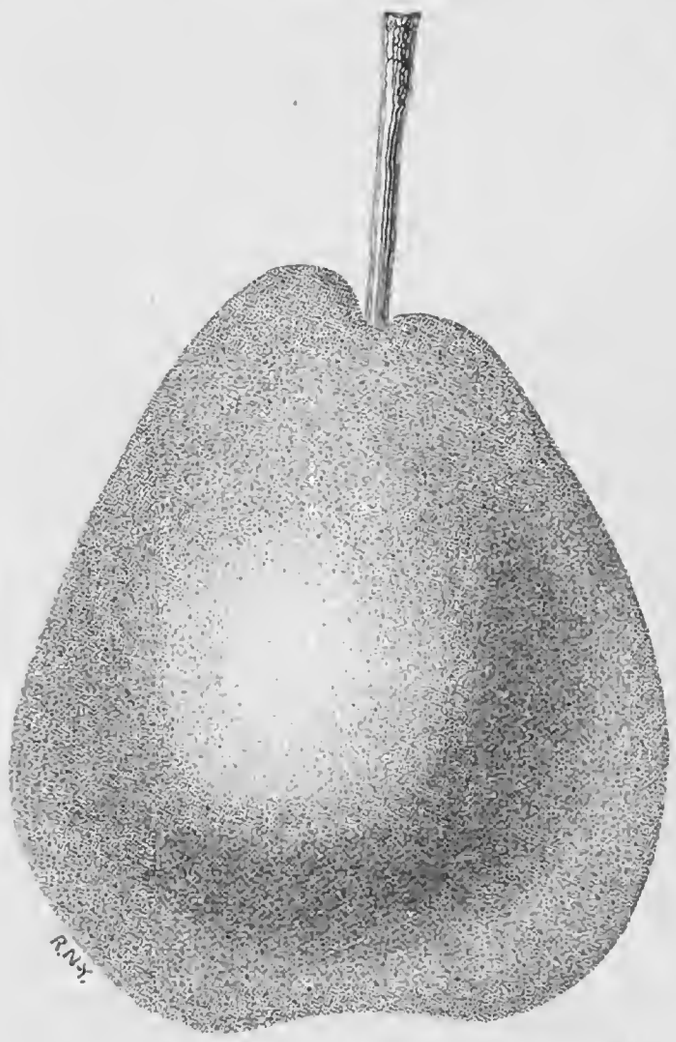
GEN. W. H. NOBLE.

THE Hericart and Omer Pacha pears are both French, and both September pears—early September and last of August. Their season is over, and all, out of a refrigerator-house, have vanished or become worthless by September 15th. They may be set down as about two weeks ahead of the Bartlett. Although the number of good September pears is "legion;" yet I think there is room for these two large, fine-fleshed, aromatic and luscious pear.

The trees are both healthy and very fair growers. I have never known the leaf or any other blight to touch them. The Omer Pacha throws out its limbs very regularly and squarely. But those of the Hericart (see Fig. 55, with cross-section at Fig. 56,) are somewhat straggling. It needs some interior pruning. Since the trees began to bear in their early fruitage, they have never failed to give me a crop. The Hericart is rather apt to over-bear. Although every pear, even windfalls, are good, yet, like all others, the fruit is improved by thinning.

The Omer Pacha (see Fig. 57, page 89, with cross-section at Fig. 58, page 89), like the Beurré Bosc, sets its fruit at such judicious intervals that it saves that duty, so sure, on most trees, to give us better pears.

For market their size and fine quality make them very desirable. We want no more small September pears unless they can rival the Seckel in all that makes it the queen of its race. In fact, I think the most anxious search should be for large and later pears and those keeping like apples joyously while "Winter lingers in the lap of Spring."

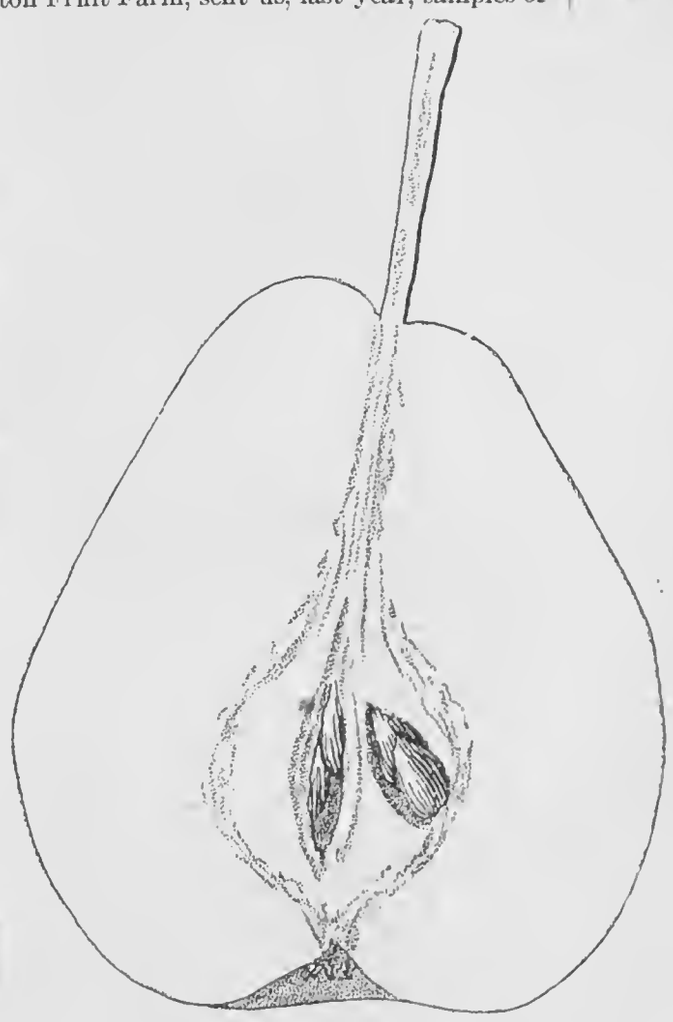


HERICART PEAR. From Nature. Fig. 55.

In this search and watch, large pears, of good keeping qualities, should always be had in mind. Short of the high qualities of a Dix, or an Easter Beurré, and close up to their size, we should not give our hearts to many pears of any season. The markets will not pay for small fruits when big ones can be had, of anywhere near equal merit.

THE GLOBE PEACH.

MR. CHRISTOPHER SHEARER, of the Tuckerton Fruit Farm, sent us, last year, samples of



HERICART PEAR. Cross Section. Fig. 56.

the above-named peach, which we illustrate at Figs. 65 (p. 90) and 66. The samples sent were very large and oblong with a prominent apex considerably pointed. Skin considerably downy, lemon-yellow with a fine, mottled-red cheek. Suture well defined, but shallow, 9½ inches in circumference. Flesh, yellow with a deep shade of red about the pit, juicy, sweet, rich and melting: a very good flavor, but not the highest. October 2 it was in fine order; a great improvement over the Late Crawford. Leaves large and healthy, heavily veined, but entirely free from glands, quite pointed, but not deeply serrated.

Mr. Shearer states that this peach is an accidental seedling with him, and has proved so profitable that since he has learned its value he has grown it in preference to all other varieties. He has trees of this sort 12 years old, and still healthy and vigorous. The tree is a rapid and vigorous grower, well adapted to our climate, and is an excellent bearer, sometimes breaking down with an excessive load of fruit. In ordinary years these peaches measure from nine to ten inches in circumference, and in favorable seasons from 12 to 14. It begins to ripen in the second week of September, and lasts till the first of October.

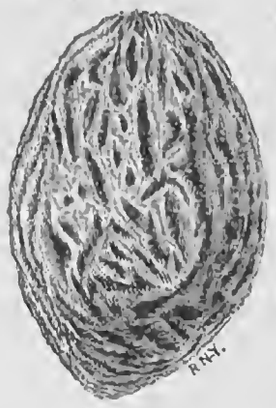


Fig. 66.

MEECH'S PROLIFIC QUINCE.

A LETTER FROM MR. W. W. MEECH.

NOW that the RURAL is satisfied that Meech's Prolific Quince "is plainly *not* the Champion," I need not again recall their points of difference. I did not say in my letter that the RURAL NEW-YORKER decided that the Champion and Angers were the same, but having been told so, asked you if that was the fact.

You think the attack on my quince was made by the judges at Mt. Holly rather than by the RURAL NEW-YORKER. I beg leave to differ with you. In the official report of awards at that fair my name with quinces is in the list of "honorable mentions," and it was all they could do for me as Meech's Prolific was not in the premium list—I was assured by an oversight.

You ask "Is Meech's Prolific a distinct variety?" I answer, "Yes, as distinct as other varieties." After the discussion of this variety at the late meeting of the New Jersey Horticultural Society, I asked Mr. P. M. Augur, the Pomologist of the Connecticut State Board of Agriculture, if he ever had seen in any fruit catalogue or heard any name for a quince answering to the description of Meech's Prolific, and he said he had not. I have not yet found any one who has given me any other name for my quince.

Chas. A. Green says, "I have reason for believing Meech's Quince to be an improved type of the Orange."

You inquire after the history, and how it comes to bear my name? It is mine by right of discovery. I never claimed to originate it. Being a special student of quinces and their culture, I have tested all the sorts I could get, and by their comparison have found this superior to all the rest. In sympathy with the opinion of Mr. Green as to its origin, I called it the Pear-shaped Orange Quince until my horticultural friends said this was not distinctive enough, as there were so many pear-shaped quinces, and that it was most suitable it should bear my name. To this suggestion I acceded, adding Prolific, its most prominent characteristic. That is how this "acquisition to the quince family" so long in obscurity and without a name known to the horticultural world, has come to be known as Meech's Prolific Quince.

The writer of the letter on the "True Story of Meech's Prolific Quince" tracing it back to Ohio some 20 years ago, stated in the discussion at Trenton, that he had also traced it to New York and Connecticut, all of which may be true. The man from whom I obtained my original stock, had it in Connecticut in 1857; but with no specific name, and it was probably carried to New York and Ohio, as he, and perhaps others, brought it to New Jersey.

It is unaccountable to me that so valuable a variety should be so long unknown to horticulturists; and that when I had discovered, tested, and made known to them its superior merits, and when some of them had attached my name to it as the disseminator, there should be so many to question the propriety of its bearing my name.

By the rules of the American Pomological Society "the originator or introducer (in the order named) has the prior right to bestow a name upon a new or unnamed fruit." Should the question of priority arise between different names for the same variety of fruit, other circumstances being equal, the name first publicly bestowed will be given precedence." Having settled on the merits of this quince as a new variety, I asked Mr. Downing as to the propriety of sending it out with my name attached as had been proposed; and he replied that he saw no objections to it, and so it has gone forth to the world.

Finally, if it be an old variety and bearing trees are found well scattered, even then I know of no stock to warrant your charge that trees can be bought at less than my price.

Vineland, N. J.

[We have cut out what we deem unimportant matter from Mr. Meech's communication and present the above in justice to him. Our own views remain unchanged. So let the matter rest. EDS.]

Farm Economy.

A FEED-BAG FOR HORSES.

WE give two illustrations showing a good form of feed-bag for horses, and one that can easily be made by anyone. With this in use the position of the feed in the bag is controlled by the horse moving his head up or down.

The feed-bag, see Fig. 54, as will be seen,

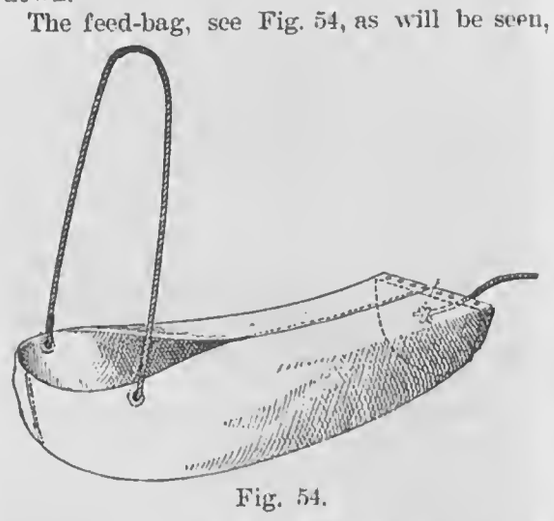

Fig. 54.

consists of a cylindrical canvas bag, or other suitable material, one end of which is closed by a semi-circular block of wood, tacked securely to the canvas. The other end of the bag is closed by a seam. Upon the upper, outer end of the feed-bag is formed a longitudinal slit through which the horse's nose passes. The main portion of the bag may be formed from a single piece of cloth sewed together along the upper edge, the opening being formed simply by leaving an open place in the seam.

A cord is secured to the wooden inner end, and is designed to be tied to the hames or saddle, in supporting the bag at its inner end. A similar cord is attached to each side of the nose end of the bag, and passes over the head of the horse. This cord should be short enough to hold the horse's nose within the slit in the bag.

Its application is clearly shown at Fig. 53 (p. 89). The position of the bag when the horse's head is down is indicated in dotted lines. The length of the bag should be sufficient so that when the head of the horse is in its forward position, the bag will not be stretched tight.

A DOUBLE HARROW.

ALTHOUGH it is hardly the time to use harrows, now is the time to get them in order for Spring work. I found the four-horse harrow, shown at Fig. 61, very useful last Summer, as it saved a hand to drive and, as I thought, did

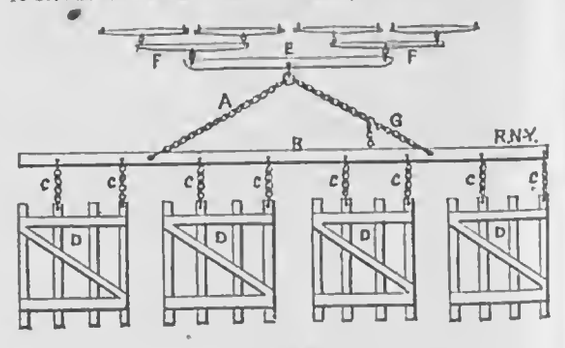

Fig. 61.

better work; it certainly is a fast way for it will take 16 feet at a cut. I take two common harrows (D D D D), with four beams in each section, bore a hole through the end of every other beam, and a corresponding one in the draw bar (B); then take short chains (C C C), put a bolt in the last link on each end (being careful to have all the same length), and fasten as in the figure, using a clevis at the draw bar. The chain (A) has a ring in the center to which the double-tree (E) is fastened. G is a short chain fastened to B, and ending with a hook. A stay chain is what I use. By lengthening or shortening this short chain the movement of the harrow is changed so that the harrowing is coarser or finer. The more the chain is lengthened the straighter

the implement draws, and consequently the coarser the harrowing. By shortening the drawbar and taking off one section, it can be made into a three-horse harrow.

Champaign Co., Ill. GEO. WHITON.

A HOME BINDERY.

MOST readers are loth to cast aside valuable papers. Those who do so lose more than half the value of the year's subscription. The best papers are intended for study as well as for reading. The trouble with most persons is that binding is expensive, if done by a regular binder, and unsatisfactory if done at home. I have a method of binding my own papers and pamphlets which I find very cheap and substantial. I arrange the numbers in regular order, with the back edges and one end as even as I can get them. With an awl I pierce three holes, as shown at the numbers in Fig. 63. These are large enough to admit the passage of a darning needle, and are made, say half an inch from the back margin. Now, with a darning needle, strong wrapping twine is passed down through the hole at 1, across and up at 2, down at 3, up again at 2 and across to 1, after which it is tightly drawn and tied.

Fig. 63.

If there are covers to put on, take a piece of stout cloth—as brown drilling—the length of the volume, and wide enough to cover the back and come an inch or so on each side. If there are two covers, one may be pasted on the outside and one on the inside of the cloth, so that when pasted on the book the edges of the covers shall be about half an inch from the back corner. With good paste fasten the back thus prepared on the back edge of the volume. From some poster or advertisement cut the name of the paper and paste it on the side or back and the book is complete.

Canyon City, Col. L. J. TEMPLIN.

GARDEN TROWEL.

THE trowel shown at Fig. 62 was made by our blacksmith from an old cross-cut saw, and is a little heavy. He furnished the steel and charged 50c. for making it, I having to polish

Fig. 62.

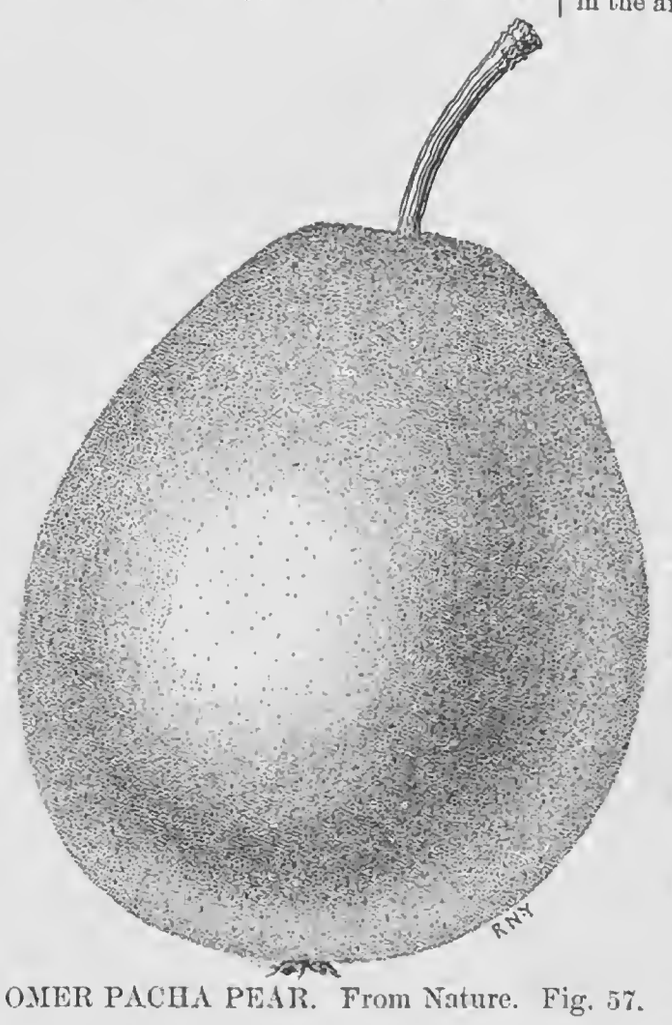
it myself. It is very strong; in fact, I very much doubt if a man can break it by prying on it. In some kinds of work a good, stout handle, three or four feet long, can be inserted and save stooping over. Thus fixed it is fine for working around shrubbery, taking up strawberry plants, digging holes for transplanting, etc. S. T. W.

Forest Grove, Or.

What Others Say.

OUR HOGS.—The statistician of the Agricultural Department gives the average number of hogs in the United States during recent years as about 44,000,000. The average number for Europe is about 49,000,000. Our country contains 55,000,000 inhabitants, Europe over 300,000,000. In other words, there are, in this country, 80 hogs to every 100 inhabitants, while in Europe there are but 15 to every 100. Our average exportation for 25 years has been 530,000,000 pounds or nearly 3,000,000 hogs. These figures show that the European consumption of pork is relatively small, that over supply may easily become a glut, and that an increase of production in these countries may seriously affect our trade, while an increased consumption would at once be felt in our markets.

LIQUID MANURE.—The Agricultural Gazette says English farming in some sections has reached a point where the losing of liquid manures may mean ruin. It appears strange that while liquid manure is known to be the most valuable, most of the time spent in devising means for handling and utilizing has been devoted to the management of solids. We know the composition of liquid manures, but few can tell the amount yielded by the animal or how different foods affect its quality. It is well known that when the animals are fed upon certain substances, such as vegetables, silage, or other succulent matter, the quantity of urine is greatly increased. Doubtless the inferiority of certain manures is at least partially made up by the increased quantity and quality of urine. How to save such an unmanageable article is a great problem. Where many cattle are kept it will surely pay to construct drains leading to a pit or cistern, into which the liquid may run. We know of one farm where this product is conducted to the basement, into a hogshead, set on wheels, where it can be dragged out and sprinkled over grass land. Absorbents, such as sawdust, sand, straw, moss or sea-weed can be used to save much of this valuable product—too valuable by far to run to waste.

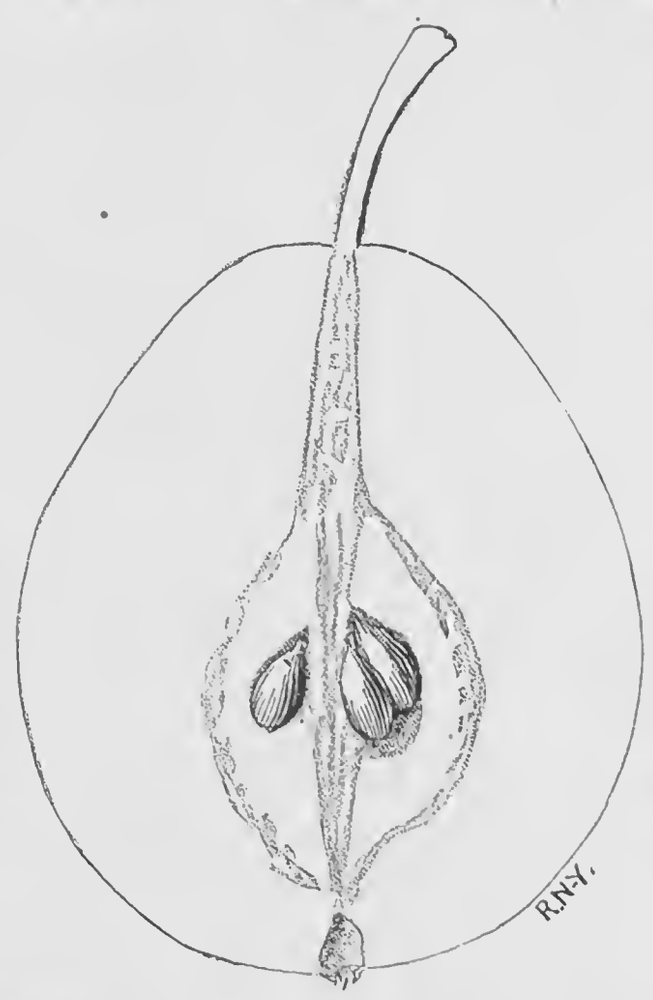


OMER PACHA PEAR. From Nature. Fig. 57.

POINTERS.

THE Japan Cercis or Judas Tree is a beautiful shrub or small tree—but not always hardy at the Rural Grounds.....

REMEMBER the Quercus Concordia or Yellow-leaved Oak. We have had a specimen of this for ten years. It is now ten feet in hight,



OMER PACHA PEAR. Cross Section. Fig. 58.

having been cut back once. The young leaves are of a bright yellow. This is lost in Summer, returning somewhat in the Fall.....

CERCIDIPHYLLUM JAPONICUM has a leaf somewhat like the Cercis. It is a very hardy tree so far as we have tested it. The young leaves are purple.....

THE Pendulous Conus Florida is said to be compact in habit, which cannot be said of the species. The main shoot grows up, the side branches downward.....

THE new Variegated Red Dogwood bears leaves margined with yellowish-white. The young leaves have also a tint of red. It is a desirable shrub, but one is enough.....

THE Fastigiate Oak grows like a small Lombardy Poplar and the foliage remains intact until early Winter. It is not quite hardy at the Rural Grounds.....

THE Purple Myrtle-leaved Elm is of dwarf habit and well suited to grounds of small extent.....

PUCK says: "There are two sides to the bread question, farmers," shouted a political speaker, "and my record shows you which side I stand upon." "Yes," replied a voice," the buttered side."....

ART can beat nature every time, says Thomas Meehan; but only those who take pleasure in the art can do it.....

THE American (Nashville) calls clover the "elixir of agricultural life."

THE N. Y. Tribune remarks that it is most true, as quoted from the Rev. Mr. Bushnell, that the high culture of the few does not elevate the many: and that benefactions to collegiate institutions would be greater benefactions to any country if applied to the humbler cause of universal elementary training in work as well as in words.

AS an illustration of the safety to the stomach of using water that has been well boiled the same paper mentions a case of water used in a stoneware bottle and heated on cold nights as a bed-warmer. Being left in the bottle all Summer slightly corked, it was found wholly unchanged in appearance when Winter came again..

OUR friend Mr. Hale of Conn. says that the Kieffer Pear suggests in quality "a cross between a quince, a squash and a seed cucumber." We do not think such extreme comparisons fair. The Kieffer is better than a quince, squash, cucumber or any conceivable combination of them.....

THE Editor of the Industrialist of the Kansas Agricultural College feels a good deal of sympathy for the proprietors of advertisements, which he occasionally sees, who end their announcements with the terse observation that "no notice will be taken of postal cards." The Editor has observed that the man who writes about stock upon a postal rarely buys. Still, we do not see why inquiries or requests, not of a private nature, may not be written upon postal cards.....

OUR esteemed contemporary, the Florist, gives a fine colored plate of the new rose, "Her Majesty." It also presents a life-like photographic portrait of Peter Henderson.....

GOOD points from the Breeder's Journal: The nearer water is to the temperature of the body, the less heat is wasted in assimilating it. Profits waste with the heat. Never feed frozen roots to stock. Give the calves more oats. Do not turn the cows that are in-calf out on to slippery places.....

THE English grain crops are the wonder of the world, and yet they do not pay to raise. Reasons, high rents and foreign competition.....

A CORRESPONDENT of the London Live Stock Journal holds that live-stock will still be the mainstay of British agriculture. He proposes to produce more "baby beef" and "baby mutton." England cannot compete in the number of cattle, for her area of available land is limited, but she can strive for early maturity and choice quality.....

To help in reducing England's $50,000,000 butter bill, he suggests the keeping of more of the smaller butter breeds near towns and cities. A Jersey cow that would feed on the lawn with a little extra feed, would keep the family in milk and butter..

A COW knows enough to rest after eating a hearty meal. How many human beings are equally intelligent?

WHEN the farm begins to run down, the boy runs to town, says Prof. Roberts.....

BREEDING for disease may be described as using an unsound animal for breeding purposes, or subjecting pregnant animals to cruelty in any form. The list of diseases thought to be hereditary constantly increases as science probes into the matter. The young is so much a part of its parent that any derangement of the blood of the latter cannot help being transmitted.....

MR. T. B. TERRY, writing from Milton Junction, Wis., to the Albany Cultivator, says that though he does not wish to speak ill of his own town, he wishes he could select a hundred acres in Southern Wisconsin, and place them around his Ohio home. He would show some crops that would be worth looking at.....

WHAT to Major Alvord seems most necessary for dairymen and friends of dairymen, as he expresses himself in the Farm Guide, is for them to stop their complaints and expressions of fear, with the accompanying cries for help to protect them in their honest labors from some terrible enemy. Instead of this, they should make their business and product such that it need fear no competition in the form of a substitute or adulteration.....

THE Saskatchewan, spring wheat (so called) is spoken well of by many.....

THERE is a *weeping* variety of the Purple Beech.....

Plant the Colorado Blue Spruce, Try the Imperial Cut-leaved Alder. Have you the red-flowering Horse-chestnut?.. :.....

CHAS. A. GREEN says in the Weekly Press, of Philadelphia, that the fields, woods, flowers, fruits, rocks and hills are the best of teachers to a receptive mind, and all the processes of growth and all the operations of agriculture enforce lessons of patience, industry, economy and hope.....

MR. GREEN thinks that the phenomenal success of Cornelius Vanderbilt, the elder, and his son in accumulating a fortune, is worthy of study. It was not accidental. These men had well defined plans and methods, which they adopted in early life, and Mr. Green believes it was their experience on the farm that was largely instrumental in forming those purposes and fixing those habits which commanded their surprising success. To this the editor replies that the farm is a good school for a boy, but of the millions who attend school only one Vanderbilt is evolved in a generation—and the world might worry along if there were none.....

SOME ONE has said that old people should never sleep with children. The argument has been that the vitality of the child would be absorbed by the older person. Dr. Hoskins says this is most absurd. People do not grow poisonous as they grow old. The good grandmothers, who so love their children's offspring, and take such sweet care of them, should not be made the victims of a gross and groundless superstition.....

OUR friend, the Western Rural, says that a lazy man ought never to get married. Home duties are too exacting for laziness. It is the husband's duty to assume a full share of the labor that is by many supposed to be peculiarly the wife's.....

IT further says that the average theory of home life is that the happiness of home depends solely upon the wife. She is advised always to have the husband's supper ready and hot. It seems to be supposed that she has married a stomach; and we admit that the stomach appears to be all there is to some men.....

"THE bull is half the herd." Yes, and often only half. The cows represent the other half. If hey are scrubs, their half will be plainly evident.....

THE Poultry World says that the great success attained in developing the Plymouth Rock and Wyandotte breeds has greatly encouraged the making of new varieties. Dozens of men are quietly at work building up new breeds.....

H. S. BABCOCK sums up the good qualities of the Plymouth Rock. Its peculiar plumage is pleasing to the eye. It has a satisfactory figure—solid without being clumsy. Considering size, structure and flesh, it is as good as any breed for the table. It is hardy. It adapts itself to all circumstances. By nature it is tame.....

THE London Live Stock Journal speaks of four hens that live in a small basket on the wagon of a strolling pedlar. When a halt is made the hens hop down and forage, and thus pick up part of their living. We know of a small flock of hens that lived on a construction train in the West, and kept the cook well supplied with eggs. The hen is one of the best friends the farmer knows.....

THE English papers are discussing the much-vexed question relative to the determination of sex in offspring. They do not seem to come much nearer any real solution of the question. A great deal of conflicting evidence has been brought out. It has even been stated by some that pullets or cocks can be produced at will. A writer in Gardening says that, from his experience, he should advise those who wish to hatch pullets (1) not to use the eggs from young birds for hatching, but from more matured ones; (2) not to have less than eight or nine hens with each cock; (3) not to begin hatching before March or April.....

So far as we can learn, the honor of producing the greatest amount of butter or milk in

proportion to live weight, lies between the Brittany cow and a goat. Most farmers would rather feed cows at a loss than to keep goats at a profit. In Scotland a goat show is one of the regular events of the year.....

"If you want the kettle to boil, don't add cold water." Remember this you gentlemen who feel disposed to laugh at the boy's plans just because you know more than he does.....

Farm & Home says that rancid butter may be restored by washing it first with good new milk, and next with spring water. The butyric acid is said to be freely soluble in fresh milk.....

Among new roses try Marshall P. Wilder, Her Majesty and W. F. Bennett.....

We would recommend a trial of the following new or comparatively rare shrubs: Rhodotypus Kerreoides, Viburnum plicatum, Sambucus aurea, Philadelphus aurea and Hydrangea quercifolia.....

To our newer readers, who are so situated that they desire to try new fruit, we would mention as worthy of trial the Poughkeepsie Red, Empire State, Ulster Prolific, Eaton, Roenbeck, Cayuga, F. B. Hayes, Eldorado, Cottage and Brighton Grapes; the Golden Queen, Marlboro, Earhart Everbearing Raspberries; the Industry Gooseberry; the Parry and Jewell Strawberries; the Frederick Clapp and Dr. Reeder Pears.....

The premium crop of turnips at the Gloucester Root Show, England, recently held, yielded 34 tons, 1,104 pounds, or 1,152 bushels per acre. The yields of the best acre of mangels winning the first prize at the same show was 46 tons, 1,172 pounds, or 1,553 bushels. These were very large crops for any country, and represent an enormous amount of stock food. It is a great pity American farmers do not pay more attention to root-crops.....

Everywhere.

RURAL SPECIAL REPORTS.

Alabama.

Huntsville, Madison Co., Jan. 24.—None of the Rural corn fully matured, neither did the beans. The tomatoes were fine and I think worth raising. I am much pleased with your Seed List for 1886, and shall test them thoroughly, as I have now an opportunity for such work. I am saving the Rural to make into yearly books. J. D. W.

Arkansas.

Poteau, Scott Co., Jan. 12.—The past Fall and Winter have been all that could be desired for fine weather. Very little rain yet, hardly enough to keep the ground in good plowing order. But now we are having the coldest weather ever experienced in this part of the country. The "blizzard" set in here on the evening of the 7th, and the mercury fell 42 degrees in 15 hours. The thermometer stood at 10 degrees below zero on the morning of the 8th, and stood at from six to eight below all day, and has ranged from zero to 18 above ever since, making this the coldest spell ever witnessed here by about five degrees. There has been but little snow yet, hardly enough to cover the ground. It is feared by some that the peach buds are killed; but this is such a dry freeze, I don't think they are injured to any great extent. Cattle are in fair condition for this time of year, and have needed but little attention yet; but now they are faring badly, however well they are fed, for most of them are without shelter, and have to take the storm as it comes. Hogs are doing well out yet, as there is plenty of swamp mast. Many hogs died from cholera, which makes pork a little scarce. It is selling at from five to six cents. Most of the pork hogs will have to be corn-fed, as the swamp mast will not fatten much till late. And it is an "up-hill" business here to make six-cent pork with 50-cent corn. One bushel of corn will only make about five pounds of pork on an average; so it will take two bushels of corn to make enough pork to pay for one bushel. H. C. B.

Arkadelphia.—The Rural seeds proved valuable. The corn matured early and was of good quality; some stalks had from two to four ears of good size. The beans and peas were fine; and as to the tomatoes, I raised some of the largest I ever saw; one of them tipped the scales at 1½ and another at 1¼ pound. The Garden Treasures did well and furnished many flowers to the delight of my little-four-year-old daughter. McG.

California.

Diamond Springs, Eldorado Co.—Some of the Rural corn was splendid—ears 14 inches long. The peas did not germinate. The beans did very well, and the melons and the beautiful flowers were grand affairs. Success to the Rural! W. A. S.

Canada.

Renton, Ont., Jan. 22.—We are well pleased with the Rural seeds. The peas were splendid. H. M. Garden of 1884 are the most productive. Part of the mixed corn was too late, the rest was nearly all destroyed. The Garden Treasures did not come up very well, owing to cold, wet weather. Crops are generally good, except potatoes—they were poor in quality and rotted badly. Prices are low. M. S.

Indiana.

Lawrence, Marion County.—Prices of farm produce are low, and farmers, especially renters, are not making much more than a living—some of them hardly that. Rents are high here, and most of the farmers have a lesson to learn in keeping their ground clovered and in good order. Continual cropping without rest or manure, is beginning to tell on the fertility of the soil. Stock are being wintered in fair order; but it takes an immense amount of feed, especially where the right kind of shelter is not provided. G. H. H.

Nebraska.

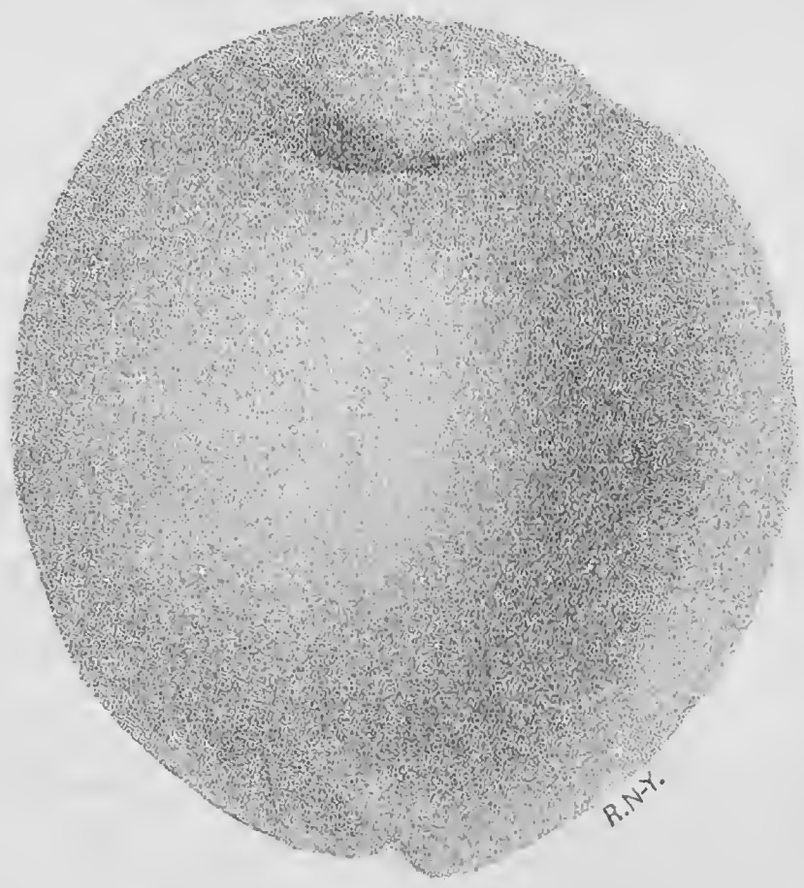
Medicine, Lincoln Co., Jan. 15.—All the Rural seeds germinated and grew very well. All proved to be good, and seemingly adapted to this part of Nebraska except the Rural Corn. It matured, but was mostly too small and flinty. Nebraska wants large, long and many-rowed corn, while the Rural's, as it grew with me, was mostly a white and yellow eight-rowed flint variety. There were a few ears of other kinds, but none to compare with our native corn. The Johnson Grass came up in about four weeks and grew about six feet high. I have about one-fourth of a bushel of the seed in the chaff. My Flageolet Beans attained a hight of only about one foot. The tomatoes, peas and beans were all very fine. The Garden Treasures contained some seed that produced some fine flowers. I wish the Rural the success it richly deserves. J. L. McA.

New York.

Ellenville, Ulster Co., Jan. 19.—The 50 different crosses of the best kinds of corn were planted about May 25. Most of it came up, but did not mature before frost caught it. Sorghum halapense, planted at the same time, did not come up at all. The Stratagem Pea grew finely: pods very fine, long and well filled; have saved them all for seed. The Prince of Wales Pea did not grow as well as the others, but I got a fine lot for seed to try another year. The Green Flageolet Beans all came up and grew finely. I am very much pleased with them. The King Humbert Tomato is too small—will not be profitable for market. R. T. C.

Oregon.

Toledo, Benton Co., Jan. 19.—The White Elephant Potato, though small, has paid us many times more than the Rural has cost us.



THE GLOBE PEACH. From Nature. Fig. 65. (See page 88.)

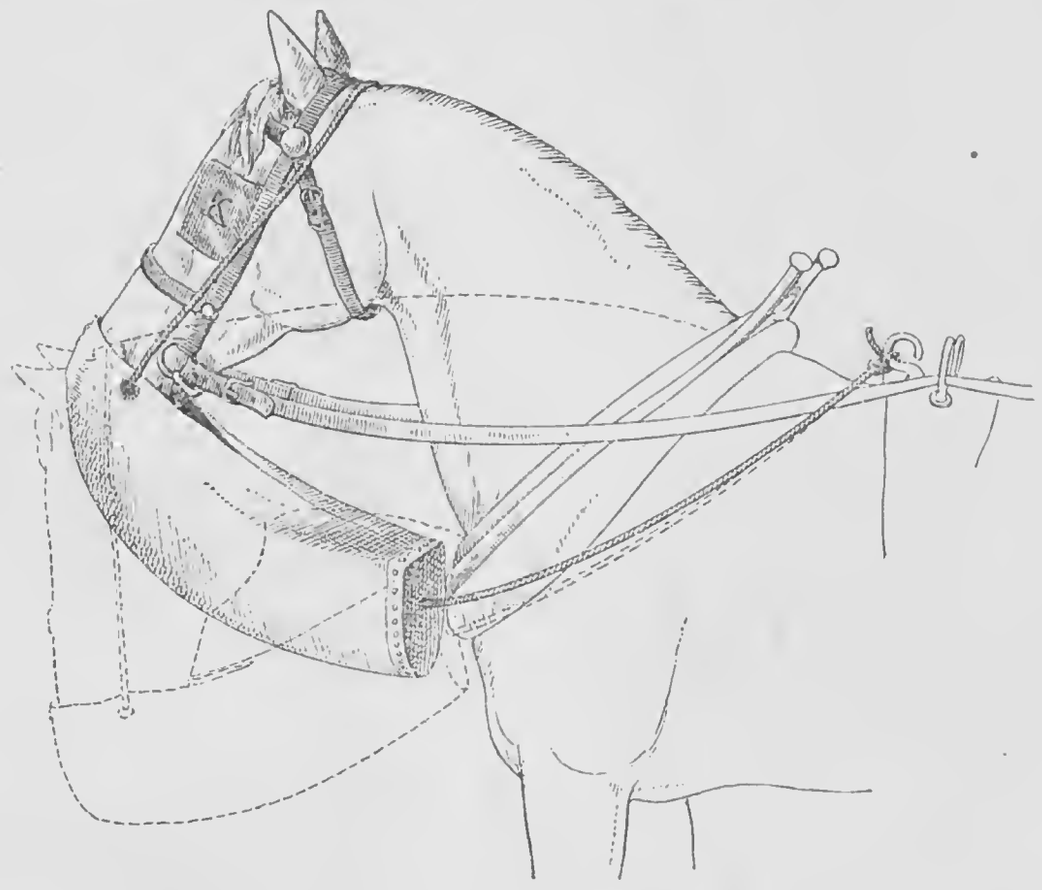
It is the best potato we raise. Of the other seeds, the tomatoes yielded finely—the best we ever raised in Oregon. The beans and peas gave good crops. I am waiting for the Johnson Grass to come up. We have had some beautiful flowers from the Garden Treasures. Potatoes, 40 cents per bushel; eggs, 25 cents a dozen; butter, 25 cents per pound. Wheat low, money scarce, tramps plenty. Don't let everybody rush to Oregon; those who have good homes in the East should stay where they are. L. N. B.

Pennsylvania.

New Paris, Bedford Co.—The Rural seeds all grew well, except the Johnson Grass: sown in May, did not come up till after the rains in July. The cross-bred corn did well, except that some was rather late. I raised nearly one bushel of ears from the seed I received; it was nearly all of the flint varieties. Price of wheat, $1; buckwheat, 40 cents; oats, 40 cents; corn, 50 cents; butter, 20 cents; eggs, 20 cents. N. B.

Washington Territory.

Puyallup, Jan. 18.—Snow is falling to-day, first of any account for the season. Of the Rural's seeds, the Stratagem was a wonder to look at—such pods! The Prince of Wales bore a fine crop—twice as much as the former. Saved all of both for seed. The beans also produced a fine crop—three quarts—which were also saved for seed. The flowers did equally well, and were a source of much pleasure to the little ones. The rest amounted to nothing with us. J. M. O.



FEED BAG FOR HORSES. Fig. 53. (See page 88.)

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time.]

MANURE AND FEED QUERIES.

H. W. K., Clayton, Penn.—1. What percent on its cost would be saved by erecting a shed, costing $100, for the manure from 15 cows? 2. Chemists say that nothing is lost in curing hay; if this be so, why do cows give more milk when grazing than when eating the hay from the same meadow? 3. How many dollars per head of stock will it pay to spend in bringing pure water into their troughs?

Ans.—1. This all depends upon how the manure is treated. If put into piles as fast as made and away from the water coming from the barn roofs, there is no loss from leaching under ordinary circumstances. The manure from the horse and cow stables should be mixed as piled, and unless plenty of bedding is used, should have the leaves, weeds, etc., about the premises, mixed in as piled, and the piles should be broad enough so that the rain and snow falling thereon should prevent their heating. If the $100 is put at interest instead of into a shed, and the $6 interest be used in purchasing gypsum to be scattered daily over the heap, it will pay much better than the shed. We much prefer hauling the manure to the field just as fast as made and spreading just where to be used in Spring, unless the ground is liable to be flooded or the snow is extremely deep. 2. The nutritive elements of the green grass are more soluble and much more easily assimilated by the digestive organs of the animals. If the dry food could be steamed to a point very like its summer condition, the hay would produce the same results. It is because of the mixing in of the succulent food that cattle do better when roots or silage are added to their dry forage. 3. It is useless to try to keep stock without plenty of good water; 75 per cent. of their entire bodies is made up of water, so that water must be had in plenty if we would feed stock successfully. Man will find much to answer for in not giving the animals what water they need. Whether it will pay to bring water in pipes depends upon how cheaply it can be had otherwise. If a man spends $500 in bringing water, and the work is well done, the annual interest is about $30, which would be cheap enough for 15 head of cattle.

CHRONIC GLANDERS IN A HORSE.

A. C. J., Columbus, Ky.—My three-year-old mare came out of the cane after last Winter in poor condition, though she should have been fat. She worked well; but her appetite was not good. She was put on a second crop clover, from which she came up one night with her throat and jaws very much swollen, so that we thought she had been "fooling" with some bumble-bee's nest. She was treated accordingly for a while; her throat would be quite swollen at night and better in the morning. The swelling is worse when she is feeding where the pasture is short. And she holds her head to the ground for a long time. She is now very thin and has a very poor appetite. This morning her throat and a narrow strip under the belly were swollen. All last Winter she would shiver as if cold, and at times she stamped a great deal as if through nervousness, and trembled. What is the matter?

Ans.—The symptoms given lead to a suspicion of chronic glanders. If the animal has been in contact with any glandered horses, the suspicion becomes almost a certainty, and the animal should be destroyed at once, as dangerous to man and other animals. If there has been no known glanders in the neighborhood, the animal may be isolated, the nostrils steamed daily by feeding hot bran mashes, poultices applied to the throat, and fed on a laxative, nutritious diet for two or three weeks. If there is no improvement, the case may be diagnosed as glanders and the animal shot. Care should be exercised by the attendant that any discharges from the animal are not allowed to come in contact with his person, especially if he has any sores on hands or face.

ACTINO-MYCOSIS.

C. B., Mansfield Valley., Pa.—For the last six months a lump has been growing on the angle of the jaw of one of my cows; it is about 2½ to 3 inches in diameter and apparently adheres to the bone, otherwise she is in good con-

dition and feels well; what can be done for her?

ANS.—The growth is probably due to a radiating or star-like vegetable parasite, the actinomyces or ray fungus, producing a malignant or parasitic tumor known as actino-mycosis. Any part of the body may be attacked by this parasite, but the jaw-bone and tongue are most commonly implicated. The fungus usually enters the system through some sore, as in case of the jaw bone, the disease can usually be traced to a diseased or decayed tooth. The only known successful treatment is anti-parasitic. In general, clear out all diseased masses and fungoid growths, and dress with iodized-phenol, a mixture of iodine and carbolic acid. The tumor should be cut down upon and entirely removed and the surface painted with the iodized-phenol, an operation requiring a knowledge of the anatomy of the part. Great care should be exercised in handling the disease since it is communicable to man. Diseased animals should be isolated, if treated, or destroyed to prevent contamination of healthy animals.

AN AILING PIG.

F. E. S., Hudson Center, N. H.—At the end of October I got from New York State a pair of Duroc-Jersey pigs about six weeks old. When taken out of the box they began to rub themselves against the sides of the pen, as though they itched badly all over. In two or three days the boar pig had scours. His skin looked very bad, and his head and neck became covered with a sort of black scab that looked like dried blood. His skin now looks somewhat better, but he scours all the time. His food does him little good, leaving him as it entered him; yet he is hungry in an hour after eating. He is in pretty good condition, but gains very slowly, being now only 33 pounds against the 70 pounds of his companion from the same litter; what can be done for him?

ANS.—This sick pig may have taken cold which developed into a chronic diarrhea, or its food may have been too hearty or strong for good digestion, and on this account an inflammation of the stomach may have followed. The pig may have been shut in the car too closely and got heated on this account. The itching and inflammatory condition of the skin would be a result of over-heating. The pigs may not have been fed on the way and gorged themselves when fed on arrival. All these things are likely to occur. Give the pig dry oats and charcoal with a quart of warm water for drink. Let it eat all of the oats and charcoal it will, and if it does not get better in a few days, give it two tablespoonfuls of castor oil, taking care not to strangle it. After this medicine has had time to cleanse the stomach, feed nothing but dry oats and charcoal and inject warm water and starch with a few drops of laudanum added to it. Do this twice a day.

SWELLING ON A MULE.

C. P. T., Eureka, S. C.—What is a sure cure for swelling on a mule?

ANSWERED BY F. L. KILBORNE, B. V. S.

If the injury is recent, with only heat and tenderness of the part, bind a wet blanket over the seat of tenderness as long as the heat and tenderness remain, and keep the animal quiet. For slight wasting of the muscle, active friction with a corn-cob, brick, or other hard substance, for 15 or 20 minutes once or twice daily, along with moderate daily exercise on level ground, may be all that is necessary. Failing in this or in cases of longer standing, the repeated application of a mild blister of ammonia and oil, and in obstinate cases, cantharides blisters may be demanded. The most rapid method, however, of replacing the wasted muscle where an electric battery can be had, is to send a current of electricity through the muscle 15 or 20 minutes daily. Apply one electrode at the upper and the other at the lower end of the muscle. The moderate daily exercise on level ground is very essential, except during the period of heat and tenderness, when rest is desirable.

CONJUNCTIVITIS IN A HORSE.

Constant Reader, Waverly, Tenn.—My mare's eyes have been running matter and water for several weeks; what is a remedy? Her eyes are otherwise good and there are no symptoms of blindness.

ANS.—The watering of the eyes is due to some external irritation producing slight inflammation or conjunctivitis. First examine the eyes carefully for foreign bodies, which if present must be removed. In their absence the difficulty may be due to a common cold, standing in a current of air, or to irritating gases, as from accumulating dung and urine. For treatment, keep in a clean, dry, airy, darkened stable. Give a laxative—four or five drams of Barbadoes aloes. Apply tepid fomentations to the eyes and protect them from the light. Give special attention to the general comfort of the animal. It will also be desirable to apply a little soft extract of belladonn around the eyes to prevent adhesion of iris and lens. If the case does not yield to the above simple treatment, cover the eyes with a cloth kept constantly wet with the following solution: Water one quart, lead acetate one dram, and morphia 20 grains.

SORE FOOT IN A COLT.

Subscriber, (address mislaid).—My nine-months-old colt stands too much on the toe of its right fore-foot. Examination shows the frog to be small and the hoof a little long at the heel at each side of the frog. The frog is filled out and grown down at the heel, with one or more cracks in it at the heel, which spring open when the heel is pressed; but the colt shows no sign of weakness. What should be done?

ANS.—Examine the frog carefully for any foreign body. Pare away the dry hard edges of the cracks, clean the whole with soap and water, and apply a tar bandage until the cracks are healed. The heels must be gradually pared down to bring the foot to the ground in its proper position. If possible it would be well to place the case in the hands of a competent veterinary surgeon.

Miscellaneous.

W. A. C., Almont, Mich.—Where and how can I get the last U. S. Census Reports?

ANS.—Like all other works printed for free distribution, the Census Reports can be secured only through the Representative for the applicant's district, or one of the Senators for his State. It is a trifle doubtful whether the reports can be obtained at such a late date, as so many applications have already been made for them. The Compendium of the Census, in two volumes, may still be obtained, however. All the full Census reports have not been published yet.

E. D. B., Seneca Falls, N. Y.—1. Bones can be ground more easily when baked brown; would doing this hurt them for fertilizer purposes? 2. What is a good plan for a home-made horse or any other power?

ANS.—1. Yes, the bones would be thus deprived of their nitrogen. That is all. 2. We have given many plans in previous numbers. We may present others ere long.

C. E. R., H St., Sacramento, Cal.—Are any of the white strawberries worthy of cultivation? If so, which one?

ANS.—Only as a curiosity and perhaps for amateur use. Lennig's White we think the best. It is very good-flavored.

J. E. C., Middle Grove, N. Y.—Yes, Mapes' Potato Manure is as good as any; but several other brands have given equally satisfactory results.

DISCUSSION.

W. H. H. J., HOHOKUS, N. J.—Referring to remarks of J. J. H. Gregory, on overvaluation of hen manure, as published in a late RURAL, has not Mr. Gregory got slightly out of his latitude in thus underrating the efforts of the hen to produce large crops of corn? An experience of many years with poultry, during which I have made careful experiments with a desire to do justice to both the debit and credit sides of the ledger, has satisfied me that the following figures are approximately correct:—The average full-grown fowl consumes in a year the following quantity of food or its equivalent: 56 pounds of corn, 30 pounds of wheat, 25 pounds of bran and an unknown quantity of hay in Winter, grass in Summer, bugs, worms, ground shells, bone, lime, broken crockery, gravel stones, etc., etc. The following table gives the value of manure from 100 pounds of each of the above named grain foods: Corn, 33 cents; wheat, 35 cents; bran, 73 cents. Thus we have, leaving out fractions, from 56 pounds of corn manure valued at 18 cents; from 30 pounds of wheat, 10 cents, and from 25 pounds of bran, 18 cents—total 46 cents, to say nothing of all the other articles consumed. The waste need not be more than with any other stock. With me it is less, for I have learned the value of the manure, and am careful to save and properly store it. For corn and many other crops, it has equaled Peruvian guano, pound for pound, on my farm.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, January 30, 1886.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, FEBRUARY 6, 1886.

If the number on your address label is 1880, your subscription expires with this number; if 1881, next week; 1882, in two weeks, etc.

How far north is the Japan Chestnut hardy? We would feel obliged if nurserymen or any of our readers who are growing this tree would answer. How much hardier is it than the Spanish Chestnut?

Subscribers of the Rural *need never take the trouble to write us to "stop" the paper. It is invariably discontinued at the expiration of the subscription term, except by oversight, in which case it is our loss.*

A neighboring farmer has had an Evergreen Blackberry growing beside his kitchen (looking east) for six years. The canes make a strong growth from the root every season, but are always killed back during the Winter. The leaves are still (Jan. 28) green. It has never borne fruit.

We have received very many letters regarding what is known as the Evergreen Blackberry since our statements, made from time to time, that it is simply a variety of the European species Rubus fruticosus, and valuable chiefly as an ornamental vine or curiosity. But it seems there are varieties and varieties. During the past season, we have received fruit from the Far West, that was of very good quality, while the vines were absolutely loaded. Our illustrations, which have been prepared with great care, and the articles accompanying them should therefore excite some interest.

FORFEITURE OF UNEARNED RAILROAD GRANTS.

As long ago as August, 1856 and March, 1857, large land grants were made to Alabama, Louisiana and Mississippi, for the construction of various railroads, none of which have been built; yet, during all these long years, the land has been withheld from settlement. A bill is now before the Lower House of Congress for the forfeiture of all unearned land grants in those States, and from the tone of the discussion, it is evident that a large majority of both parties are determined to vote for all bills forfeiting these and similar grants. The grants to the Southern Pacific Railroad and all the unearned parts of the extravagant grants to other roads, are also likely to be declared forfeited. All these lands, amounting in the aggregate to over 100,000,000 acres, should be at once restored to the public domain for entry under the Homestead Laws. It is a burning shame that, while multitudes of poor settlers have for years been hunting for favorable locations for homesteads, these lands—some of them excellent for agricultural purposes—should have been held so long at the disposal of a handful of wealthy speculators. Instead of being the happy homes of numerous families, and contributing to the wealth of the nation and the income of the Government, they have lain waste, or been a stimulus to the idleness and thriftlessness of the squatter and the vagabond.

SQUABBLES OF STOCKMEN.

In spite of the late amalgamation of the two great live-stock associations—those of Chicago and St. Louis—the cattle baron, king, syndicate and corporation family doesn't appear altogether happy. The members own millions upon millions of beef-covered beasts in Summer, and of hide-clad skeletons in Winter, but there's a world of bickering and contention in the family circle. Those of Wyoming and Montana are tolerant of cheap Texan stockers and feeders, because by filling out the gaunt creatures on their ample ranges, they can make an excellent profit, while the danger from Texas fever is trifling when the beasts have reached those northern latitudes. The stockmen of Nebraska, Kansas, Arkansas and Colorado, on the other hand, bitterly oppose the admission of the Texans as destructive to the other herds along their route. The land-grabbers of New Mexico strenuously resent any outside encroachment on their stolen domain. There is also a multitude of other grounds of contention between the lords of the various State ranges. Even within the several States and Territories there is a great deal of squabbling between different interests. In Texas, for instance, the stockmen from the south are a unit against "free grass," and generally are squarely opposed to their brethren of the Pan-handle on the question of Spanish or Texan fever. They also insist that grazing lands are worth from 16c. to 20c. an acre annually, whereas the Pan-handle men contend that half that amount is an exorbitant rental. There are also rancorous differences on the quarantine and several other local questions; besides the never-ending war with the sheep men, etc. Truly, the possessor of cattle on a "thousand hills" is not always happy, unless, perchance, he finds happiness in constant contention.

PRIZES.

TEN DOLLARS

for the largest Bird Cantaloupe from the Seed of the Rural's present Free Seed Distribution.

TEN DOLLARS

for the largest Watermelon.

TEN DOLLARS

for the longest ear of the Angel of Midnight Corn containing the greatest number of kernels.

TEN DOLLARS

for 10 of the heaviest pods from the Alaska Pea.

The Prizes will be awarded October 1st, 1886. All competitors will be required to advise us as to the weight or size of their peas, melon, or corn by postal card. Those who take the prizes will then be required to send the peas, corn, or melons by express at the Rural's expense.

AWAY WITH ALIEN LANDLORDISM!

In what other nation in the entire civilized world are aliens, who have no intention of settling in the country, permitted to become the possessors of large tracts of real estate? Here this evil has become so flagrant and its results so intolerable that prompt Congressional legislation, putting an end to the practice, is urgently demanded. Not only have foreigners bought vast areas of the public domain at merely nominal figures, and either leased or used them as cattle ranges, or held them until, owing to the rapid rise in the price of land, they could sell them at an enormous profit; but they have also illegally seized large tracts of the public land, fenced them in, and in the grossest way oppressed and abused our own native and naturalized citizens who sought homes there in accordance with the law of the land.

There is another class of alien land owners about whom the public knows little or nothing, but who cause a world of misery and degradation. These are the alien absentee landlords who own large estates in this country, and, in order to get money to hoard or squander abroad, grind the faces or their American tenants, and introduce into this free country the worst features of the cruel landlordism that has for centuries cursed shackled Ireland. William Scully, of Celtic birth but now a resident of London, is an instance of this abhorrent species. As an Irish landlord, his career was so disgraced by oppression and extortion, that it was appropriately finished by an encounter with his tenants. He was tried but acquitted of double murder, but was so execrated that he sold his Irish property in 1865, and since then has been building up in Illinois, Kansas and Nebraska the system of landlordism, which even Irish peasants, accustomed for centuries to oppression, could not endure. For 50 cents an acre, he bought land warrants issued to the soldiers of the Mexican war, and in this and like ways, acquired large tracts of land in the above and other States. In Logan County, Illinois, alone, he has 40,000 to 45,000 acres, and his rule over his 250 tenants there has, we are assured by the Chicago Tribune, "reduced their families to a condition approaching serfdom." The long account given by that paper of Scully's system of landlordism in Illinois shows a heartless cruelty, a pitiless oppression equal to anything we have ever heard of or seen in Ireland.

Congress, before the close of the present session, should pass laws providing not only against the prevalence, but even against the possibility of such abuses. We want neither alien land-grabbers, alien landlords, nor, above all, Irish landlordism in this country. Away with every vestige of them!

SLUG-SHOT.

Mr. Bemjamin Hammond, the proprietor of Slug-Shot, writes us as follows:

"A copy of your paper, dated January 23, 1886, is received, and comments on 'Hammond's Slug-Shot' noted. As the substantial formula of 'Slug-Shot' has not been kept a secret, and the statement made by me is correct, I extend you and all persons interested, an invitation to visit my factory, and go through my works, from cellar to garret, and investigate and publish the report as fully as you choose."

On page 322 of the 1884 report of the N. . Experiment Station, is the following statement:

"The indications are that Hammond's Slug-Shot is neither more nor less than London-purple mixed with a very large proportion of gas or slaked lime."

The qualitative tests of lime and arsenic are very simple, and it seems reasonable to suppose that the Chemist of the Station would not have made the above statement without having made these tests.

If, however, the Chemist is wrong, it will be a very easy matter for Mr. Hammond to *prove* it—and that is what he should do. Our interest in the matter does not go beyond desiring to inform the public whether it is or is not an economical and safe insecticide. Its efficiency is not questioned. A thorough chemical analysis of samples procured of retail dealers would settle the question at once.

If, as the Chemist of the N. Y. Station intimates, Slug-Shot is composed of London-purple and lime, it certainly is not an economical insecticide at the prices charged for it.

Since writing the above, we have received a letter from Director Sturtevant, who says that the Chemist of the Station "did not make the statement" with which we credit him, thus removing the responsibility to some other officer of the Station. He further refers to a letter sent to us, Jan. 8th, in which the following passage occurred:

"There is no doubt but what Hammond's Slug-Shot contains arsenic. The test for arsenic cannot be mistaken. Whether this arsenic is in the form of white arsenic, Paris-green or London-purple, I do not know. . . . The mere fact that it contains arsenic is sufficient. If Mr. Hammond makes an affidavit that there is no arsenic in his preparation, it will then be time enough to present evidence."

This note from Dr. Sturtevant was in reply to a printed card from Mr. Hammond, sent to us, which we forwarded to the Station. The card was, as we remember, an affidavit that the Slug-Shot contained neither London-purple nor lime.

Dr. Sturtevant's letter reproaches us with injustice both to the Station and the Station's Chemist. No injustice was intended, and we shall gladly present the case fairly as soon as we are shown wherein the injustice lies.

WINTER LOSSES OF STOCK ON THE RANGES.

As usual, there is a great difference of opinion with regard to the extent of the losses of live stock, and especially of neat cattle, on the great Western ranges thus far during the Winter. As yet all reports must be based on mere estimates founded on the deaths observed within circumscribed areas under special conditions. Dead cattle have been seen by hundreds along the lines of railroads, where they sought shelter; by thousands along river banks, where their ceaseless drifting before the blizzards was checked; by tens of thousands beside wire fences, where, huddled together, they starved and froze to a miserable death. No calculation, even approximately trustworthy, can be made before the Spring "round-ups." Then, too, nearly all the business of stock raising on the plains and prairies has been concentrated in the hands of a comparatively small number of cattle kings, foreign syndicates and domestic joint-stock companies. The days of the small stockmen are over. The owners of "bunches" of 100 to 500 head of cattle have been either ruined or forced to sell, at any figure, by the rapacity, arroganee and tyranny of their wealthier, more powerful and wholly unscrupulous neighbors. Many of these corporations have been formed for the express purpose of securing investments from people at a distance, either in this country or in Europe, and there has often been as much misrepresentation, exaggeration and fraud in their circulars and prospectuses as in those of the most disreputable "wild-cat" mines further West. Most of them are only too willing to dispose of some of their stock at extravagant figures, by selling shares at prices based on grossly exaggerated accounts of profits. It is to the interest of all these to minimize the winter losses of stock, so as to prevent any serious depreciation of their property in the eyes of prospective investors. Accordingly, every year, through the press and in other venal ways, they are accustomed to belittle the losses due to their shiftless and cruel mode of stock raising and the severity of a semi-arctic Winter on the elevated and exposed ranges.

Probably the most disastrous cause of loss, however, arises from the introduction of wire fences on the ranges. In most cases, the use of these was prompted by an unscrupulous rapacity which defied law and all considerations of fair play. Corporations inclosed millions of acres to which they had not a shadow of title. They drove out hundreds of poor men, struggling for a living by a little farming and raising a few head of cattle. Often they deliberately fenced in wells and water-courses to force their weaker neighbors either to sell their stock for a song or leave the country. They tore down the fences and turned in their herds upon the crops of the weaklings. When all other means failed, their hirelings' rifle, pistol or bowie got rid of an obnoxious settler, in a purposely provoked quarrel, and his starving family soon scrimped or begged their way to a less brutal region. So long as they made large profits, these spoliators cared not a whit for the laws of God or man. While the wire fences, however, kept intruders out of the stolen ranges, they have also prevented the stock from seeking food and shelter in stormy weather. On the shelterless plains and prairies, cattle never cease drifting before a beating storm unless they find the shelter of a timber belt, a bluff or a depression. On encountering a wire fence, they crowd along the line in dense masses, the weak and ailing are trampled to death, and their stronger comrades soon perish from hunger, thirst and exposure. So great have been the losses from this cause, that in some sections there has been serious discussion among stock owners as to an advisibility of removing the fences. "A just retribution!" one is tempted to exclaim. But just think of the horrible agony of the perishing cattle! The stock owners, too, if their losses are great and widespread, can generally recoup most of them by throwing them on the consumers, by raising the price of cattle on the hoof.

BREVITIES.

Music in the farm home! Let us have more of it!

Parsley-leaved is one name for the Ever-Green Blackberry.

Yes, "let us be cheerful in our homes." Read Rural "Life Notes."

Money sent in letters for subscriptions to the Rural New-Yorker is at the sender's risk. Our terms are invariably $2.00 a year in advance.

We have received a number of communications regarding Meech's Prolific Quince, which we cannot publish. Our space is too valuable to be given to a matter which really needs no further discussion.

W. L. Ward, of Marshall, Dane Co., Wis., writes: "The Enterprise Meat Chopper has just come to hand. It is the best machine I ever saw for cutting meat, for it truly *cuts* it. The machine is surely a prize."

Notices of catalogues are continued this week on the following page. Refer to the advertising columns for particulars, and mention the R. N.-Y. in any correspondence. Such mention is advantageous to all parties—the correspondent, the advertiser and the Rural.

Referring to Notes from the Rural Grounds of this week, and to the effectiveness of Pyrethrum powder as an insecticide, it may be well to say that we have tried it as a remedy for gapes in chickens. The chicken inhaling it died, though possibly too sick to recover in any case.

We are now mailing the Rural's Free Seed Distribution. Plant the seeds carefully in well-prepared, mellow soil. Give them all a good chance and let us see who will raise the largest water-melons and musk-melons; the best plot of corn (the name oppresses us); the earliest peas, the best assortment of flowers. Try and interest the children in this good work.

Mr. Thomas describes the Hericart Pear, illustrated on page 88, as of medium size, fine-grained flesh, buttery, often gritty and slightly astringent. He says it is not rich, but possesses a peculiar aromatic flavor. It ripens the last of September. With regard to the Omer Pacha, he rates the quality as juicy, buttery and vinous, and says it ripens Sept. 1st. The size is also medium.

In our premium list we were in error in stating that the sets of Pilling's milking tubes contained different sizes. The truth is the four tubes are all of the same size. The price we gave correctly—50 cents each, or $2 for a set of four. They are just what is needed by every man keeping cows, and we shall take great pleasure in sending them as mentioned in the premium list.

Indust'l Societies.

WESTERN NEW YORK HORTICULTURAL SOCIETY MEETING.

THIS old and influential society held its annual meeting at the Common Council Room, City Hall, Rochester, New York, commencing Wednesday, at 11 o'clock, A.M. President Barry, on taking the chair, congratulated the society on having the largest attendance he had ever seen at the opening of the session. As was very proper, Mr. P. Barry was unanimously re-elected President; Messrs. S. D. Willard, of Geneva; W. Brown Smith, of Syracuse; J. S. Woodward, of Lockport; and W. C. Barry, of Rochester, were elected Vice-Presidents, and Mr. P. C. Reynolds, of Rochester, was re-elected Secretary and Treasurer.

The President, in his annual address, said the signs of a general revival of business were plenty, and nothing would be more profited by such a revival than horticulture, fruit growing and kindred pursuits. He was glad to see so much attention being given to the improvement of the methods of agriculture, and commended the experiment stations and agricultural colleges. He also had a good word to say for forestry, and thought our State would be the gainer were thousands of acres of its rough land planted with forest trees. He said that the Sequoias on their grounds had been slightly injured by the last Winter, but had nearly recovered during the Summer. He thinks the fruit crop is of so much importance to New York that our orchards should receive more care and better culture. In a report of the markets in the large cities he had noticed ordinary apples quoted at $1.50, while extra nice, selected barrels had brought from $2.50 to even $4. While pears, as ordinarily sorted, packed and sent to market, had sold for from $1.50 to $5 per barrel, he had known fine pears, nicely sorted, each pear wrapped in tissue paper, and packed in bushel kegs and boxes, to sell readily at $5 per bushel. More care in sorting and packing fruit will certainly pay.

Mr. George Ellwanger, in an essay on ornamental trees and plants, said people soon tire of the finest pictures ever painted; but a beautiful landscape or a fine tree, only interests and charms us the more the longer we study it.

Mr. Chas. A. Green, in a report on ornithology, said a single swallow in a Summer's afternoon will destroy more insects than a man with a bucket of Paris-green and water. The birds destroyed that their stuffed skins might disgrace the hats of the city belles, would, if allowed to live, have been of more real use to mankind than will all the city belles in a century of their aimless lives. It had been charged that some birds were destructive to fruit, and it might be necessary sometimes to kill them; but we should do so only with the same feeling with which we would take the life of a human being—only as a painful necessity.

Mr. Harrison charged that the English sparrow was not only destructive to grain and fruit, but that it did much to drive away ornamental and useful birds.

Mr. Woodward said he was no friend of the sparrow; but that the insane fashion of wearing stuffed birds as ornaments had done more to exterminate beautiful and beneficial birds than all other causes combined. It seemed to him anamolous that woman, the personification of gentleness, mercy and love, should be so cruel and so far forget her nature as to ornament her hat with the corpse of man's best friend. He wished that he could make every woman realize that to wear one of these ornaments costs a little life, as much in God's keeping as her own.

Dr. Sturtevant said that at the Experiment Station English sparrows have injured the wheat plots as much as five bushels per acre. In a report on botany he suggested a modification of the definition of fruits and vegetables to correspond with the popular idea. He would have classed as fruits such plants as are raised from off-shoots, runners, cuttings or grafts; as vegetables such as are usually raised from seeds.

Mr. J. J. Thomas, in an essay on "Increasing the Attractiveness of Country Homes," said that too many farmers' houses were mere boarding-houses, in which the farmers' wives and daughters work like slaves. It would be much better and give a far better class of help on the farm, if married men were employed, houses furnished, and each boarded at home. A few inexpensive plants and flowers would make the surroundings pleasant and the home happy, even though the house be cheap and rude. Better spend money in making the home pleasant and enticing with flowers and books and pleasant faces, and thus keep the children at home, than by stinginess to drive them away to the corner grocery or the gambling saloon.

Dr. G. C. Caldwell, in considering salt as it affects plants, said it could in no sense be considered as a manure. It is found in most plants, but it exists in all soils in abundance, and in most waters, and the plants are obliged to receive it, yet it may sometimes be useful to the soil and to the crops growing thereon. It aids in rendering some compounds more soluble. It carries other elements with it down deep in the soil. In enabling the plant to better withstand drought, it does it, not by attracting moisture and making the soil more humid, but by forcing the plant to use water more economically, or in other words, by evaporating less from its surface. It is what may be termed an amendment instead of a manure; it adds nothing to the soil which the plants need, but it causes the soil to more readily yield the food it already contains. He said the salt employed in agriculture is impure, and as a rule, the greater the degree of impurity, the more valuable they are as an application.

(To be Continued).

SPECIAL PREMIUM—THE AQUAPULT.

A CONVENIENT, handy force pump, fire engine, sprinkler, window and wagon-washer, bug-destroyer, etc., etc. The illustration fully explains its construction and the manner in which it is used. It is a very convenient tool

for use in the green-house or on the lawn, and throws water with considerable force. It is made by W. & B. Douglass, Middletown, Conn. We have nine of them complete. Price $9. We will send one of these to each of the nine subscribers wishing it who shall first send us clubs of five new subscribers. Remember we have but nine, and the offer will not be extended beyond that number.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

FRANCIS BRILL, Riverhead, Long Island, N. Y.—A treatise (16 pages) on cauliflowers and how to grow them. Mr. Brill is an experienced grower, and he tells the whole story in a plain, thorough manner.

WALDO F. BROWN, Oxford, O.—Twentieth annual catalogue of vegetable and flower seeds. Mr. Brown also offers eggs of pure Plymouth Rock hens for the low price of one dollar for 13 eggs.

A. W. LIVINGSTON'S SONS, Columbus, Ohio.—An illustrated catalogue (70 pages) of seeds. The new tomato, Livingston's Beauty, is honored with a colored illustration, and other novelties are announced. Free.

WM. E. LINCOLN & CO., Warren, Mass., and London, Ontario.—Illustrated circulars of the Lincoln Patent Channel Can Creamery; also circulars of churns and butter-workers made by the same firm. This contains a full setting out of the claims made for this style of can. Send for it and read what they say.

JOEL HORNER & SON, Merchantville, N. J.—A descriptive catalogue of grape-vines and small fruits. An excellent chapter is given on planting, pruning, and the culture of the grape. All the new kinds are offered, such as Empire State, Niagara, Cayuga, Ulster Prolific, Poughkeepsie Red, F. B. Hayes, etc. The Jewell Strawberry is spoken of in the highest terms. Free to RURAL readers.

W. MITCHELL MCALLISTER, 720 Chestnut Street, Philadelphia, Pa.—Illustrated catalogues of optical instruments, spectacles, eye-glasses, opera, field and spy-glasses. It also contains a very clear description of the eye, explaining the various troubles with this delicate but very important organ; also a catalogue of all sorts of meteorological instruments. All persons interested in such things should not fail to send for one of these catalogues.

ORVILLE H. SHORT, SUCCESSOR TO SHORT & SMITH, Syracuse, N. Y.—An illustrated circular of the Patented Run-about Wagon. This circular gives a cut and description of the various styles in which the Run-about Wagon is made. These wagons are light, handy, strong, easy-riding and light-running. They weigh from 300 to 500 pounds, and are capable of carrying from 600 to 900 pounds. A good wagon cheap. Send for circular, and see how it is.

H. D. THATCHER & Co., Potsdam, N. Y.—The Dairy Stockman's Guide Book, or how to produce the best results with the dairy. This is a pamphlet of some 30 odd pages and gives much useful information to every one keeping cattle. Of course, it is issued to tell you about Thatcher's Orange butter-color, but the information in regard to the dairy and care of cattle, is worth its cost. Send for it, mentioning the RURAL, and you will be well pleased with it.

AMERICAN SMALL-YORKSHIRE CLUB. Geo. W. Harris, Sec'y, Box 3432 N. Y. City.—Volume No. 1 of the Small-Yorkshire Swine Registry is just issued. It is a nice little volume, containing the record of 350 males and 700 females, together with the names of the breeders and present owners. It also contains a history of the breed, of its introduction into the United States, the organization of the club, and the constitution and by-laws of the same. It also gives a scale of points for the use of judges and breeders.

CORNELL UNIVERSITY EXPERIMENT STATION.—The report of this station covering the work done in 1883-4 and 1884-5. Among other things it contains tables showing the cost and value of stable manure; the quantity and value of the manure from milch cows; changes in milk with changes of rations; gain of steer on a fattening ration, and also on a maintenance ration; experiments with various crops; cost of plant food in commercial fertilizers etc., etc. A good report worth careful study.

JONES OF BINGHAMTON, Binghamton, N. Y.—Price list of Jones's scales illustrating all the styles made, from the little Stop-Thief, weighing from one ounce to ten pounds and selling for $1.50 (which we give for three subscribers) up through the various styles and sizes, including the five-ton farm scale at $60, to the monster canal boat scale weighing 500 tons. The scales are all well made of good material and fine finish. It will pay you to send for and examine this catalogue, and remember always that "Jones, He pays the Freight!"

SYRACUSE CHILLED PLOW CO, Syracuse, N. Y.—An illustrated almanac and circular issued by this substantial house, giving every size, style and a description of the plows made by them; also cultivators, road scrapers, etc., etc. It is sufficient evidence of our estimation of this sulky plow to say that we have placed it on our Premium List and offer it, full-rigged, complete, and we pay freight to destination, for only 50 subscribers. Send for this circular, see what they say about this plow and then go to work and secure one. We ought to give away 100 of them.

NASH BROTHERS, Millington, N. J.—"Tillage is Manure," "How to Avoid Difficulties of Climate," "The Acme Pulverizing Harrow on New Breaking." Also a collection of over 2,300 testimonials from persons who have used the "Acme" in 48 States and Territories, embracing nearly every agricultural county of the Union. We have so often spoken favorably of this tool on the Rural Farms, and how well we like it, that we need to say nothing more here than to advise all to send for these books, which will be gladly sent if you mention the R. N.-Y. Each can then learn of this tool for himself.

GALBRAITH BROS., Janesville, Wisconsin.—A nicely illustrated catalogue of Clydesdale and English Shire horses owned and for sale by these extensive importers and breeders. This catalogue gives the pedigrees of over 50 of these fine horses, and is illustrated by numerous cuts of the most valuable animals. It also contains the names of 175 animals imported and owned by this firm since 1881, and by the stars we are reminded that more than two-thirds of them are noted prize-winners. Galbraith Brothers have also included in this a notice of some of the fine little Shetlands which they have imported direct within the past year. They range in hight from 36 to 42 inches, and one of them would make glad the heart of any boy.

BOWKER FERTILIZER CO., No. 43 Chatham Street, Boston.—A catalogue setting forth the value of the Stockbridge Manures and the Bowker's Hill and Drill Phosphate, Bone, Chemicals, etc., together with prices of the various fertilizers per bag and per ton. This firm also offers, as will be seen by the pamphlet, the various chemicals for home mixing, all of which are delivered free on board the cars either in Boston or New York. These so-called "chemicals" for home mixing, or for separate use, as desired, are muriate and sulphate of potash and German potash salts for potash; sulphate of ammonia, nitrate of soda and dried blood for nitrogen; ground bone, dissolved bone, dissolved bone-black and bone black for phosphoric acid. Thus the farmer may apply any one or any combination of these essential plant foods to his land, as from experiment he has ascertained what his land needs, or for the *purpose of ascertaining* what it needs. The pamphlet presents the results, of the use of the Stockbridge & Bowker fertilizers, as furnished by the farmers of many States. Our readers should examine the catalogue, which will be sent free to all of them who apply to the above firm.

SUMMARY

OF THE RURAL'S SEED DISTRIBUTION FOR 1886.

A full description, with illustrations, w given in the R. N.-Y. of Nov. 14, and this number will be mailed (free) to all who apply.

The Nov. 14th Number also presents a full count of the

$3,300

worth of presents which are offered to subscribers (not to regular agents) for clubs.

N. B.—One package (six in all), will be sent to all REGULAR SUBSCRIBERS who apply, and to them only. A two-cent stamp should be inclosed in the application, except by those who subscribe for the R. N.-Y. in connection with some other journal which offers the seeds in connection with the combination. In that case, an application is unnecessary. The seeds will be sent without application.

FIRST.

The Alaska Pea.

It is claimed that this is the earliest blue pea; that it is the best of its class; that it has superior shipping qualities, the pods remaining green longer than those of any other variety. It has never been offered for sale.

SECOND.

The Best of the New Watermelons.

Comprising a few seeds each of Kolb's Gem, Mammoth Ironclad, Scaly Bark, Cuban Queen, and Pride of Georgia.

THIRD.

Angel of Midnight Field Corn

This proved last season the earliest field corn ever tested at the Rural Grounds, though it may not so prove again. The longest ears measured 14 inches. The ears were borne low, with often three to a plant. Plants short.

FOURTH.

Garden Treasures,

for our lady friends, being a packet of not less than 100 different kinds of flower seeds mixed together.

FIFTH.

THE BIRD CANTALOUPE

(From Colorado.)

Introduced by the R. N.-Y. Oblong in shape, thickly netted, deeply ribbed; flesh thick and light green, sweet and delicious. Very early. The largest specimens weigh 20 pounds, as grown in Colorado.

SIXTH.

Hackensack Valley Muskmelons.

Gathered by the R. N.-Y. from the best growers of the Hackensack Valley of New Jersey.

IMPORTANT.

1st.—The RURAL NEW-YORKER never SELLS seeds or any plants grown upon its Experiment Grounds.

2d.—ONLY Regular Subscribers need apply.

3d.—IN MAKING application, it is only necessary to write "SEND SEEDS."

4th.---Strangers should send for the Nov. 14th issue of the R. N.-Y., which fully describes the Free Seed Distribution. Mailed without charge.

Address
THE RURAL NEW-YORKER,
34 Park Row, N. Y.

For Women.

CONDUCTED BY MISS RAY CLARK.

HOW WE INTERESTED OUR YOUNG PEOPLE.

Our Ladies' Sewing Circle belongs to a struggling church on the Western frontier. We have no church edifice yet, but use a hall instead. The society has furnished the hall with chairs, stoves, lamps and a good organ. We also have the foundation of a Sunday school library. A small room adjoining serves for a kitchen. We also have tables, and crockery enough to serve 50 people or more.

Our circle consists of active, intelligent women, who meet for social intercourse, and generally employ themselves with some light work.

The sewing circle meets once in two weeks in this hall instead of at the houses of different members, gentlemen being invited to tea at six. I cannot refrain from telling you how it has become so dear and homelike. The hall is lighted by three windows at one end and a sky light at the other, the platform and minister's desk being placed at the end with windows. This arrangement made it very trying to the eyes of the audience. One of the ladies conceived a plan to remedy this. She made a long curtain, reaching to the floor, of dark maroon cantou flannel with a lambrequin edged with heavy fringe, for the middle window, directly behind the speaker.

This curtain extended to the edge of the other windows, being 10 or 12 feet wide, completely excluding the light from one. The light from the other two windows was softened by movable screens. The upper part of these screens were composed of light blue paper-cambric with a dado below of dark maroon, and when these screens and curtains were decorated at the harvest festival, with bright leaves and trailing vines and ferns, the effect was delightfully artistic and restful.

Another lady, skilled in drawing and cutting out letters, prepared mottoes for the walls from dark brown plush paper. In a semi-circle above the middle window was pasted this motto in capital letters directly upon the white wall: "The Kingdom of Heaven is within you."

Near the entrance and over the cabinet of Sunday-school books was placed this motto: "This commandment I give unto you that ye love one another as I have loved you."

The ladies made it a study to furnish amusements and recreation of an unexceptionable character for the young people of the society in the way of games, entertainments of a social and literary nature. We have persistently kept out petty gambling institutions known as grab bags and ring cakes.

Soon after the summer vacation when everybody was fresh and in good trim for work, the members of the Society were invited to the home of Mr. and Mrs. J. S., "for the pleasure of the society and the profit of the minister," as the good man put it.

A day or two before the time appointed a note was sent to a score or more of the people asking them each to write an answer in rhyme to the question enclosed, the rhyme to contain a certain word which was also sent in the note. These productions were to be read for the entertainment of the people, the game being called "Crambo." The evening came and the house was filled with a glad company. There were humorous readings and quiet games. One of these games engaged both old and young, and we call it, "What is it like and why?" One person is sent out of the room and the others agree upon a subject to talk about. This time the word "Moon" was chosen. When the person was called in, she asked a little boy, "What is it like?" He replied, "It is like the sun." "Why?" "Because it is bright." Another said, "It is like a cow because it had horns and a face." She asked the third and received the answer, "It is like bread because it rises." The one giving the most information by his answer, had to go out the next time. George Washington and other characters of history were talked about; and such things as the human hair, artesian wells, etc.

"Crambo" was then announced, and the crowd gathered about the reader, who stood by the center table and was to read one by one the articles which had been prepared, the author's names not being known generally, thus giving an opportunity for the company to guess the author of each piece. One paper was called "What did Katy do?" The word "sun" to be inserted. Another, "Why is the darkest hour just before day," and "darling," to be inserted. Another, "Does the mewing of the cat make music to your ears?" and "dollar" was the word. "Where is the mother of vinegar?" with the word "charity." This was written late the night before, by a tired tiller of the soil, and who is one of your subscribers, so I'll quote it:

Long time ago, when but a child,
Before we sought this "Desert wild,"
I lived upon an orchard farm,
And knew full well its storm and calm.
I've seen the fruit trees bending low,
In burnished red, or white, like snow.
I've seen the patient oxen come
Drawing the cider apple home.
I've seen the horse go round and round,
And heard the squeezing, crushing sound,
As apples good and apples bad,
Like Charity, gave what they had.
But I'm so certain, I could swear,
Tho' cider turns to vinegar,
I did not see its mother there.
Well, time flew on, till hour by hour,
The cider sweet was cider sour;
Yet, e'er it turned to vinegar,
We never saw its mother there.
Maternal sweetness keeps things sweet,
And prof'table to drink or eat.
Maternal presence hath no power
To turn a thing from sweet to sour;
And hence, I urge, with lawyer's care,
There wasn't any mother there.
We strained the cider in a butt,
Sometimes 'twas sweet and sometimes not;
And all was done with so much care,
I'm sure there was no mother there.
But time sped on; 'tis Sunday morn,
The day on which baked beans are born.
We haste away for vinegar,
And lo! we see its mother there.
She hides there all this time, it seems,
With latent love, to bless our beans.
Then solve the problem if you can,
"The boy's the father to the man,"
Or, take it this way, if you'd rather,
Vinegar's parent to its mother.

In a conspicuous place in one of the rooms stood a man's silk hat with a bunch of flowers on one side. This attracted so much attention from the gentlemen during the evening, that ten dollars were found within its depths when the company had gone home.

And thus I give you a peep into one of our quiet country homes, at an evening's sociable or entertainment, and if I have helped to give any new ideas as to how the winter evenings can be spent, as well as how talents which lie dormant (and many times are unknown even to the persons themselves), can be used with profit and pleasure, I shall be well satisfied.

MRS. O. HOWARD.

TROUBLES AND TRIALS.

Mrs. Nason was busy with her sewing when her next-door neighbor sent her little son over to ask her to come and see her.

"Is your mother sick, Henry?" she asked.

"I guess so; she is crying like everything, and she wants you to come right over as soon as you can."

"Tell her I will come directly," she said, folding up her work and putting a stick of wood in the stove. "I cannot stop long as Mr. Nason will be at home in an hour for his tea."

Putting on her shawl she followed the little boy, and found his mother in a flood of tears, sitting before the sofa, which was piled with blankets and comfortables.

"My dear Mrs. Langtry, what is the matter?" she exclaimed, as she stepped to her side.

"Oh dear! what shall I do? Just look at my winter's bedding! Everything is ruined! The mice and the moths have just destroyed all!" and she burst out afresh in a paroxysm of grief.

"It is too bad!" said Mrs. Nason. "I am sorry for you!" and she opened a pile of soft, white blankets that were literally made into open-work by the insidious moths. "I should hang them out in the sun and frost as quick as possible," she quietly said.

"Then my nice comforts are all gnawed by the mice and full of nests! I never saw such work," sobbed Mrs. Langtry.

"Did you wash your blankets before you packed them last Spring?" asked Mrs. Nason.

"No, they were not soiled, and so I laid them on the shelves in the closet. I thought they would be all safe, of course, and the comforts I packed on the floor. I do not believe the closet door has been opened since I put them there! Did you ever see such work?"

"I never did, certainly! Did you put in something to keep the moths out; and cover them up tight? Of course you did though."

"No, I never thought of it. I was in a hurry, and I supposed they would all be safe till Fall."

"You packed your furs in camphor or tobacco, I hope. It has been a hard Summer for moths," said Mrs. Nason gently, as she shook out a mouse nest with half a dozen little mice, on the carpet.

"I don't believe I did. If my set of furs are spoiled won't Ed. Langtry give me fits! I will go and look at them and see," she said, starting up.

"I would take care of these things first, were I in your place, and get them out of the sitting-room. Time enough to-morrow to look after the furs. I am very sorry for you, but my dear woman, an hour's work and care, last May, would have saved you a heap of work this Fall. I see no way but you will have to get some soft yarn and darn the blankets as well as you can, and I reckon you will have to patch the comforts after you get the mousey odor from them."

"Did you ever see a woman have so many trials and troubles as I have? You know that my sheets and pillow cases all mildewed last August, and my table napkins too," and she began to cry again.

"My dear Mrs. Laugtry, you have no one to blame but yourself; you are always in such a hurry that you do not take time enough to properly care for things. If you had dried your clothes they would not have mildewed. Troubles that we bring upon ourselves should be a warning against such haste in the future. 'Haste makes waste,' is an old maxim and a true one, I find."

"Oh, you careful, moderate people are always on the safe side, I suppose," she said testily. "We generally avoid such troubles as these," was the reply, "and I find it pays to take care of what things I have. I am just as sorry for you as I can be, but I do not believe you will ever meet with such a disaster again. Trials and troubles that the Lord sends us we have to accept as inevitable and try to be resigned; but those which we bring upon ourselves through neglect, haste or carelessness, are not so easy to bear, for we know they were brought upon us by our own oversight."

"Now, do not give me a lecture, for my husband can do that! but help me carry these detestable things on the back porch. I wish the whole lot was burned up and out of the way."

"Poor woman! You will never learn wisdom," said Mrs. Nason, as she helped her neighbor clear the débris from the sitting-room.

MRS. S. H. ROWELL.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

PITHS.

Pansies are just now fashionable for dinner-table decoration. They are arranged in circles of color upon flat dishes or baskets.

A thoughtful, wise mother keeps pace with the development of her children.

Raisins will stone easier if first covered for a few moments with boiling water.

The tops of lamps require to be boiled every few weeks for half an hour in strong soda water. Do this if you would avoid explosions.

Garments worn at night should not be folded up and placed under the pillows.

GASTRONOMIC GOSSIP.

A DINNER FOR FEBRUARY.

Spring Soup.
Lobster Cutlets.
Breast of Veal, Jardiniere.
Curried Rice.
Salad ... Watercress and Beets.
Bavarian Cream.

It is quite true that "civilized man cannot live without dining"; but it is also true that he will not show any enviable degree of civilization unless he has dined well. The cynic who said that the road to a man's affections lay through his stomach, might have added that, like the "road to learning," it is not a royal one.

In view of the 365 breakfasts and dinners, not to speak of luncheons to be prepared for this New Year of our Lord 1886, you will agree with me, gentle housekeeper, that it looks a very weary one. The Rural proposes to give from time to time a series of bills-of-fare and culinary suggestions designed to relieve housewives of some of the share of the burden of catering.

In the early Spring, there is no better soup than the one named above. Make a stock, by boiling slowly for five hours, three pounds of shin of beef with three quarts of water; strain and let it get cold, in order to remove the cake of fat from the top. The next day, set the soup over the fire and add the following vegetables all finely chopped:—One small carrot, one turnip, also small, one good-sized onion, three tablespoonfuls of the thick part of canned tomatoes, two stalks of celery, and if you can procure it, a few teaspoonfuls of minced lettuce and watercress, and a little parsley. Boil slowly for half an hour, season to taste, and serve very hot.

Lobster cutlets can be made from canned lobster, although the fresh is always preferable. Put two ounces of butter into a stew-pan, and when it bubbles, stir in a heaping spoonful of flour; cook for a minute, and then pour in a small cup of boiling cream, and a half a pound of lobster cut in dice. Stir until very hot, take from the fire and add the beaten yelks of two eggs, salt to taste, add the least bit of grated nutmeg, and a dash of Cayenne; return to the fire and cook for a minute to set the eggs. Spread half an inch deep on a buttered dish to cool, then shape like chops, dip in bread-crumbs, then in beaten eggs, and again in bread and fry a golden-brown in hot drippings.

Have the butcher prepare a breast of veal for stuffing by making an incision between the ribs and the flesh, fill this with a force meat made of stale bread, a little stewed tomatoes, a boiled onion, and seasoning. Skewer the flap of meat into place, season well and put into a baking-pan with a cup of boiling water. Bake for an hour and a half basting frequently. A slice or two of fat pork laid over the meat adds to the richness of the gravy. Boil separately one carrot and one turnip and six button onions,; the two former should be cut in dice; heat in separate stew-pans half a can each of peas and string beans. Place the meat in the center of the dish, the vegetables in little mounds around it and pour the strained and the thickened gravy over the whole.

Boil some rice; fry a minced onion in a little butter until turning red, add a tablespoonful of curry-powder dissolved in a little stock, boil up once, and pour over the rice, shaking it well so as to mix it thoroughly with the rice. For those fond of curry, there is no more delightful accompaniment to baked veal.

A simple French dressing made by mixing half a teaspoonful of made mustard, and as much salt, with three tablespoonfuls of vinegar, and one of table-oil, and a salt spoonful of pepper, is the nicest for green salads. Salads are so healthful and refreshing that they should form a part of every dinner.

Bavarian creams are as delicious as they are simple, and where one has plenty of cream they are also cheap. Whip one pint of cream to a stiff froth, laying it on a sieve. Soak half a box of gelatine in a small cup of water for an hour, keeping it in a warm place near the range; stir into this one pint of boiling milk that has been sweetened and flavored with vanilla; let it cool slightly and stir in the well-beaten yelks of four eggs, when it gets quite cold and begins to thicken, stir it steadily until smooth, then stir in the whipped cream until well mixed; put in a mold and stand in a very cold place.

ELSIE.

HOME PHYSICIANS.

An amateur doctress may be very useful, provided she has sufficient intelligence not to overstep certain bounds. Ladies who are fond of dabbling in medicines, unless they know where to stop, may do much harm. There are many simple facts, however, that every mother should be acquainted with.

The woman who when beef-tea was ordered, put the beef in the tea-pot and poured on boil-

Miscellaneous Advertising.

The true cleanser is hot water, and only under the efficient action of hot water and a pure and effective Soap like the Ivory, can soiled garments be made to part with the oily refuse matter from the skin.

Free of charge. A full size cake of Ivory Soap will be sent to any one who can not get it of their grocer, if six two-cent stamps, to pay postage, are sent to Procter & Gamble, Cincinnati. Please mention this paper.

ing water, had no excuse for her ignorance. Of the many ways of preparing this popular form of nourishment for the sick, the writer prefers the following method, which is that of a celebrated physician. Cover one pound of lean beef with a pint of cold water; beat it with a silver fork for 10 minutes; place it over the fire and simmer for 20 minutes; strain and set aside to cool. When cold, remove the fat, which will have formed in little flakes on the top, heat, season with a little salt and serve with nice toast or thin wafers. The flatulency that sometimes follows the use of beef-tea, may be prevented by boiling a bit of bruised ginger with the tea.

In regard to poultices there is often a lamentable ignorance. A cold, clammy poultice is positively harmful. To make a linseed poultice, lay a piece of clean rag large enough to cover the required spot, upon a hot dish; meanwhile pour in a basin the desired quantity of warm water, scatter in the linseed meal, and stir with a knife until it is of the proper consistency. A sloppy poultice is damp and uncomfortable, and one that is too dry will not hold together. Spread over the rag evenly, and double it over an inch at the edges. Take it to the bed-side on a hot dish. Bind it on firmly with folds of bandaging and cover with a compress of flannel to retain the heat. A piece of oil-silk is less clumsy and will keep moisture from the bed-clothes. In the case of a bed-ridden person, a pailful of fresh, cold water kept under the bed will often prevent bed sores. Where these have formed, an old silk handkerchief tacked inside the garments will give a grateful feeling of relief and coolness. A MOTHER.

MATCH-HOLDER.

One of the prettiest Christmas gifts that I received was a match box made out of a little wooden butter tray, such as grocers give you when you buy small quantities of butter or lard, and two clay pipes. The butter tray is oval, painted black and varnished. The pipes are gilded, crossed and tied together with red satin ribbon so that the bowls set upward. These are secured to the tray by a few stitches through the ribbon that holds them together. One pipe bowl is intended for good matches, the other for those burnt. AUNT JANE.

RIBBON WASTE.

In reply to our inquiry as to where the above could be obtained, "Palmetto" writes:

The "ribbon waste" to which I referred in my article was obtained at one of the ribbon mills in Paterson, New Jersey. I presume it can be obtained at any mill where ribbons are manufactured. Floss in large skeins, and beautifully assorted colors for the embroidery, can also be had at the silk mills for 30 cents an ounce.

DOMESTIC RECIPES.

FIG PUDDING.

An economical fig pudding is made as follows: Chop fine half a pound of figs, and four ounces of suet, add eight ounces of bread crumbs, six ounces of brown sugar, two ounces of flour, a gill of milk and a little grated nutmeg; stir all these well together and add two beaten eggs; put into a buttered mold and boil for four hours. A plain and cheap pudding sauce is made by stirring into a pint of boiling water, a tablespoonful of corn-starch dissolved in cold water; add one cup of sugar, and two ounces of butter; flavor to taste with nutmeg, lemon-rind, cinnamon, brandy, or wine. A sauce made from the juice of tart canned cherries is especially nice for fig pudding which is rather insipid if it has not a rich and at the same time a sour sauce. Use as above, substituting the juice for the water.

MARY L.

MEAT CAKES.

The remains of a cold roast or boiled leg of mutton that has been rarely cooked, will be most delicious if prepared as followed: Chop the meat as fine as possible and mix it with half as much fine bread crumbs, and a quarter as much beef-suet, also chopped very fine and freed from strings. Put these ingredients into a bowl, with a cupful of minced oysters (fresh ones of course are best but the canned ones may be used), add a seasoning of thyme, marjoram, pepper, salt, and a little powdered mace; mix with two well-beaten eggs for a pound of the cold mutton; stir until it forms a stiff paste; form into balls or sausages and fry. MRS. A. M. FOSTER.

HASHED GAME.

Cut the remains of cold roast duck, partridge, or any kind of game into small pieces and dredge them well with flour; put them into a stewpan with a half cupful of stock and a tablespoonful of mushroom, catchup or some kind of table sauce; season with salt and red pepper and let it simmer very slowly for ten minutes. Lift out the pieces with a colander spoon, and lay upon nicely-browned toast. Put a few drops of lemon-juice into the sauce, boil up once and pour it over the whole. The pickings of cold game that could be used in no other way, fixed as above make a very tasteful breakfast or supper dish. If no stock is handy a little may be made by boiling the bones for half an hour with a small onion, and the usual seasonings. FANNY L.

BAKED INDIAN PUDDING.

The following is a reliable though somewhat expensive recipe for the above dish, but it is most delicious: Take one pint of yellow Indian meal and stir into it a quart of boiling milk. Let four ounces of butter melt slowly by the fire, and mix it with a pint of molasses; flavor with nutmeg and the grated rind of a lemon, and stir very gradually into the milk and meal; when almost cold stir in quickly six well-beaten eggs. Pour into a buttered pudding dish, and bake from one-and-a-half to two hours.

For a more economical pudding that is still quite good enough to be relished by hungry children and grown people too, we can recommend the recipe given below: Into seven tablespoonfuls of corn-meal stir one quart of scalding milk, a cupful of molasses, a teaspoonful of salt and a tablespoonful of ground ginger. Bake covered for two hours in a slow oven; remove the cover and brown for half an hour, increasing the heat of the oven.

M. A. B.

PRESERVING EGGS FOR FAMILY USE.

The following preparation I have used for 40 years for preserving eggs, without the loss of half a dozen a year. I do not pretend that eggs so kept are equal to fresh eggs for the table, but for all cooking purposes they are perfectly preserved. They not only keep good through the Winter, but I have taken them out 18 months after putting them in the brine and found them good. I use for the purpose two large butter tubs, so that while using from one I can be putting them down in the other. I prefer eggs laid in the months of May, June, September and October as most likely to be in good condition for keeping.

One pound of fresh unslaked lime, one pound coarse rock salt and three gallons of soft water. Twice this quantity will preserve from 20 to 25 dozen eggs. The ingredients should be prepared two or three weeks before using, stirring frequently so that the lime will be thoroughly mixed, as the heat evolved from slaking would harden the yelks of the eggs. When properly prepared, there will be a thin crust on the liquid like thin ice, and as long as there is a crust on top, eggs may be put in and taken out as needed. The shells will be slightly coated with lime. No straining is necessary. Mix the ingredients in the vessel you intend for the eggs and let the *cream* remain in the bottom after it has been stirred for a sufficient length of time. MARTHA.

REMEDY FOR BED-BUGS.

CORROSIVE sublimate, pulverized and mixed with lard, and applied to cracks and joints of bedsteads, is a life-long remedy of mine for these pests. I never put up a new bedstead without giving it a dose of preventive, and, during almost 50 years of housekeeping, have never had an insect in one of them. C. M. H.

WHAT OTHERS SAY.

M. E. DEWEY, in Good Housekeeping, says of hospitality that we may fairly acknowledge that to have visitors in one's house demands the sacrifice of our leisure, our attention, our little personal "ways" that are so dear to us, and that, notwithstanding the exquisite pleasure of close intercourse that often comes to us in this way alone, a large part of our care as hosts is spent upon people who are only moderately interesting to us, and sometimes upon those who require our utmost patience and indulgence to put up with them all.....

THE same writer, with rare good sense, suggests that if a friend comes in upon a homely or scanty dinner, that we eke out the meal with bread and butter or a jar of canned fruit, and say nothing in deprecation.....

CHRISTINE TERHUNE HERRICK says that the addition of a couple of teaspoonfuls of ammonia to the suds in which dish towels are scrubbed does no harm, and assists materially in the removal of dirt. The towels should never be boiled until washed thoroughly. Otherwise boiling sets the stains.....

G. O. GAINES, in Albany Cultivator, says that a child at first learns only by inquiring, but that in many cases, the members of a family cannot, or will not, take time to answer the hundreth part of the puzzling questions that rise in the busy brain of the little student. But, absurd and irrelevant as these inquiries frequently seem, it is unwise to turn the juvenile questioner away without at least attempting a sensible and definite reply, and that it will pay to furnish what information we can to an eager, curious child.....

News of the Week.

HOME NEWS.

SATURDAY, Jan. 30, 1886.

THE House Committee on Military Affairs has favorably reported a bill appropriating $500,000 for the New York monument to Gen. Grant, the money to be available when voluntary subscriptions shall have reached $250,000. Many believe the National Monument should be in the National Capital.....On Jan. 10 Capt. Crawford, of the U. S. Army, while hunting hostile Apaches in the mountains of Sonora, came upon a party of Mexicans who fired on the Americans, killing Crawford. Our troops returned the fire killing four of the enemy. Geronimo was completely tired out by Crawford's relentless pursuit, and he surrendered hostages to Lieut. Maus who succeeded Crawford, and would have surrendered his entire band had Maus been able to grant terms of surrender. The matter is to be referred to Gen. Crook.....Owing to the law's outrageons delays in criminal cases, and the probability of the escape of notorious criminals through legal technicalities and mawkish sentimentality, "Judge Lynch" has been remarkably busy of late in a great many parts of the country. Indeed, there has been a good deal of talk of introducing his summary administration into several cities and large towns where crime by far too often goes unwhipped of Justice.....Mrs. Crag Wadsworth, who it was currently reported, three or four years ago, was about to marry President Arthur, died Wednesday.....Petitions for the reappointment of O'Donnell as State Railroad Commissioner of this State, are pouring in clonds upon Governor Hill from all classes of the community. Some farmers' associations, however, are opposed to him; but it would seem the majority are in his favor.....The railroads of Texas are indebted to the State for money due to the School Fund to the amount of $1,650,000.....American vessels are not allowed to carry passengers between one Canadian port and another, and a bill is now before Congress prohibiting Canadian vessels from carrying passengers between one of our ports and another.....John C. Kimball, his wife and three children, on their way home from Dodge City, Kan., were caught in a blizzard and frozen to death last Wednesday.....The bill authorizing the President to reinstate General Fitz John Porter as an officer of the army has been favorably reported from the Military Committee. It is proposed to restore him to the rank he held when cashiered, and put him on the "retired" list, with the pay, etc., of the position; but no "back pay" is to be allowed.....J. A. Chapleau, the Canadian Secretary of State, announces that an amnesty is to be extended to all political prisoners of the Northwest. The Indians are not included. The Indians of the Northwest have no vote.....The Chinese in Cloverdale, California, have been ordered to leave town within 48 hours, owing to excitement caused by the murder of a lady by her Chinese cook. "Anti-Chinese" organizations are being formed throughout the State, and the war against the pig-tailed race has received a lively impetus.

THOSE who have used the Boss ZINC and LEATHER COLLAR PADS and ANKLE BOOTS say they are the best and cheapest, because most durable. They will last a life-time. Sold by harness makers on 60 days' trial. DEXTER CURTIS, Madison, Wis.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, Jan. 30, 1886.

THE Sixth Annual National Agricultural Convention of the American Agricultural Association will be held at the Grand Central Hotel, New York, February 3d, 4th and 5th, 1886. All interested in agriculture and kindred pursuits are invited to attend and participate in the proceedings. Addresses will be delivered and papers read by the leading thinkers and writers on agriculture, live stock, dairying, ensilage, and other practical subjects, and there will be open discussions of each by the members.....A Convention of the National Dairymen's Protective Association will be held at the Grand Central Hotel, New York, Friday, February 5th, 1886, to which all friends of the dairy are invited. The object of the convention is to give expression to the sentiment against the manufacture and sale of fraudulent butter, and to consider means for the protection of dairymen and consumers against this gigantic evil.....Fifty million dollars' worth of gold has been shipped from British Columbia since 1858. The export last year was $595,000.....A farmer in New Hampshire has been fined for cruelty in not providing shelter for his cattle during the late cold weather. He was the richest man in the neighborhood.....White people of means and education are said to be leaving West Virginia, Ohio, and parts of Western Pennsylvania for Arkansas, their intention being to carry on farming extensively in the most productive and healthy sections of that State.....The fruit-growers of California are petitioning Congress not to pass the Mexican reciprocity treaty, as the competition it authorizes would greatly injure their business. They say that the present duty of 35 per cent. ad valorem on prunes, two cents per pound on raisins, and $1 per gallon on olive oil, affords no real protection to these enterprises. Congress is therefore asked to raise the duty on prunes to 50 per cent., on raisins to three cents, and on olive oil to $3, and to decline to ratify the treaty.....The Danish Government has been urging a protective duty on imported sugar and corn. That on corn would have prevented any American importations—they don't amount to much anyhow—but the Lower House of Parliament has rejected the Government's bill.....Mr. Pierre Lorillard, the most conspicuous figure on the American turf, is about to retire from it permanently. His famous racers are to be sold, but his great horse breeding establishment at Rancocas, N. J., is to be retained. His desire to give more attention to this and his large business interests, is the cause of his retirement.....The Connecticut Legislature, last Thursday, passed a resolution calling upon Congress to increase the duty on leaf tobacco so as to protect tobacco raising in the "Nutmeg" State.....The aggregate receipts of wool in Boston since January 1, 1886, have been 14,987 bales domestic, 2,639 bales foreign, against 14,245 bales domestic and 667 bales foreign for the corresponding period of 1885.....Hogs are still dying in great numbers around Beloit, Wis. Over 10,000 it is estimated, have lately died within a radius of 15 miles of the city—measles, it is thought.....The Atchison, Topeka and Santa Fé Railroad Company, it is said, will establish stock-yards and erect large packing-houses at Argentine, adjoining Kansas City, Mo., in connection with its projected lines into Indian Territory and Texas. The company, it is said, contemplate building 400 miles of road, to have ready for the moving of cattle next year, from Kiowa through the Territory to the Texas Pan-handle, and from Arkansas City, Ark., toward Fort Worth, besides short feeders to its lines.....New Orleans refuses to buy the Exposition buildings for the proposed $125,000. The thing must collapse soon, therefore, unless another raid on the city treasury shall prove more successful.....This is the severest Winter Scotland has had in 20 years. Sheep in great numbers are perishing from starvation.....The Randolph Peters Nursery Company was organized at Wilmington, Del., on the 28th of January. Sarah A. C. Peters was elected President and John S. Barnhard, Treasurer and Manager.....The House Committee on Agriculture has determined to recommend the establishment of a Department of Agriculture and Labor with a Secretary, who shall be a member of the Cabinet, at its head.....A largely attended cattlemen's convention is now being held at Denver, Col. Revision of the land laws for the interest of stockmen and the leasing of the "arid region" in large bodies, to stock owners are strongly advocated.....Heavy rains followed by severe frosts caused a heavy formation of ice on the trees in many parts of Massachusetts and Maine, last Thursday, and the disfigurement and destruction, due to the breaking down of trees and branches under the load, have been heavy and widespread.....Our New York readers should not forget the State Farmers' Institute to be held at Ithaca, N. Y., February 16th, 17th and 18th. Dr. Caldwell assures us that reduced rates are promised by the railroads and hotels. Let there be a grand rally.....

For a full illustrated Description of our Free Seed Distribution for 1886, examine the Nov. 14 issue. Preserve it for future reference. It is sent to all applicants for specimen copies.

THE MICROSCOPE raised the standard of Thatcher's Orange Butter Color until three eminent experts in New York State reported good enough.—*Adv.*

Crops & Markets.

SATURDAY, Jan. 30, 1886.

A cablegram from Rangoon, Burmah, says the exports of rice will be fully a million tons—nearly 15 times the whole product of the United States. It is thought, however, that the report is intended to depress other rice markets; for owing to the late disturbances it is not unlikely that the crop will be less than usual. Now prices of foreign rice are 12 to 15 per cent. lower than in 1882, when the crop was larger than the present estimate. This is due to competition with other low-priced cereals and to the fact that we now raise nearly enough to supply the home demand, except for brewery purposes, for which "broken" rice is used. Prices of domestic rice are unusually low, so that the crop is entering into consumption much more rapidly than usual, the sales to date being 300,000 barrels against 125,000 for the some period last year. The medium grades of domestic are about half a cent a pound lower than the same grades of foreign at this place, but Western buyers by purchasing at primary markets save nearly twice that difference.

THE forthcoming report of the Illinois State Agricultural Department on the amount of wheat raised and consumed during the year 1885, will show a condition of affairs not known to exist for the past 35 years, there being a deficit of 5,000,000 bushels in the crop. The acreage harvested was 1,068,364. The amount annually required for seed and consumption is 13,739,029 bushels, but the amount produced, as shown by the returns, was 8,299,243 bushels. Of the 102 counties in the State only 23 report a surplus in production over the demands for seed and consumption. These counties are not located in any particular belt, but are scattered throughout the State indiscriminately.

The Minneapolis flour market is somewhat brighter; and were it not for low water all the mills would be in operation. The production for the week was 90,648 barrels, against 72,366, the preceding week, and 97,000 the corresponding week in 1885. Receipts of wheat for the week, 404,880 bushels; shipments, 26,880 bushels of wheat, and 77,875 barrels of flour. Wheat in store—Minneapolis, 5,951,485 bushels; Duluth, 5,567,571; St. Paul, 1,172,000.

Reports from leading peach growing sections along the Hudson River Valley show that the buds were killed when the mercury went down as far as 16 below zero. This is the third total failure of the peach crop in three consecutive years. The prospective loss to Ulster County is estimated to exceed $150,000.

Eggs here are lower again. A few weeks ago, the price went up to 29 cents, but now they are dull at 23. Little probability of higher prices, unless the weather changes. The condition of the egg market may be seen from the following figures, giving prices for the different periods of late years. The number of eggs on hand this year is greater than ever before. These prices are for fresh State eggs:

	Jan.	Feb.	Mar.	Dec.
1886	27	22½		
1885	30	33	28½	28
1884	33	37	25½	28
1883	31	30	27	31
1882	34	28	31	33
1881	34	47	22	35
1880	25	20	15	33

It will thus be seen that eggs reached their lowest point in price in 1880, and their highest in the following year. The prices realized this year are far below the average. This is partly due to the fact that the egg market has changed of late years. Most of the eggs quoted are brought from a distance. The "near by" and State eggs are mostly sold direct to private customers at far better prices. Large quantities of Western eggs find their way into this market. Most of these are shipped well, packed in barrels with cut straw. The patent egg cases appear to be used mostly for near-by lots. Fresh eggs are carefully tested as soon as received. When held before a candle in a dark room, an experienced tester can tell at a glance the quality of an egg. A good hand can easily test 10 dozen per minute. Eggs are retailed at present at 10 for 25 cents. There is not much profit for the handlers. Many limed eggs are sold. They are generally considered fair for cooking purposes, but are worthless for boiling, as the shells fall in pieces. The greatest sale for limed eggs is found among the restaurant keepers. In some markets, there is a special craze for brown eggs. Many persons believe that a brown shell betokens an extra richness of the contents. In some markets, dealers have resorted to the practice of coloring eggs with a brown preparation in order to deceive customers. In many cases these colored eggs gave such good satisfaction that the whole theory was exploded. In this market, color appears to have less influence than it does in the Boston market. People naturally pick out the largest. A long, narrow egg gives one an idea of extra size and is generally chosen in preference to a solid egg, which really contains more nutriment. Tastes differ with regard to eggs from different breeds. One dealer finds Leghorn eggs the most salable, while others are anxious to obtain Plymouth Rock or Brahma eggs. At the fashionable clubs and restaurants, Game eggs are considered most palatable. Bantam eggs find good sale in the same places and are considered excellent. Where a fashionable market can be secured, the Bantam will give as large a percentage of profit for food consumed as any breed known. Great numbers of eggs are sold at five cents each; we know of families paying 90 cents per dozen. Such eggs are delivered every day a few hours after being laid. They are guaranteed absolutely fresh and pure; a single stale or ill-shapen egg would ruin the business. The greatest care is necessary in producing and delivering. Poultrymen who serve these fashionable customers frequently mark each egg with the date of its production. If an egg should turn out badly with this mark upon it, the dealer's reputation would be ruined. As in the case of "gilt-edged" butter, people pay an extra price for the assurance that the article is honest.

The Cincinnati Price Current of Thursday says: The number of hogs packed in the West last week was 290,000, compared with 270,000 the same week last year. The total to date since November 1 is 5,255,000 against 5,265,000 last year. The movement at the principal points since November 1 is as follows:

Chicago	2,085,000	Indianapolis	242,000
Kansas City	563,000	Cedar Rapids	159,000
Cincinnati	311,005	Louisville	121,000
St. Louis	295,000	St. Joseph Mo.	109,000
Milwaukee	270,000	Cleveland	57,000

Brown's Bronchial Troches will relieve Bronchitis, Asthma, Catarrh, Consumptive and Throat Diseases. *They are used always with good success.—Adv*

MARKETS BY TELEGRAPH.

SATURDAY, January 30, 1885.

CHICAGO.—Compared with prices a week ago, "regular" wheat is 3¼c. higher; No. 2 Spring, 1¾c. higher. Corn, ¼c. lower. Oats, ¾c. higher. Pork, 20c. lower. Cattle, a shade lower. Hogs, a trifle lower. Sheep, somewhat higher.

WHEAT.—January, 80¾@81¾c; February, 80¾@81¾c; May, 86¾c@87½c.; No. 2 Spring, at 82c.; No. 3 Spring, at 70c. CORN.—Steady and quiet; Cash, 36½c; January, 36½@36¾c; February, 36¾@36½c. May, 40¼@40¾c. OATS—Firm; sales ranged; Cash, 29¾@30c; January, 29¾@30c; May, 31¾@32c. RYE—Dull; No. 2, 58c. BARLEY.—No 2, 60@61c. PORK.—Quiet; Cash, $10 75@10 80; January, $10 77½@10 80; February, $10 75@10 87½; May, at $11 07½@$11 12½. LARD.—Firm; sales ranged; Cash, $6 10@6 12½; January, $6 10@$6 12½; February, $6 10@$6 12½; May, $6 27½@6 30. BULKMEATS.—Shoulders, $3 95@4 00; Short rib sides, $5 27½@5 30; Short Clear sides, $5 65@$5 70. CATTLE—Market slow; Shipping steers, $3 50@5 65; stockers and feeders, $2 50@4 00; cows, bulls and mixed, $1 80@4 00; bulk, $2 00@3 10. HOGS.—Market strong; rough and mixed, $3 65@3 95; packing and shipping, $3 95@4 35; light, $3 40@4 05; skips, $2 60@3 60. SHEEP.—Market firm; Natives, $2 50@4 85; Western, $2 50@4 00; lambs, $4 00@4 75; Texans, $2 00@3 75.

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, January 30, 1886.

STATE OF THE MARKET.—Compared with cash prices last week, flour is higher on inferior grades, steady on best; "regular" wheat 2¾c. higher; corn 1c. to 1½c. lower; oats 1c. lower; beans steady; pork steady; butter steady on best grades, a shade lower on others; cheese unchanged; eggs lower and dull; poultry unchanged; cotton ⅛c. lower; fruit unchanged; vegetables steady. The wheat market still goes up and down from day to day. Large shipments of eggs are noted. The fruit and vegetable markets hold prices remarkably well. Compared with prices last year at this time, potatoes are from 25c. to 50c. per bbl. higher; sweet potatoes are 75c. lower, while cabbages, onions and squash are all higher. Apples are about the same as last year.

FLOUR, FEED AND MEAL. FLOUR—Quotations: Fine at $2.15@$2.85; Superfine, $2 75@$3 25; Extra No. 2, $3 15@$3 60; Good to Fancy Extra State, $3 60@4 25; Common to Good Extra Western at $3 15@$4 00; Good to Choice Extra Western, $4 00@$5 65; Common to Fair Extra Ohio, $3 15@$3 75; Good, $3 80@$4 20; Good to Choice, $4 25@$5 25; Common Extra Minnesota, $3 15@$3 65; Clear, $4 10@$4 50; Rye Mixture, $4 00@$4 25; Straight, $4 50@$5 00; Patent, $4 75@$5 65; Bakers' Extra, $4 10@$4 75; St. Louis Common to Fair Extra, $3 15@$3 80; Fair to Good, $3 85@$4 75; Good to Very Choice, $4 80@$5 50; Patent Winter Wheat Extra, $4 50@$5 60; City Mill Extra for West Indies, $4 85@$4 95; South America, $5 00@5 10. SOUTHERN FLOUR—Common to Good Extra at $3 85@$3 80; Good to Choice do., $3 85@5 40. RYE FLOUR—Superfine, $3 25@3 50; fancy, $3 55. BUCKWHEAT FLOUR, at $1 90@$2 00. CORN MEAL—Brandywine, at $3 00@3 15; Yellow Western, at $2 80@$3 15. FEED—Bran, 60 lb. average at 80@82½c.; 80 lb. average at 80@82½c.; middlings at 80@90c., and sharps at $1 00@$1 10. Rye feed at $17 00 per ton.

GRAIN.—WHEAT.—Ungraded Red, 84@91¼c.; No. 2 Red, 93¾c; No. 2 Red for February, 90¾@91¾c.; do. for March, 92@92¾c.; do. for April, 93¾@91¾c.; do. for May, 94¼@95¾c; do. for June, 95¾@96¼c; do. for December, 1.02@$1.03. RYE—60@62½c. for Western, and 64@65½c. for State. BARLEY Ungraded Canada at 81½@86c; Two-rowed state, 71c. CORN—Ungraded Mixed, 47@49c; Steamer Mixed, 47¾@48c.; No. 2, Mixed, 49¾c.; Yellow, at 50¼c. in elevator; No. 2 Mixed for January, 50c.; do. for February, 49¾@49½c.; do. for March, 48¾@48¾c; do. for April, 48¾@48½c; do. for May, 48¼@48¾c. OATS—No. 3 Mixed, at 37c.; No. 2, 37¾@38c.; No. 1 nominal at 38c.; No. 3 White, 39¼c.; No. 2 do. 40¼@40½c; No. 1 at 43c.; Mixed Western, at 37@39c.; White do., 39@43c.; White State, 42c; No. 2 Mixed for February, 37⅜@37¾c.; do. for March, 37½c; for May, 37¾c.

BEANS.—Quoted: Marrows at $1 50@$1 55; pea at $1 50; red kidney at $2 00 for choice; turtle soup at $2 25; white kidney at $1 95@2 00 for choice.

PEAS.—Green are quoted at $1 15.

PROVISIONS.—PORK.—Mess quoted at $10 37½@$10 75; $11 00@$11 50 for Family Mess; $12 00@$13 50 for Clear Back; and $8 50@$9 25 for Extra Prime. BEEF.—City Extra India Mess, $17 50@$18 00; Extra Mess, bbls., $10; Packet, $11 00@$12 00 in bbls.; Family Mess, $12 00@$13. BEEF HAMS.—Quoted at $16 50. CUT MEATS.—Pickled Bellies, 12 lb, average, 5½c; Pickled Shoulders, at 4¼c.@4¾c.; Smoked shoulders., at 5@5¼c.; Pickled Hams, at 8¼@8½c.; Smoked do., 9¼c. MIDDLES—Long Clear in New York quoted 5¼c. for Western delivery. Long Clear, 5.15c.; Short Clear, 5.60c. DRESSED HOGS.—City Heavy to Light, at 5@5¼c.; Pigs, 5¾c. LARD.—Western steam, 6.47½c. January, 6.45c; February, 6.45@6.46c.; March, at 6.46@6.47c.; April, at 6.52@6.53c.; May, at 6.58@6.59c.; June at 6.65@6.67c; August, 6.76@6.78c; city steam, 6.35@6.40c; Refined Continent at 6.70c, and South American, 7.00@7.05c.

BUTTER.—Eastern Creamery, 34@35c; Western Creamery, 18@33c.; Elgin do., 35c.; State Dairy half-firkin tubs, 18@26c.; Western Factory, 11@18c.; Imitation Creamery, 18@26c.; Western Dairy, 12@22c.

CHEESE.—State, 7@10¼c.; Night Skims, 5¾@7c. Western flat, 7@9½c.

EGGS.—State, 22@22½c.; Western, 21½@22c.; Southern, 21½@22½c.; Limed State, 18@19c.; do. Western, 18@19c.

LIVE POULTRY.—Chickens, 7@8c., fowls, Jersey State and Pennsylvania, per lb, at 10c.; do. Western, 9 lb, at 9@10c.; turkeys, per lb, at 9@10c.; ducks, western per pair, at 70@90c.; geese, western, per pair, at $1.25@$1.75; pigeons, per pair, at 40c.

DRESSED POULTRY.—Turkeys, Philadelphia, at 11@12c; 10@12c per lb for Jersey, and 10@11c per lb for western chickens, Philadelphia large, at 13c. per lb; do. small at 11@12c.; Jersey scalded at 10c; do, State at 9@9½c; do. western, at 9c.; fowls, Philadelphia, prime, 10@11c; do. Jersey at 10@11c.; State and western, 8@9c. Ducks, Philadelphia, at 14@15c; do. Jersey, at 13@14c; do, western, at 11@13c. Geese, Philadelphia, at 12@13c; do, Jersey, at 10@11c; do, western, at 10@11c.

GAME.—Quail, ₱ doz., $2; partridges, State and Pennsylvania, choice, per pair, at 90@$1; do. Easiest Riding Vehicle made. Rides as easy with one person as two. **The Springs lengthen and shorten** according to the weight they carry. **Equally well adapted to rough country roads and fine drives of cities. Manufactured and sold by all leading Carriage Builders and Dealers.**

☞ECLIPSE☜

POST HOLE DIGGER.

The **Greatest LABOR-SAVING** tool ever invented for digging holes in the ground. This machine works on a new principle, and is unlike anything in the market. It is neither an Auger nor a Plunger, but is driven in the ground with a driving rod, which works in a pipe similar to a telescope. **We claim** for this tool:

1st. That one man can dig from **two to three hundred** holes two in ordinary ground in one day.

2nd. That it will dig holes any **size** or **depth** required.

3d. That it will work successfully in **very hard** or **rough** ground where other diggers and augers will not work at all.

4th. You stand up straight while using it, consequently no back-breaking work is required.

It will pay you to send for descriptive circulars and prices to **COLE & FLEMING, Manufacturers, Springfield, O.**

THOMPSON'S CLOVER & GRASS SEEDER

WHEEL-BARROW

The only machine that will successfully sow Clover, Timothy, Hungarian, Millet, Red Top and Flax. Indispensable in windy weather when impossible to sow by hand. Send for circular describing latest improvements. Man'f'd by **O. E. THOMPSON, Ypsilanti, Mich.**

Simple and durable in construction. Feed positive and uniform.

LINSEED MEAL.

ABSOLUTELY THE BEST FEED FOR

CATTLE, HORSES, **CALVES,** SHEEP AND HOGS.

This Meal is the product of pure sound Flaxseed. Linseed being its other name, and is the most nutritious of all feed, because it contains the largest proportion of nitrogenous substance.

It is almost needless to say that, in order to derive much benefit from the use of Linseed Meal, it must be fed in quantity. At least one-half of all an animal consumes may safely and profitably be LINSEED MEAL.

☞Please send in a sample order or for circular and prices. Orders will be promptly filled by any one of the following parties:

Cleveland Linseed Oil Co., Cleveland, Ohio.
Toledo Linseed Oil Co., Toledo, Ohio.
Detroit Linseed Oil Co., Detroit, Michigan.

DARNELL'S PATENT FURROWER & MARKER

Leaves the earth well pulverized at bottom of furrow. Marks any width from 2½ to 5 feet, and from a mere mark to 6 inches deep.

"Take pleasure in recommending it. It does the business; is well made and will last for years." *J. S. Collins, Moorestown, N. J.*

"It far exceeds my expectations. If the real merits of this cheap implement were known to potato growers alone, the sales would be immense." *E. L. Coy, Pres. Wash. Co. (N. Y.) Agr. Society*

H. W. DOUGHTEN Manufact'r. **Moorestown, Burlington Co., N. J.**

For the Young.

BE sure that the cattle have plenty of salt this Winter. Animals need salt and they never can do well without it. It is absolutely necessary for them. Sometimes men are obliged to go without salt for a long time. They say it causes them the most awful suffering. In some countries prisoners are punished by being deprived of salt for a long period. All of their food is cooked without salt. For a time they stand it pretty well, but at last they begin to suffer. During the war, people at the South tried all sorts of plans to make salt. People have told me how they used to dig up the earth at the bottom of the smoke-houses and boil it to get at the salt that had soaked into it. In this way they got along. All you boys, whose duty it is to salt the cattle, must remember that it will not do to slight them. Take time for the work and do it well.

IN a great many districts there is a high hill near the school house, that gives a fine chance for coasting. The boys are generally quick to see this. The fun is so great that they sometimes seem to forget what they go to school for. I have seen boys half way up the hill when they heard the school bell ring. What do you think they did? Stop where they were and slide back to the school-house, or run on to the top of the hill and thus get the whole coast? What would you do? It is harder to stop and go back, but the spirit that makes one do it is the spirit that we want to see in our coming men and women. Don't be too anxious to think you know more than other people do. Everybody we meet can teach us something. We learn the most, make the best friends and have the best times by doing what is right and minding those who are placed over us.

IT would be a fine thing if we could have a good literary society in every district where the RURAL goes. The teacher will be a good person to start the work. It will do us all good to have practice in speaking, writing, and talking. Winter is the best time for this work, for then we have more time and people can come out. Such farmers as our boys and girls are going to make will need to be able to speak and write well.

THIS cold weather ought to teach us a good many lessons. If we have to dig wood out of the snow, if the wind comes in around the windows, if the cellar is not banked up, if the stock and poultry stand shivering about, if we have no flowers to make things pleasant, we ought to make up our minds that this is the last Winter we will be caught in this way.

LETTERS FROM THE COUSINS.

UNCLE MARK: I should like to be counted in among the Cousins of the Club so I will write you a letter and tell you who I am and what I am doing. I am 15 years of age and go to the Denver University. I am well pleased with the school. The first term has just closed and I have come home to spend the holidays. I had to ride 436 miles to get where my father lives on a fruit farm. Leaving Denver on the Denver & Rio Grande R. R. at 7.40 A. M., I started for Fruita, 436 miles away, in the midst of a snow storm. Going up the Divide between the Platte and Arkansas Rivers, we reached the summit where there is a beautiful lake called Palmer Lake. Going down the Divide we had a change of weather, instead of being cold and snowy it was as warm and pleasant as in Summer. Passing through the beautiful town of Colorado Springs, we journeyed on to Pueblo, where we stopped 20 minutes for dinner. Leaving Pueblo, we soon reached and passed by Canon City and its beautiful apple orchards, entering the grand Canon of the Arkansas, and it truly was the Grand Canon. On both sides solid masses and walls of rocks reaching up to thousands of feet and on one side the water, rushing, foaming and leaping madly on, found its way to the Mississippi and thence to the Gulf of Mexico.

Following the beautiful valley of the Arkansas, we reach Salida the end of the first and the beginning of the second division of the R. R. Here we change conductors, firemen, etc. Putting on another engine we begin the ascent of Marshal Pass, and by constant windings and curves past some of the most beautiful scenery, we stand on the top of Marshal Pass, 11,000 feet above the sea. The run down the western slope is soon made, and whizzing down some of the most beautiful scenery, we reach Sargenee where a bountiful supper is awaiting us. Here we enter the Tomichi valley and soon reach Gunnisou City and the Black Canon of the Gunnison, which is grander and more rugged than the Grand Canon of the Arkansas, even. Passing through it we reach Grand Junction. Here we again change engines, as this is the end of the second section. Soon we reach Fruita the end of my journey, and lying in the Grand Valley, which is especially adapted to fruit raising. In this valley we raise peanuts and chufas and, in fact, it is the only valley in which peaches and apricots are grown successfully. The railroad still goes on until Salt Lake is reached, where a few minutes ride takes us to the Great Salt Lake, the largest body of salt water in America. If a boy is any judge of the scenery through which the railroad passes it may be rightly named the Scenic Line of America, and if the Cousins wish to know about it and Colorado, I will write again. E. A. PABOR.

Fruita, Colorado.

[I wish we could all take such a trip together. We shall want to know more about Colorado. —UNCLE MARK.]

DEAR UNCLE MARK: I have not written for a long time, and now I have something to write about. It is a magic lantern. We have tried it and shown it to many people. We have over 100 pictures on slides. We can show many photographs and show them well. My Guinea pig has died of old age. He was four years old. He kept the mice away and liked all of our cats. There were six of them. He used to lie down by the side of all of them. My white rats I gave away for the magic lantern. There were a male and female rat and they had four little rats. Would you have given them away for the magic lantern? Papa said if I would give them away he would get it for me. I want to know why Cousins don't write to each other? I want to hear from them. Yours truly, RALPH SAWYER.

W. Medway, Mass.

[I think you did well to let the white rats go. The lantern must be much nicer. I don't like rats in any way.—UNCLE MARK.

DEAR UNCLE MARK: I live in the city of Louisville, but I spend vacation at Grandpa's in the country. He gave me some ground and I raised some celery, potatoes, tomatoes and a watermelon which weighed 42 pounds. My uncle planted it. I wish to join the club. Grandpa is going to give me a larger piece of ground next Spring. I will have to go out sometimes on Friday, after school, to get the ground ready for early vegetables. I like the country better than the city, and I want to be a farmer when I am a man. I will be ten years old next month. HARRY B. STILZ.

Louisville, Ky.

[That's right. I am glad you want to be a farmer. I hope you will make a good one.—UNCLE MARK.]

DEAR UNCLE MARK: I want to join your Club. I am a little girl seven years old. My brother and sister read the letters to me. I want them to join but they do not, so to-night while they are gone I have been telling my mother what to write for me as I can only write a few words; have never been to school. Thought I'd tell you we live on Hardscrable farm near Lawrence, Kan., have two horses, one colt, 30 head of cattle, some hogs and pigs, a few turkeys, about 150 chickens, several cats, some of them great pets. My cousin and brother take care of the stock. My mother makes butter, her butter took the blue ribbon at the Fair. My sister's sewing took first premium too; my sewing took premium last year. I am learning at home how to read, write, spell and add, so perhaps I can write a letter myself next time. MARY R. BROWN.

[Yes, indeed, you shall join and you must thank your mother, for me, for writing such a nice letter. I shall be glad to get a letter from you in your own handwriting. You must be quite a little seamstress. If you could be here I believe you would do some sewing for me. There is a loose button on my coat now. U.M.]

Catarrh Cured

Catarrh is a very prevalent disease, with distressing and offensive symptoms. Hood's Sarsaparilla gives ready relief and speedy cure, as it purifies the blood and tones up the whole system.

"I suffered with catarrh 15 years. I took Hood's Sarsaparilla and now I am not troubled any with catarrh, and my general health is much better." I. W. LILLIS, Chicago, Ill.

"I suffered with catarrh six or eight years; tried many wonderful cures, inhalers, etc., spending nearly one hundred dollars without benefit. I tried Hood's Sarsaparilla and was greatly improved." M. A. ABBEY, Worcester, Mass.

KNOW THYSELF.

A GREAT Medical WORK on MANHOOD.

Nervous and Physical Debility, Premature Decline in man. A book for every man, young, middle aged and old. It contains 125 prescriptions for all acute and chronic diseases, each one of which is invaluable. So found by the author, whose experience for 23 years in such has probably never before fell to the lot of any physician. 300 pages, bound in beautiful French muslin, embossed covers, full gilt, guaranteed to be a finer work in every sense—mechanical, literary and professional—than any other work sold in this country for $2,50, or the money will be refunded in every instance. Price only $1 00 by mail, postpaid. Illustrated sample 6 cents. Send now. Gold medal awarded the author by the National Medical Association, to the officers of which he refers.

The Science of Life should be read by the young for instruction, and by the afflicted for relief. It will benefit all.—*London Lancet.*

There is no member of society to whom The Science of Life will not be useful, whether youth, parent, guardian, instructor or clergyman.—*Argonaut.*

Address the Peabody Medical Institute, or Dr. W. H. Parker, No. 4 Bulfinch Street, Boston, Mass., who may be consulted on all diseases requiring skill and experience. Chronic and obstinate cases that have baffled the skill of other physicians a specialty. Such treated successfully without an instance of failure.

A cool soil is what oats delight in; and this grain may be put in on corn stubble without plowing by using the 'ACME' Pulverizing Harrow, Clod Crusher & Leveler. Its use will enable the farmer to sow oats from ten days to two weeks earlier than if he waits until the soil is dry enough to plow, and ten days saved may easily double the crop of oats or spring wheat.

See advertisement on page 100.

ON 30 DAYS' TRIAL.

THIS NEW ELASTIC TRUSS

Has a Pad different from all others, is cup shape, with Self-adjusting Ball in center, adapts itself to all positions of the body while the ball in the cup presses back the intestines just as a person does with the finger. With light pressure the Hernia is held securely day and night, and a radical cure certain. It is easy, durable and cheap. Sent by mail Circulars free. EGGLESTON TRUSS CO., Chicago, Ill.

AGENTS WANTED.

To canvass in every town for the sale of the GREGORY FINGER WEEDER, an entire new idea for a wheel hoe and finger weeder combined. It can be carried about from house to house, and sells readily. Profits to agents satisfactory. Address JAMES J. H. GREGORY, Seedsman, Marblehead, Mass.

PERSONALS.

WHEN Chauncey Depew was counsel for the Vanderbilt railroads he got $35,000 a year.

THE Duke of Athol has 17 inferior titles, the Dukes of Argyl and Hamilton 16 each, the Duke of Buccleuch and the Marquis of Bute 15 each, and the Duke of Northumberland 13.

PRINCE PAUL ESTERHAZY, with his boundless estates, Transylvanian forests, and other sources of wealth, would probably go beyond the late Wm. H. Vanderbilt by a trifle of 20 or 30 million dollars or so.

THE Misses Tilden, who are now in Washington, where they have made a very pleasant impression, are nieces of Mr. S. J. Tilden. In appearance they are strikingly alike, so much alike, in fact, that each is often taken for the other.

SENATOR RAMSEY, of Minnesota, several years ago gave his wife the choice between a lot block in Minneapolis or a nice new bonnet. Disregarding the traditions of her sex, she took the lot and recently sold it for $90,000. The present value of the hat she had in mind at the time is not known.

A DAUGHTER of Mrs. Elizabeth Cady Stanton says that when her mother and Miss Susan B. Anthony work together on their "History of Woman Suffrage" they often get into animated discussions over their subject and dip their pens into their mucilage bottles and their mucilage brushes into their ink bottles in indiscriminate excitement.

THE Earl of Airlie, who was married last week in London to Lady Mabel Gore, was formerly well known as Lord Ogilvie. His father died a few years ago at Denver, Colorado. The name of the present earl became familiar to Americans through the endeavors of an impostor to impersonate him. Lord Ogilvie was then serving in India.

THE President has received Fred Douglass's resignation of the $15,000 position of Register of Deeds for the District of Columbia. A pressure for a colored Democrat to succeed him is felt, but the Democrats of the District are confident that some white man of their number will be taken. Douglass is worth nearly $200,000 and can afford to retire.

LORD CREW must rank among the most liberal and progressive of British landlords. He is steadily increasing the number of holdings on his Cheshire estate, and decreasing the rentals. A good cottage and garden cost a laborer $22.50 a year. Plots of from two to three acres of good farm land, with excellent cottages and barns, rent for from $40 to $50 a year. Lord Crew at present has 195 tenants holding half an acre and under three acres; 144 with three and under 10 acres; 80 with 10 and under 20 acres; 31 with 20 and under 50 acres; 40 with 50 and under 100 acres; 41 with 100 and under 200 acres; and 14 only with 200 and under 500 acres.

Miscellaneous Advertising

A PROFITABLE INVESTMENT

can be made in a postal card, if it is used to send your address to Hallett & Co., Portland, Maine, who can furnish you work that you can do and live at home; few there are who cannot earn over $5 per day, and one have made over $50. Capital not required; you are started free. Either sex; all ages. All particulars free.

SEEDS, SEEDS, SEEDS

To our friends who have not already received it, we are ready to mail our New Catalogue of High Class Seeds for 1886.

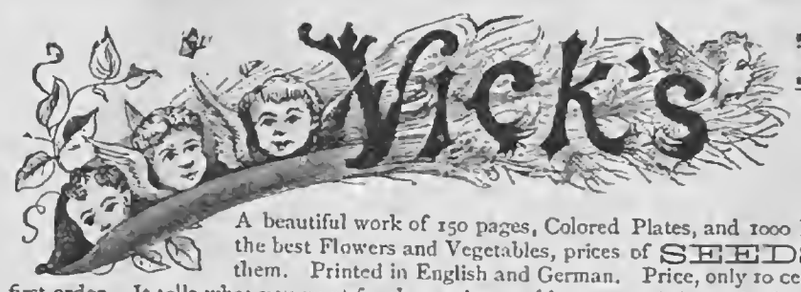
J. M. THORBURN & Co., 15 JOHN ST. NEW YORK.

BURPEE'S SEEDS,

FARM ANNUAL FOR 1886

Will be sent **FREE** to all who write for it. It is a **Handsome Book of 128 Pages,** with hundreds of new illustrations, two **Colored Plates,** and tells all about **the Best Garden, Farm** and **Flower Bulbs, Plants, Thoroughbred Stock** and **Fancy Poultry.** It is the only complete catalogue of the kind published, and describes **RARE NOVELTIES** in **VEGETABLES** and **FLOWERS,** of **real value,** which can not be obtained elsewhere. Send address on a postal to

W. ATLEE BURPEE & CO., PHILADELPHIA, PA.



Floral Guide

A beautiful work of 150 pages, Colored Plates, and 1000 Illustrations, with descriptions of the best Flowers and Vegetables, prices of SEEDS and Plants, and how to grow them. Printed in English and German. Price, only 10 cents, which may be deducted from first order. It tells what you want for the garden, and how to get it instead of running to the grocery at the last moment to buy what seeds happen to be left over, meeting with disappointment after weeks of waiting.

BUY ONLY VICK'S AT HEADQUARTERS. **SEEDS, JAMES VICK, SEEDSMAN, Rochester, N. Y.**

LOVETT'S GUIDE TO FRUIT CULTURE

J. T. LOVETT LOVETT'S GUIDE TO FRUIT CULTURE 1886 LITTLE SILVER, N. J.

Is a book of **70 Pages, with illuminated cover,** embellished with **nearly 200 engravings** of **Orchard** and **Small Fruits, Nuts, &c.** Gives **honest** descriptions of **Golden Queen Raspberry, Lawson-Comet Pear,** and **over 400 varieties of other fruits,** and instructions for **planting, pruning, cultivation and management,** with **Low Prices** for Trees and Plants. Descriptive Catalogue, with colored plates, **Free;** contains $1, $2, $3 and $5 collections, and instructions for planting. JOEL HORNER & SON, Merchantville, N. J.

FAIR AND SQUARE DEALING.

Believing that if a man has dealt squarely with his fellowmen his patrons are his best advertisers, I invite all to make inquiry of the character of my seeds among over a million of Farmers, Gardeners and Planters who have used them during the past thirty years. Raising a large portion of the seed sold, (few seedsmen raise the seed they sell) I was the first seedsman in the United States to warrant (as per catalogue) their purity and freshness. My new Vegetable and Flower Seed Catalogue for 1886 will be sent **FREE** to all who write for it. Among an immense variety, my friends will find in it (and in none other) a new drumhead Cabbage, just about as early as Henderson's, but **nearly twice as large!** **James J. H. Gregory, Marblehead, Mass.**

850,000 GRAPE VINES

100 Varieties. Also Small Fruits. Quality unsurpassed. Warranted true. Very cheap. 8 sample vines mailed for 15c. Descriptive price list free. **LEWIS ROESCH,** Fredonia, N. Y.

DO YOU PLANT SEEDS?

If so, it will pay you to get **JOHNSON & STOKES' Garden and Farm Manual** (mailed free), enlarged and improved for **1886.** It contains hundreds of illustrations with descriptions and directions for culture of nearly **2,000** varieties **Best Garden, Farm and Flower Seeds,** including **Valuable Novelties and Specialties. Unparalelled Offers. Remarkable Collections.** Our Seeds were planted last year by over **Ninety Thousand Gardeners,** and are **preferred** by Market Gardeners everywhere. **NONE BETTER! NONE CHEAPER!** Address

THE STORRS & HARRISON CO., PAINESVILLE, LAKE CO., OHIO.

Humorous.

THE man who went to the country last Summer for "rest and change" says the waiters got most of his change and the landlord the rest.

GROCER: "Half a pound of tea? Which will you have, black or green?" Servant: "Shure, aythur will do. Its for an ould woman that's nearly bloind."

SOME one says: "A very rich girl may make very poor pies." The chances are that she would. A very rich girl can afford to buy er pies at a pie factory.

A GENTLEMAN said to a minister: "When do you expect to see Deacon S. again?" "Never," said the reverend gentleman solemnly. The Deacon is in heaven."

A SHREWD Louisville girl hurried things wonderfully by assuring her young man that she despised those females who continued to eat ice cream after they have married.

ALL doctors agree that to enjoy good health the mind must be kept in a cheerful condition. But no doctor can give a man points that will make him joyous when his collar don't fit.

A FLORIDA teacher in a colored Sunday-school asked her class why a man was forbidden to have two wives at the same time. A little youth replied: "Case a man can't serve two masters."

"UNCLE James," said a Boston young lady who was spending a few days in the country, "is that chicken by the gate a Brahmi "No," replied Uncle James, "he's a Leghorn." "Why, certainly, to be sure!" said the young lady. "How stupid of me! I can see the horns on his ankles."

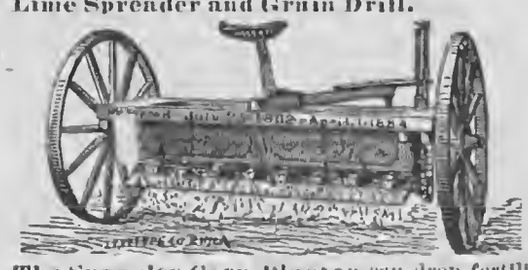
Corn Planter, Single Row and Broadcast Fertilizer Distributor, Vegetable Seeder, Lime Spreader and Grain Drill.



The Spangler Corn Planter can drop fertilizers with corn, or mix with soil before covering. The dropping of the corn is fully exposed to the operator, and can drop it in hill or drill. **The Spangler Vegetable Seeder** can sow any seed large or small, put in the fertilizer, cover and roll it, all at one operation. **The Spangler Potato Fertilizer Distributor** distributes fertilizers six inches wide in potato rows with cultivator both attached to mix with soil; shovels can be lowered or raised. **The Spangler Lime Spreader** will spread unslaved lime from 20 to 60 bushels per acre. **The Spangler Broadcast Distributor** will sow ashes, plaster and all kinds of fertilizers from 200 to 1000 pounds per acre with perfect regularity. **The Spangler Grain Drill** gives full view of the discharge of grain and fertilizer, and is made with or without seed regulator.

The merits of the **Spangler Fertilizer Feed** are attested also by their most successful use by A. B. Farquhar on his Pennsylvania Drill, Keystone Cultivator (under conditional license from J. W. Spangler which expires January 1st 1887), and on Hench's Cultivator. **Galvanized** feeds are furnished when desired. For further information send for illustrated catalogue.

WHEAT AND RYE HYBRIDS. ORIGINATED AT THE RURAL EXPERIMENT GROUNDS. TYPICAL HEADS MOST RESEMBLING WHEAT. Fig. 67. (See page 102.)

Rural Topics.

HYBRIDS BETWEEN RYE AND WHEAT ORIGINATED AT THE RURAL GROUNDS.

PROBABLY AT LEAST 50 DIFFERENT VARIETIES WILL BE THE OUTCOME.

SECOND HYBRIDIZATION BETWEEN THE HALF-BREEDS, AGAIN CROSSED WITH RYE, GIVING PLANTS BY PARENTAGE THREE-QUARTERS RYE, ONE-QUARTER WHEAT.

Experiment Grounds of the Rural New-Yorker.

THE PLANTS MOST RESEMBLING WHEAT.

As has been stated in these reports, a cross was effected between wheat and rye during the season of 1882. As among hundreds of different varieties of wheat, that known as Armstrong, but since popularized as Landreth, proved as hardy and productive as any, it was chosen as the female or mother plant. The anthers while green were removed by the aid of a pointed stick as with our wheat crossings, and the head was then bound with tissue paper, twisting it above and tying it about the stem just under the first spikelets. In a day or so the paper was removed, the palets and glumes (envelopes of the flowers) were again opened and pollen from rye flowers was dropped upon the stigma (the head of the pistil or female organ of the flower) from the point of a knife. The envelopes were closed and the tissue paper was again secured above the head. In this way the pollen was applied several times.

Ten more or less imperfect kernels formed which were planted September 22, one foot apart, nine of which germinated, passed through the Winter and matured grain the next year. Eight of the plants resembled wheat more than rye, and it is of these alone that we have to speak in this issue of the RURAL, reserving yet for a few weeks an account of those resembling rye, with illustrations of the characteristic heads. It may, however, be well to remark that we have effected two further crosses upon these wheat-rye plants, one during the season of 1884, the other last season, using again rye pollen which, by parentage, makes the plants (20 in number) three-quarters rye. Thus far they are wintering as well as any of the others.

Now in the eight original plants resembling wheat (or the female parent) more than rye, there was very little difference as to the heads. They were all somewhat bearded, all about the same shape. The plants, however, varied in vigor as well as in the size of the stems and leaves, in the number of stems to a plant and in hight. The best of these heads were selected to furnish seed which was planted September 29, one kernel each in the intersections of ten-inch squares.

The reader will, perhaps, share our surprise when he is told that the plot of about one-twentieth of an acre, presented the next season when the heads appeared, as varied an appearance as if kernels of all the most dissimilar wheats in cultivation had been sown. Our engravings, true to nature in every way, will serve to present this remarkable fact in the most forcible way.

Nos. 5, 6, 7, 8 and 9 (Fig 68, first page) are beardless and club-headed, varying a little in the number of breasts and in their position upon the stems, No. 5 being most crowded; No. 9 the least. Nos. 10 and 11 are partially bearded, and though bearing a close likeness to the female plant (Armstrong) in shape, they are much larger (as grown in this soil) and the number of kernels to the breast is greater. In several of the breasts of one or the other—we forget which—as many as *seven* kernels were counted, a not uncommon occurrence perhaps in the wheat portions of Colorado, Montana and Oregon, but never before observed in any of the hundred or more varieties grown in the impoverished soil of our test plots.

No. 1 (Fig. 67, first page,) is notable for the average length of head. No. 2 was cut from a low, feeble plant. No. 3 was also a feeble plant, but very different from No. 2. No. 4 and the horizontal head above do not differ materially from several old varieties of bearded wheat.

Some of the plants were marvels of vigor with very heavy straw of various colors—yellow, dark-brown, purplish. Some plants were exceptionally productive, as we have said, while others bore only two grains to a spikelet, and still others were half sterile. The grains themselves varied as much as the heads or plants, some being long and narrow, others short and plump.

It will probably require several years to separate these wheats so that they will resolve themselves into fixed and uniform varieties. The best heads were selected last Fall with a view to this, and they were divided into at least 30 different lots and planted as before in September, one kernel 10 inches apart either way. Looking at the plants at this time, one is struck with their dissimilar habits. Some tiller remarkably, some very little. Some grow upright, others close to and spreading over the ground.

Our next and concluding account of these hybrids will, as we have said, describe and illustrate those which most resemble rye.

In writing the above, we have kindly been permitted by the Agricultural Editor of the Weekly World to avail ourselves of a well-prepared account of these new varieties of cereals, which appeared in that journal of January 20.

THAT the Winter, thus far, has been a remarkable one, has been a subject of common remark. As additional evidence, I will state that I planted bulbs from time to time out-of-doors until the second of January, at which time the ground was free from frost, and worked as pleasantly as it does in May.

* * *

I have reason to know that some of us who write for the information of beginners are not always understood when we speak of the size of a flower pot. When, for example, we use the word inches, and say "a four-inch pot," some take the inches to mean diameter and others depth, while others again are at a loss to know which is meant. Gardeners, of course, will understand us whether we say "inches," or "pints," "quarts," etc.; but amateurs, especially that large class who are just entering the charmed circle of plant culture, many times will not. Let it be understood that when we use the word inches, we mean the diameter of the pot at the top, and many will be spared a good deal of perplexity. It seems but a small matter, but it is in small matters that we usually fail in imparting knowledge to others. It will usually be safe to assume that the novice knows too little rather than too much.

* * *

I think it was Mr. Parnell who lately spoke a good word for the Rostiezer Pear. He could scarcely say too much in praise of its quality. I esteem it as the best pear of its season. Last Fall it was difficult to get one worked on the quince; and yet I find it generally to yield abundantly as a dwarf. It is objected to it that the fruit is small and the tree a straggling grower. That shows how unreasonable some people can be. If I must choose between goodness and size, give me goodness all the time. As to the tree being a straggling grower, I remember an apposite old saw, "Handsome is that handsome does." A judicious use of the knife when the tree is young will give it a somewhat comely form. If you want a delicious early pear, plant the Rostiezer.

* * *

I am greatly pleased with "Christmas Eve" Chrysanthemum, a grand white variety of the Japanese type. At present I am inclined to think it is the best of its color, though I want to see more of it before making up my mind fully. The time has come to go slow in admitting new kinds. Seedlings are being presented in large numbers, and though some of them are very fine, and worthy of a name, the majority, I should say, from what I have seen, should be allowed to sink quietly out of sight. It is not going to be an easy thing to produce a new and distinct variety better than those we already have. I should like to see one, however, and would not, therefore, discourage the raising of seedlings, but only the indiscriminate introduction of kinds similar to, and no better than, those we already have.

* * *

The Editors ask for a good preservative for shingles, and a correspondent recommends petroleum and Virginia tar. These I know to be good. There are several forms of petroleum that may be used for the purpose with more or less success. The best, so far as my experience goes, is what is known as "finishing oil." It is about of the consistency of linseed oil, or, perhaps, a little heavier. It is applied with the common paint brush, and the shingle should receive a coat on each side to insure the best results, or it may be dipped in the oil. There is another good form of petroleum, of about the consistency of wax, which can easily be applied when melted. It penetrates every pore when it hardens, and renders the wood impervious to water. It is now often used on hard-wood floors, which can then be highly polished. Both these forms of petroleum are much cheaper than linseed oil.

* * *

Mr. Williams's description of the Alley Strawberry is about as nearly right as one could wish. It is a large and handsome berry, but very acid; too acid for me. People who are fond of sugar will find the Alley pretty good to flavor it with. I prefer a plant that will give me a happy combination of flavor and sugar in the fruit. It is so much better that way. To my apprehension, Mr. Alley has better seedlings than the one referred to.

* * *

I would suggest that the Gem Tomato be omitted from seed catalogues hereafter. It has been there too long already. [That is true.—EDS.] It is not a gem, and there seems to be no further use for it.

* * *

Two years ago I budded a large lemon on a seedling stock three years old. At the same time I made cuttings of three pieces left over. The buds took handsomely and the cuttings are growing finely. From which shall I get fruit first?

* * *

The figures of Forsythia, in a late number of the RURAL, remind me that some two or three years ago I saw Forsythia viridissima growing on a rather steep hillside, and it struck me at the time that I had never before seen it growing on a spot so admirably adapted to its habit of growth. It was in flower at the time, and very beautiful. I will add that it was growing as Nature intended it should grow, and not in the wretched moped-headed style all too common in our parks and gardens.

* * *

Mr. Falconer does not seem to like the turnip-rooted celery overmuch. I can not say that I think much of it myself, when eaten in a plain way; but when stewed and eaten as a salad, if only simply dressed with oil and vinegar, it is very nice. Try it this way, Mr. Falconer, and give it another chance.

* * *

Porous vases are a comparatively new introduction here. A potter, with his wheel, was one of the interesting features at the late fair of the American Institute. He made a good many of these vases for the edification of the boys and girls, large and small, and got orders for more than he made. They are made in various forms, classical and otherwise. They are filled with water, which very soon permeates them. The outside is then thickly covered with grass seed, which soon vegetates in a warm room, and you have a pretty object for the mantel, the center-table, or other suitable place. Different forms are made for growing ferns, which would seem to answer the purpose very well for some kinds, though I have not given them a trial. The price is an "unknown quantity" to me.

* * *

To see the Japanese village now on exhibition in New York is the next thing to visiting Japan. I can not remember ever having seen an exhibition so instructive and interesting. The Japs are working at their trades and professions just as they do at home. The work of these remarkable people, especially their painting and inlaying on vases, etc., is exquisitely beautiful. They do some things upside down, a good deal better than we do them right side up. As the village passes through the country the readers of the RURAL should by all means go to see it. Be sure to take the children. HORTICOLA.

The Apiarian.

SIXTEENTH SESSION OF THE NORTH AMERICAN BEE-KEEPERS' ASSOCIATION.

(RURAL SPECIAL REPORT).

Continued from page 25.

Bee-keepers' applicances; foundation; bee-keeping as a business; successes and failures; the Government and bee-keeping; advantages of reversible frames; the "pollen theory"; wintering bees; cellar wintering; some statistics; races of bees; conclusion.

MR. A. I. ROOT, in his paper "Cheapness or Excellence—Which?" advised buying the cheaper articles till experience showed that expensive implements were needed, and then buy carefully. Always make the bees pay in advance. Mrs. Harrison of Illinois, said she used simply loose bags tied over the hands to prevent stings. She did not like rubber, preferring linen. Dr. Mason found rubber gloves with finger ends cut off answered well. W. F. Clark used linen, with Canton flannel. Prof. Cook said the short hairs on the hands and fuzzy clothing induced stinging; the hairs should be burned off, and the fuzzy clothes avoided. Most present used no gloves and needed none. He said the idea that some were very apt to be stung while others were not, was due largely to nervousness. With his many students, he saw little to support the view that bees had favorites. Mr. Heddon thought the same. Mr. Doolittle had seen people who could, with perfect safety, go about any bees unprotected.

Mr. Vandervort spoke of comb foundation. He would use six feet to the pound for brood combs, and no wire. For sections he would use 12 feet to the pound. The wax should be soft and the foundation fresh. Old foundation, however, could be warmed, when it would be acceptable to the bees. Mr. Jones used seven feet to the pound, and found it best in the sections. It saved time, and, if crowded, the bees would thin it out well. Messrs. Pierce and Barber, of New York, thought the same. Mr. Boardman used thin foundation for sections. Mr. Dadant wished five feet to the pound in the brood chamber, and 11 feet to the pound in sections. He said that foundation in the center of the cluster would warm it and the bees would work on it at once. Dr. Mason warmed old foundation or dipped it into warm water. Mr. Manum had used foundation successfully in the same way even when ten years old.

Dr. C. C. Miller discussed the bee business. He had not found it as profitable as other kinds of business, but it kept him at home, out-of-doors, and gave him health. So though he had two years of comparative failure, he was not yet ready to abandon the business. This year his entire crop would be less than 1,000 pounds. Mr. S. D. Pettit, Ontario, said 75 per cent. of bees in Ontario died last Winter—cause, cold and inexperience. He thought the honey produced in Ontario the last 10 years had cost 25 cents per pound; the causes were unripe honey, adulteration by dealers and inexperience. Our journals show the bright side too often, and the failures too seldom. Mr. Root said Mr. Miller left a $3,000 position to go into bee-keeping. He could return to the old business at any time; but he preferred good health even with less money. And who wouldn't? Mr. Emigh, Ontario, said he had never lost his bees. In the Fall of 1884 he had 170 colonies; in the Spring of 1885, 168. He had secured 6,000 pounds of comb honey and 500 pounds of extracted. He sold 70 colonies in the Spring, and has 170 good colonies now. He was satisfied with the bee keeping and thought any one would be, who learned his business, and gave it attention. Prof. McLean, of the Department of Agriculture, said the Government now for the first time recognizes this industry. He gave the result of his very elaborate experiments which show that bees do not injure sound grapes. They only take the juice from such as are ruptured. He had fertilized queens by artificial introduction of the semen from the drone into the vulva of the queen. It must be done during the orgasm of the queen. Resolutions were passed thanking the Commissioner of Agriculture for his action, and urging that bee and honey statistics be included in the monthly reports, and that analyses be made of different grades and kinds of honey.

James Heddon, of Michigan, discussing reversible frames, said these were exceedingly valuable. They secured full frames of comb, united on every side to the frame, and, by judicious manipulation, all the honey could be secured in the sections. He preferred a hive which enabled him to reverse all at once and not each frame singly. Reversing secures more honey, stronger combs and more speedy capping. It also keeps brood chambers full of brood, not honey, and prevents swarming. Dr. Whiting said that if we reverse, just before the close of harvest, cells are filled and capped much better. Mr. Heddon said that inverting prevented swarming, as it caused the bees to tear down the queen cells.

Prof. Cook spoke of the "Pollen Theory." He showed that without pollen diarrhea did not occur. That animals that hibernate and people long sick, live for long periods with no food except the stored fat of the body. Pollen for food is hard to digest and affords more refuse or waste than the carbohydrates. Bees in Winter are very quiet if they winter well, and, like hibernating animals and people in sickness, need no albuminoids in the food. We know this as they often winter as well, and many think better, on clear honey or sirup, which has no nitrogenous elements in it. As the bees retain their feces all Winter, when in health, it seems scientific and in accord with analogy, as well as sustained by experience, that they may, in some cases, winter better if all pollen is excluded from their winter rations. If the heat is kept right, however, we need pay no heed to the pollen.

Mr. Ira Barber of New York, in the most valuable paper of the meeting, discussed the wintering problem. He said, "I have wintered colonies by the hundreds now for 25 years and with no loss. Hence, I feel free to say that wintering with me is safe. In all that time, 80 per cent. have wintered perfectly. The two essentials are heat and dampness. They are not safe without the heat, and will not remain as quiet in a very dry atmosphere. The cellar is always kept from 60° to 90° F. The only ventilation is a stove pipe, which passes through the wall to the top of the cellar and passes up several feet; this keeps the room from becoming too warm. When very cold, we keep fire in the

room above. The hives are kept tight above, so that there is no upward ventilation. In the cellar they are set on caps close together, so if the bees come out of the hives, they will get back either into their own or other hives. One end of the hive is raised one inch from the bottom board. I put them in the cellar before cold weather, and am sure they have plenty of good honey. Pay no regard to pollen. I think this an easy, cheap and safe way to winter. Last Winter I lost only three colonies out of 200. When my cellar was dry, I used to lose about three bushels of bees to 100 colonies in Winter; now I do not lose one bushel. Placing the hives close also saves bees. Mr. Hall of Canada has had no losses in wintering. He could indorse all Mr. Barber had said. He wished temperature 52° and upward. Mr. Emigh always wintered safely. His cellar was dry; temperature 45° to 48°. Mr. Dadant liked dry atmosphere. He had had no serious losses.

Mr. Barber said if the cellar was dry a temperature of 45 to 48 degrees was best, but it must not go above 50 degrees. When damp, it might rise safely to 50 or 70 degrees, or even higher. Mr. Hall said his bees bred late in Winter, so that when he set hives out May 1st, they would have three frames of brood, and by the 24th of May seven full L. frames of brood. Mr. Hedden said there was no conflict between him and Mr. Barber. In such a cellar as Mr. Barber's pollen did no harm Mr. Barber said the temperature got higher towards Spring; 45 to 50 degress may be high enough. His cellar was 22 by 28 feet, and he put200 colonies in it.

used no artificial heat, but the cellar is all under ground. His combs were somewhat moldy, but that did no harm. He cooled his cellar down with ice when he wished to carry bees out.

The number of colonies reported by the members was 4,283 in Spring, and 7,479 in October—increase 75 per cent: of comb honey there had been 155,354 pounds, and of extracted 86,928 pounds—total 242,282 pounds; wax 2,233 pounds; comb honey unsold 43,275 pounds; extracted unsold 33,425 pounds. The Convention, thus it seemed, was practically, at least, for comb honey.

Mr. D. H. Jones spoke of the races of bees. He had spent thousands of dollars importing bees. He does not like either pure Syrians or Cyprians, but does like very much a cross between these and the Italian or Carniolan. If crossed with Italian he would have one-third Italian with Carniolan, one-half Carniolan and one-half Syrian. The Carniolans had not troubled him by excessive swarming. He had found his bees, on the Islands of Georgian Bay, would mate when seven miles apart. Thus ended this large, interesting meeting. "C."

THE BEAUTIFUL POSTERS

OF THE RURAL NEW-YORKER WILL GLADLY BE MAILED WITHOUT CHARGE TO ALL WHO APPLY FOR THEM.

The Herdsman.

A YOUNG STOCKMAN'S EXPERIENCE.

ABOUT a year ago I moved into this country. My father and myself heard that the farm upon which I am located would be sold cheap. In a month's time all arrangements were made, and I was in charge of the business. It seemed to me that I was to take charge of the world, instead of a farm of 520 acres. It was my first experience in business. About the middle of March we commenced operations by grubbing and chopping. There was not a blade of tame grass on the farm. We cleared the land and sowed 25 acres of Blue Grass, 15 acres of clover and 30 acres of Timothy. These have all made good crops of hay, thus proving that the tame grasses will grow well here.

I tried my hand at plowing for the first time. The lookers-on seemed to enjoy the sight more than I did. However, I became a fair plowman before I finished. We put in 60 acres of corn and five acres of millet. Both did well, the millet yielding 2½ tons per acre.

I bought with the farm 45 head of cattle and 125 hogs. I afterwards bought a thoroughbred Short-horn bull and all the good heifers and steers I could find in the neighborhood. Before Summer I had 125 head of cattle and 240 hogs. The hogs kept in fine condition through the Summer on peaches and other fruits, for which this country is famous. When the mast commenced to fall, I turned my hogs out, and in five weeks had 80 ready for market. I fed them only 2½ bushels of corn each. My beef cattle kept in fine condition on the native grasses. In December I started for St. Louis with my cattle and hogs. We are 45 miles from a railroad. I felt proud enough when my animals were driven into the Stock Yards. The commission merchant told me I was the youngest man they had ever given checks to for stock. I looked so much like a boy that I had to identify myself. I am only 21 years old.

My first year's experience has certainly been a success. I like the life. I live in a log cabin which I had boxed and ceiled and then painted. I have a library of about 175 volumes, and other conveniences that make my life very pleasant. I give my men the use of my library and encourage them to improve their spare time. On the whole, I am much pleased with farm life in this country and would not go back to city life. I. C. G.

Boone Co., Ark.

Farm Economy.

TANK FOR OILING WAGON WHEELS.

MR. J. P. SIMPSON, of Palmer, Illinois, describes his method of oiling wagon wheels, which is illustrated at Fig. 70. B. represents

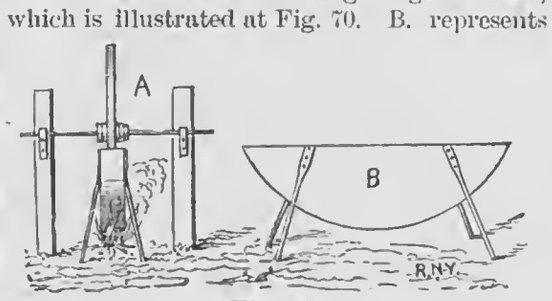

Fig. 70.

iron tank, in which the linseed oil is boiled. It is to be placed between the posts shown at A. When the oil begins to boil the wheel is placed in the tank, supported by means of a stick which rests on cleats attached to the posts. The wheel is turned slowly around and well rubbed with a small paint brush. To accommodate different sizes of wheels several sizes of cleats are placed on the posts, or the tank can be raised or lowered by using bricks. The tank should never be more than half full, or it will boil over. The advantages to be derived from carefully oiling wagon wheels are too obvious to require mention. The cost of such a tank as this will be easily saved in decreased blacksmith's bills.

YANKEE SCOOT.

MR. J. A. PUTNAM sends us the design shown at Fig. 72. He finds it very useful in

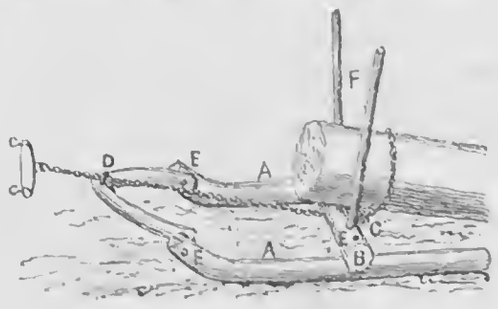

Fig. 72.

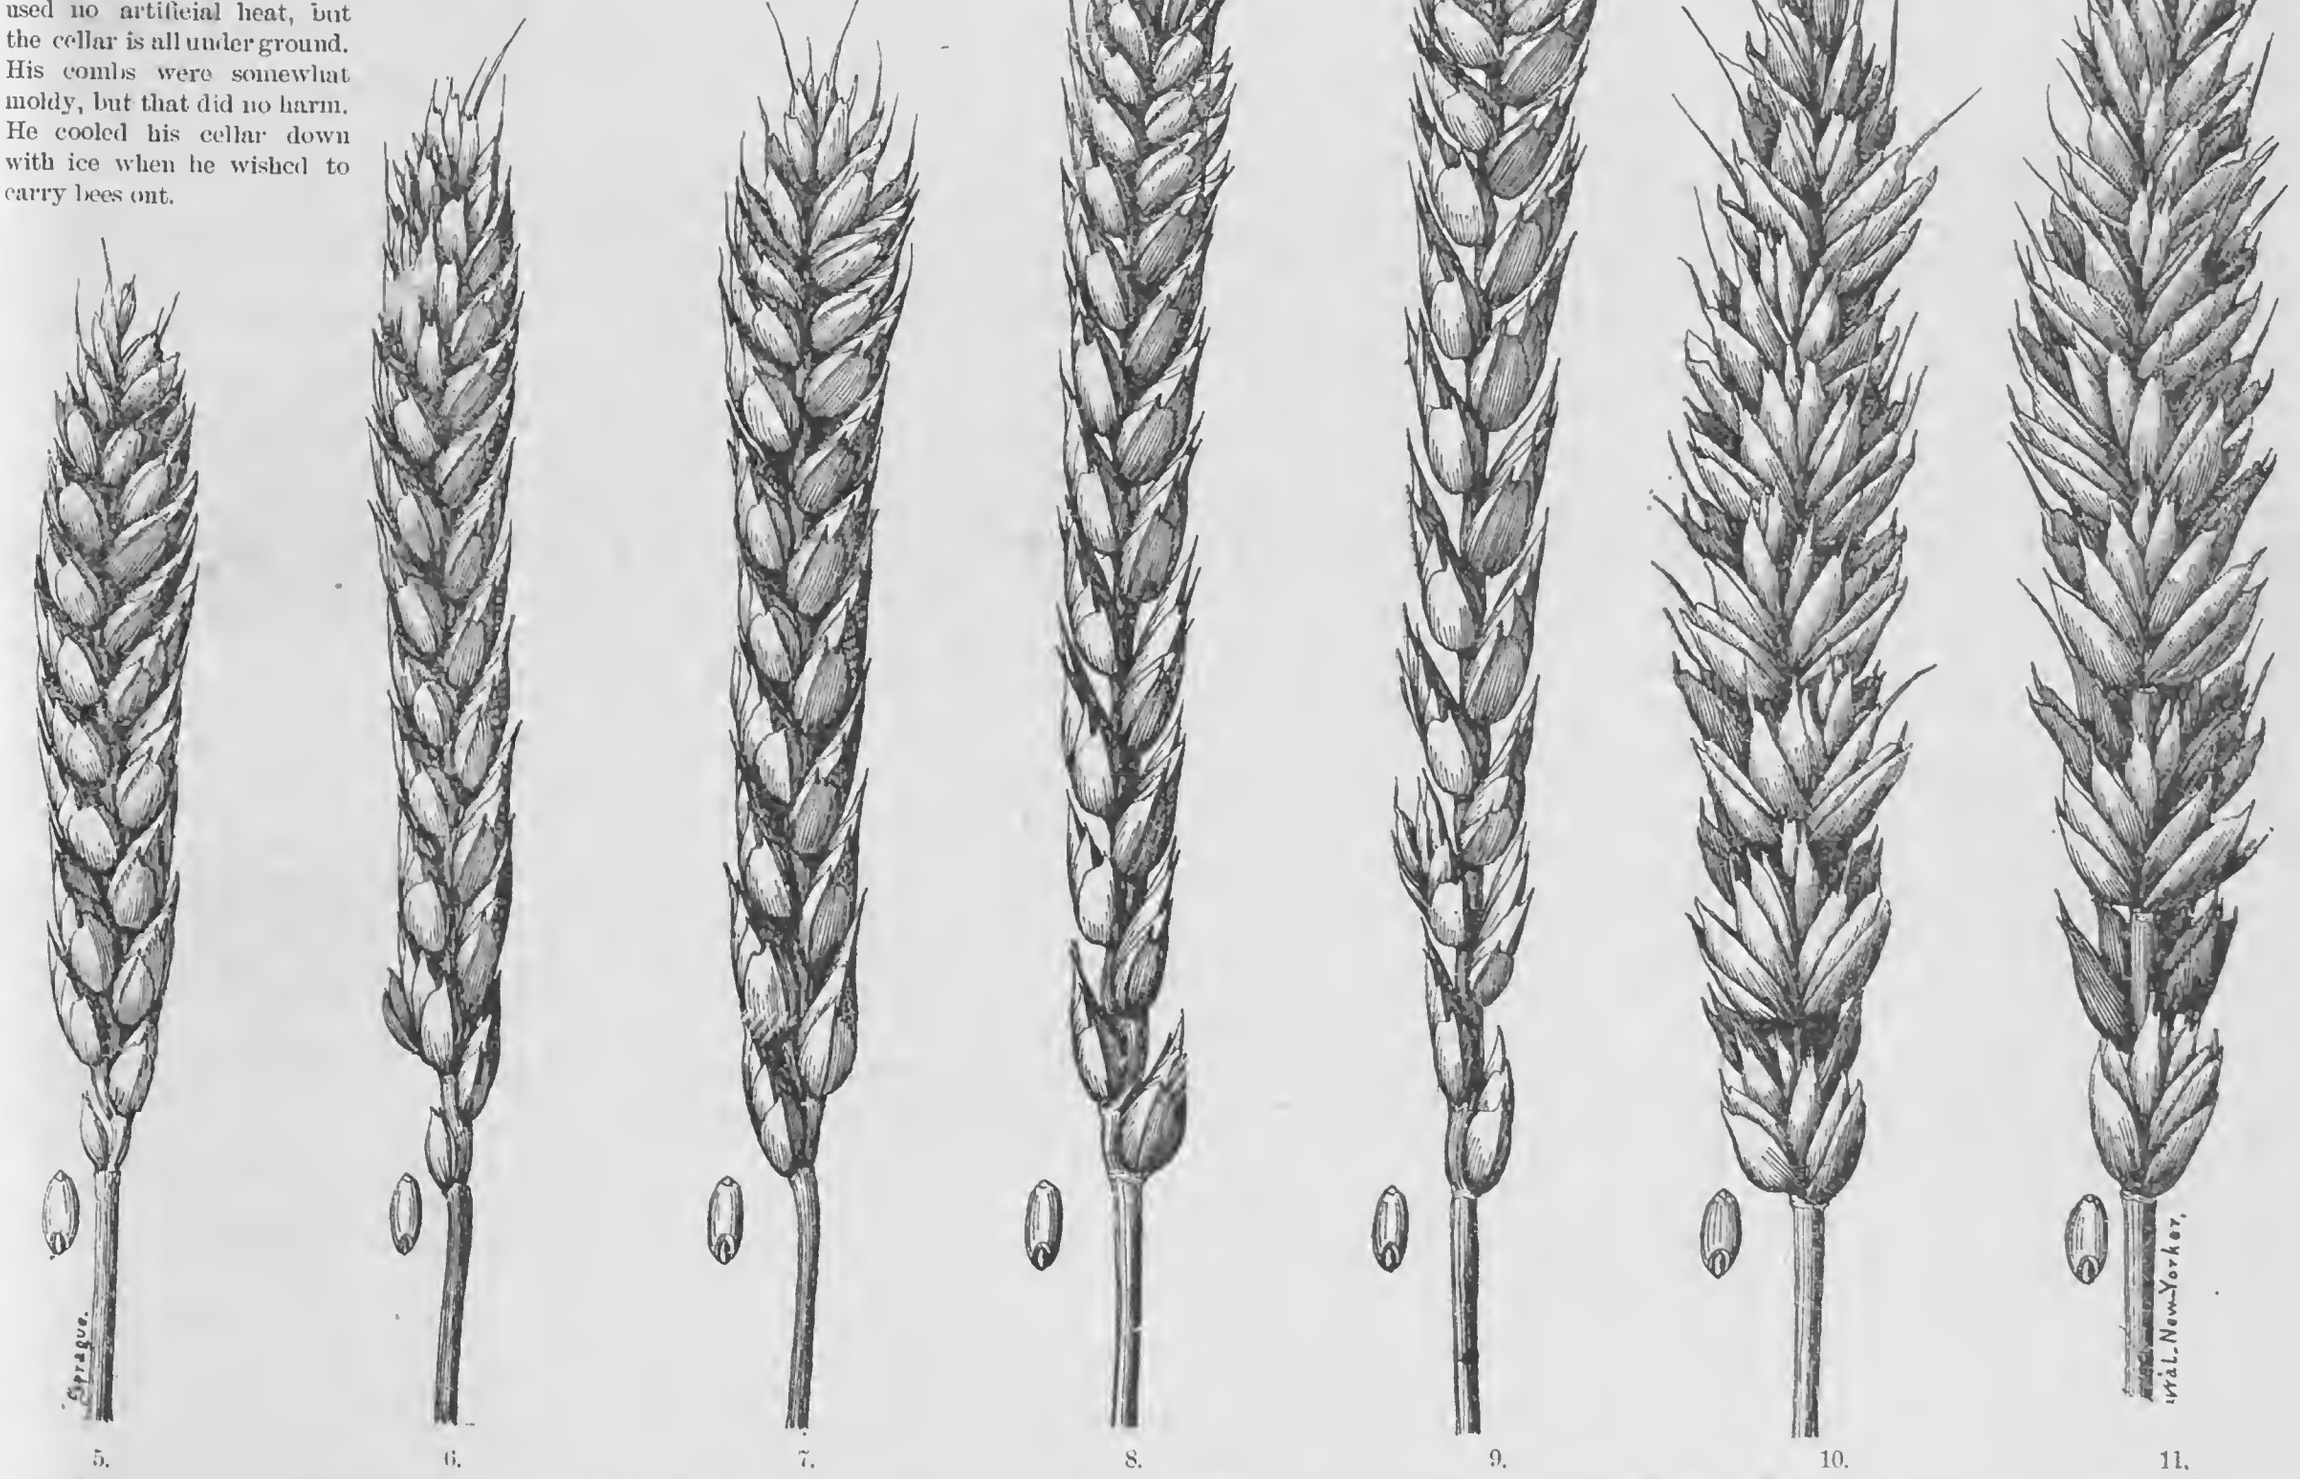
hauling brush, logs or poles. It makes a light substitute for a sled, and will keep in the road like a long-tongue sled. It will "scoot" over a log without catching. The horse pulls from the load and not from the scoot. It is easily made, as it contains but four pieces of wood and four iron bolts. The runners A. A. are 3½ feet long and four inches thick. The beam B. is 3½ feet long and five inches thick. C. is a staple to hold the chains to the center of beam. The bolts holding the runners to the tongue are eyed at E. E. The crotched tongued D. is made from the forked limb of a tree about three inches thick, or it can be made of two crooked pieces of wood bolted together. This is the strongest part of the whole sled, and, like the beam and runners, should be made of natural timber with only the bark shaved off. A ring or staple is placed under the point of the tongue to admit the passage of the chain hook. In loading the "scoot," the load is placed on the beam. Then the chain is hooked into the staple, passed over the load, back through the staple, under the beam and out through the ring or staple on the tongue.

A HOME MADE BENCH VISE.

A GOOD iron vise is a very useful tool, but it costs so much that many farmers do not feel

The Enterprise Meat-Chopper.

Every family should have one. Size No. 10 will thoroughly cut one pound in a minute. The meat is chopped—not mashed. The machine is simple and durable. The price is $3.00, and we give it for three subscribers. The RURAL sells nothing except the R. N.-Y. The No. 22 cuts two pounds per minute. Price $4.00. Given for four subscribers. This is the size you should have. Address the Enterprise M'f'g Co., cor. 3rd and Dauphin Streets, Philadelphia, Pa., for circulars.



5. 6. 7. 8. 9. 10. 11.

WHEAT AND RYE HYBRIDS. ORIGINATED AT THE RURAL EXPERIMENT GROUNDS. TYPICAL HEADS MOST RESEMBLING WHEAT. Fig. 68. (See page 102.)

that they can afford it. A wood screw vise is not very expensive, but for many purposes it is quite unsatisfactory, as the strength of the threads is quite limited. The device illustrated in Fig. 64 may be made by any one who has a saw, augur, mallet, chisel, and plane, and a little knowledge in their use. It may be constructed in an hour or two, and is stronger than the average wood screw vise. The power is exerted by means of a cam roller; a strong iron bolt passes through the roller lengthwise, but not quite at its center. The hole should be bored about five-eighths or three-quarters of an inch to one side of the center, and sufficiently large so that the bolt will slide in and out readily. It is evident that if the handle which passes through the roller be moved about so that it points downward instead of upward, the roller will be moved half way around, and the thicker side will be between the bolt and the movable jaw of the vise. As the handle has a long sweep as compared to the distance the jaw is moved, a very considerable power is exerted. The jaws are made to accommodate themselves to different thicknesses, by putting the bolt through different holes in the arm. The latter has a mate at the other end of the roller, not shown in the drawing. These arms pass through the side boards of the workbench, and the inner ends are also made adjustable by another series of holes. Thus the vise will accommodate almost any desired thickness. The roller should be about five inches in diameter, and of some firm wood that does not split readily. A section of the limb of an apple tree, or a round stick of cord wood of the proper size, will answer the purpose.

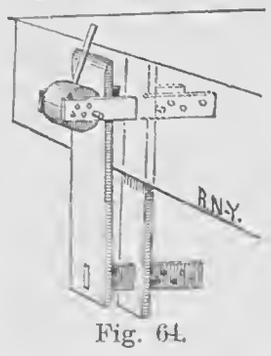


Fig. 64.

E. S. G.

SAWING MACHINE.

THE machine shown at Fig. 69 is in use by Mr. Geo. E. Sage, of Harpersfield, Ohio. A A are boards of light material; length, five feet; width, four inches; thickness, five-eights of an inch. B is a block of thick wood, one foot

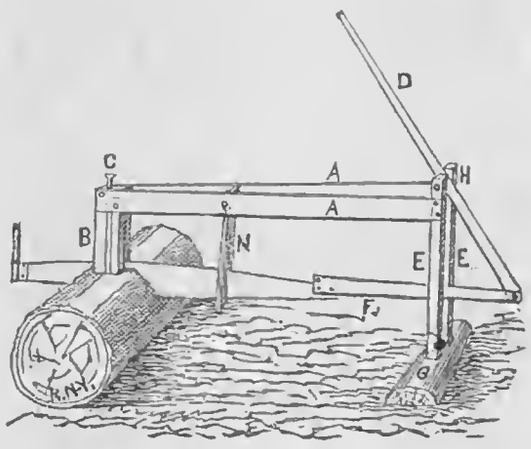

Fig. 69.

long, four inches square, with a slot eight inches long for the saw to play in, from the bottom up. Four inches from the top of block B, saw in five-eighths of an inch, and split out to admit the boards A A, and bolt on, as shown in the figure, with two one-fourth-inch bolts four inches long. Then one-half inch from the outside of block B bore a five-eighth-inch hole lengthwise of the block B between the two bolts. E E are sticks of ash 30 inches long and two inches square, placed four inches apart. Four inches from the top, they are cut in five-eighths of an inch, to admit the boards A A, which are securely bolted on. At the bottom of E E, a piece of light wood two feet long, rounded on the upper side, is placed for a foot rest. Two inches from the top of E E is bored a three-eighth inch hole to admit a bolt (H) 8½ inches long. On this bolt is to be strung a small piece of wood one inch thick, then an iron washer, then the handle (D, 44 inches long) hung in the center of the stick; another washer and another block of wood, D being a round stick two inches in diameter, flattened on each side to five-eight inch in thickness at one end. F is a tapering stick 4x1½ inches at one end, two inches square at the other, in which is an open mortise five inches long and five-eighths of an inch wide, to admit the handle D. Lengthwise of the wide end, saw in four inches to admit the saw-plate. Fasten together with two screws. Then through the stick, just above the saw, place either a large screw or a small bolt, to stiffen the stock and save the strain on the two screws fastening the saw-plate on. Through the hole in the block B, put a five-eighth inch rod 14 inches long, wedged-shaped at the lower end, with a hardened top end, to be driven into the log. If the saw is limber, it may be necessary to put on a board 22 inches long, with a slot 18 inches for the saw to play in, hung on a rod for the board to play in, as shown in the cut by N.

Pomological.

OLD FRUITS UNDER NEW NAMES.

C. M. HOVEY.

Objectionable and reasonable changes of variety; names of fruits; examples.

I HAVE noticed with much surprise that in the recent exhibitions of fruits of the Massachusetts Horticultural Society, our old and well-known pears have been shown under entirely new names. For instance, that fine pear, the Doyenné du Comice (the Doyenné of the Committee), is called the "Commice;" the Duchess d'Angoulême, the "Duchess," and there were similar changes all round. Boston is celebrated for its notions, and many of them I believe to be mighty good ones—some are indifferent—and occasionally some of them are bad.

Regarding this new notion, I had intended to notice it before. Our good and worthy President, in his address at the late meeting of the American Pomological Society, at Grand Rapids, made some suggestions as to the ridiculousness of some of the names given to fruits by the old cultivators, and the really nonsensical, meaningless and often uncouth and foolish ones of more recent fruit growers, such, for instance, as Big Bob, Old John Brown and Wizard of the North, Strawberries; Iron-Clad and Wild Goose Plums; Rancocas Raspberry; Wilson Junior Blackberry; Upper Crust Pear, etc. Here, indeed, his suggestions were very timely and valuable, and I hope important enough to prevent the further application of such absurd titles to good fruit. But I did not suppose he intended, now in his ripe old age, to alter old names and undo what he has for many years, as President of the American Pomological Society, devoted time and thought to accomplish—the improvement of the nomenclature of our fruits—and aided, so energetically, in detecting synonyms with which our catalogues were so full some few years ago, and which only perplexed and worried every one interested in fruit culture.

But now, after all the labor performed by the committee especially appointed to revise the names of fruits, and systematize and publish them in the Transactions of the American Pomological Society, the work has to be gone over again. Those who looked upon the Society's Report as some authority for names, now find they have to begin anew. That favorite old pear, which the late A. J. Downing thought identical with Beurré Bosc, the Paradise D'Automne, is now only the "Paradise;" the Hovey's Seedling Strawberry is only the "Hovey," and so on, depriving the enthusiastic cultivator of the honor of producing perhaps the best fruit of its kind. Anybody can raise a Hovey Strawberry, if he so chooses to call it, but anybody cannot raise Hovey's Seedling. Sir Thomas Andrew Knight raised a cherry which he called Knight's Early Black, because there was an old Early Black, and he was ambitious (modest as he always was) to have his name connected with it; it is now "Early Black;" and, as regards that superlative pear before referred to, the Doyenné du Comice, how ridiculous to write "Commice;" the pear having been christened by a committee of the Horticultural Society of Angers, France, who first decided upon its merits, the "Doyenné of the Committee," being in form, smoothness and beauty of skin, fineness of flesh and deliciousness of flavor, similar to the old and well known White Doyenné, in its palmy days, the type of all the numerous Doyennés that have since been produced. "Commice" is a word unknown in any language and more ridiculous and unmeaning than even Big Bob, and the name is a blot upon the reputation of the Society, through its committee.

(To be concluded next week.)

Farm Topics.

MARKET THOUGHTS.

How is the apple market? Farmers who have been holding their fruit for better prices are anxiously asking the question. The market has shown little signs of improvement thus far. The prices for the past six years are given below. The figures given are the prices quoted for best Greenings on the first of each month.

	Jan.	Feb.	March.	April.
1885	$2.25	$3.25	$3.00	$3.25
1884	4.00	5.50	3.75	4.00
1883	3.75	4.00	4.50	5.00
1882	3.75	3.50	3.75	3.75
1881	1.75	1.62	1.50	1.37
1880	2.50	2.75	3.50	3.50

The quotations for February 1, 1886, were $2.25 for best Greenings, with Baldwins 25 cents cheaper. Towards the end of the season red apples sell the best. After March Baldwins are always quoted at 25 to 50 cents higher. Immense quantities of apples were shipped abroad last season. The prices realized were not satisfactory; oftentimes the charges for freight and storage consumed all the profits. The great apple crop of last year clearly showed that in such times of plenty careful packing and sorting must be relied upon to bring out the best prices. In such times the best specimens always find the first sale, while the inferior lots can hardly be given away. With low prices, ordinary customers can afford to be fastidious, and they enjoy their brief moment of authority to the utmost.

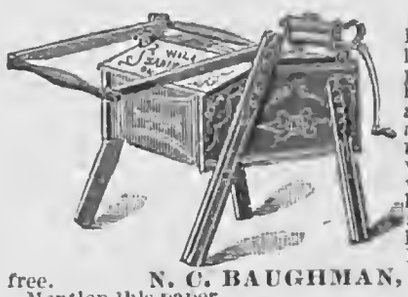
The low prices for apples here seriously affects the trade in dried fruits. Dried apples are from one-and-one-half cent to two cents cheaper per pound than in previous years, and other dried fruits are correspondingly lower. If farmers have reason to regret this state of affairs, city people have every reason to be grateful. Thousands of people are enjoying an abundance of fruit this year, that hardly knew what it meant before. Apple sauce and apple puddings hold an honorable place on many a boarding-house table, that had previously been guiltless of such healthful fare. One hears little of the dried apple pies and sauces so common upon the tables of the poor in years of high prices. Many city housekeepers bought their supply of apples and vegetables directly from some friend or relative in the country. This practice appears to be growing in favor. It would doubtless interfere seriously with the business of the produce merchant, if good storage could be secured. It would be greatly to the advantage of the farmer if city houses could be built with some better system of storage, where a Winter's supply of vegetables and fruit could be kept in fair condition.

The retail fruit trade in this city is enormous. It is estimated that over 500 barrels of apples are sold every pleasant day from the fruit stands alone. Add to this the great quantities of bananas and oranges disposed of, and we see how much of the health of the city depends upon these humble places of business. Everybody patronizes them from the newsboy to the Wall St. banker. The average New Yorker is always in a hurry. These little stands, where he can buy and eat his fruit almost without stopping, suit him exactly. If they were abolished he would not eat half so much. Red, medium-sized apples find the best sale, for eating purposes, in this market. People distrust a very large apple or a very small one. The first they consider too apt to be coarse and tasteless, and the other is too small for a fair bite. The sharpest dealers select a medium-sized, strongly acid apple, and thus retain their regular customers. A barrel of apples sold on one of these stands brings about $12. The retail prices seldom vary from year to year, regardless of the wholesale price. Apples are always about the same size, and the prices seem to be fixed at one cent apiece, two for five cents, or three for five cents, according to size. No wonder some of these dealers grow rich at the business.

Miscellaneous Advertising.

A Double Gang "ACME" Pulverizing Harrow, Clod Crusher and Leveler will be sent to any responsible farmer in the United States, and if it does not suit he may send it back at the expense of the manufacturers. No pay is asked until tried on the farm. Farmers should not, therefore, let dealers palm off on them a base imitation or some inferior tool under the assurance that it is better.

See advertisement on page 114.



BECKER'S Patent Washing Machine Improved. The best, cheapest, and most desirable washer made. Easily worked, and washes perfectly clean. Descriptive Circulars and Price Lists mailed free. N. C. BAUGHMAN, York, Pa.

Arboricultural.

THE FORSYTHIAS.

YOUR notes on the Forsythea viridissima are very acceptable, and a just estimate of this pretty Golden Bell. But you are slightly in error in saying it was "introduced by Mr. Forsythe from China in 1845." If my recollection serves me, it was sent home among the other treasures gathered by Mr. Fortune on his memorable excursion to China, under the auspices of the Royal Horticultural Society of London. His explorations were then made about Shanghae. On his return in 1861, he went as far as Pekin, several hundred miles north of Canton, and here he found that most beautiful and desirable of all, F. suspensa, much hardier than F. viridissima, a much better grower and with a habit that can be made into a shrub or low weeping tree, trailing its slender, whip-cord branches to the ground, forming a drooping head more dense and graceful than a Kilmarnock Willow, and one made of golden blossoms as early as the earliest peach bud opens. This superb species you do not name. I have trees 10 feet high which are distinguishable 100 yards away, so conspicuous is their profusion of flowers. Besides, its slender shoots, the larger branches have a light yellow bark, as distinct as the Red Cornus: altogether it is one of the finest shrubs introduced by Mr. Fortune. F. viridissima often gets killed nearly to the ground in extremely cold Winters, while I never saw the smallest shoot injured on F. suspensa.

And this reminds me to say a few words in regard to the services of such men as Fortune, Von Siebold our own Dr. Hall, and others who brought us the rich treasures of almost unknown climes. We commemorate in some way eminent men, statesmen, poets and merchants. We fill columns with obituaries of millionaires and their charities, which never began to assume the relative proportions of the poor man's. We regale ourselves with the juicy pears, the delicious grapes and the luscious peaches as if they were Nature's productions, without ever a thought of such men as Van Mons, Knight, Dana or Bull, who produced them, or of their long, patient and laborious efforts to the end attained. The owner of every country home throughout the land ornaments his grounds with beautiful trees and shrubs—the Weigela, the Forsythia, the spiræas, the exochorda, the hydrangea, the Japan Viburnum and many others, as if they too sprang up spontaneously in the nurseryman's grounds, with no idea that any such men as Fortune, Van Siebold or Dr Hall ever lived. The erection of a statue is commendable and valuable, both for its commemoration of the man, and as a work of art; but how shall we estimate the introduction of those things which are the adornment of every country home, greeting us anew every Spring with their verdure and bloom, and are ever a perpetual source of pleasure and delight.

C. M. HOVEY.

What Others Say.

THE RURAL WHEAT-RYE HYBRIDS.—Our friend, the Farmers' Review, says: It is claimed that experiments in England to hybridize wheat and rye have proved successful, resulting in a berry closely resembling wheat, grown on a stalk of rye. The new grain has not yet been produced in sufficient quantity to test its quality for bread. The object aimed at is to obtain a good bread, making grain on a straw more hardy than wheat. Rye does not suffer from winter-killing as wheat does, and will succeed fairly well on soils too poor and thin for wheat. What the name of the grain will be is not yet made public. Perhaps it will be Ryeat. The RURAL NEW-YORKER, two or three years ago, was working at the same experiments in hybridizing the two cereals in its Experiment Grounds, and, if our recollection serves us right, reported partial success. Has it allowed the English to get ahead of it in achieving complete success?"

We think not. The report above referred to, no doubt, arises from the fact that an article in the Century Magazine gives a description of our rye-wheat hybridizations, without mentioning that the work was performed by the RURAL or indeed in this country. The "completeness" of our success may be seen at the Rural Grounds, where 40 little plots are devoted to fixing the varieties produced by the original hybridization, not to speak of the three-quarter-rye hybrids which were effected last year.

THE "HAY SPICE," so frequently advertised in English agricultural papers as a condiment and a means of rendering even damaged fodder palatable, appears to have for its chief constituent sugar or molasses. It is well known that a "sweet tooth" can be cultivated in cattle to such an extent that they can be induced to eat large quantities of straw or coarse fodder that has been sprinkled with sugar. Sugar feeding is said to be employed with profit in some portions of England, two quarts of molasses being considered a fair daily ration for a fattening steer. Waste sugar has even been used in preserving newly cut hay in what is known as the silage stack. It seems generally admitted that the practice of throwing a quantity of salt into the silo is needless if not unprofitable. It may be that waste sugar used in this way would give better results. Here is a chance for some of our experimental farmers to determine this point, which we think has not yet been tested.

PRIZE ENSILAGE.—The English Ensilage Society recently offered prizes for the best specimens of silage. There were 260 entries made, which were divided into eight classes. There were 79 entries in the class for Meadow Grass. The first prize was won with a sample of aftermath preserved in a silage stack. This same sample subsequently won the champion prize for best specimen in the show. The class for corn silage was the smallest of any in the show, there being but nine entries. The principal crops used for silage in England appear to be the grasses, clovers, beans and grains. It is simply uncured hay and hardly to be compared with our chopped corn-stalks.

THE LATEST AND BRIEFEST.

THE Burke Peach is advertised by a Louisiana nurseryman, with whom it originated, as "the largest and best peach in the world."....

WEBB & SON, of Wordsley, Stourbridge, England, announce a new beardless barley. The beards drop off as the heads ripen.....

MR. E. P. ROE, for the third year sends us (January 20) specimens of his Highland Beauty Apple, all well preserved and of fine quality. It is like the Lady Apple (Pomme d 'api), but larger and of better quality.....

DR. F. L. OSWALD remarks, in his book of Household Remedies, that drugs can rarely do more than change the form of disease or postpone its crisis. The best way to "assist" Nature is to give her fair play by forbearing to meddle with her restorative methods and by removing the predisposing cause of the disorder.....

A FLORAL novelty to be sent out next Spring is a semi-double Phlox Drummondii..

IT is a pity, as the London Garden states, that "semi-double" should be to many rose growers a term of reproach.....

THE Michigan Farmer is authority for the statement that a Grand Rapids merchant bought 27,000 eggs at an average price of 10 cents per dozen last Summer. He has just sold them for 18¾ cents, and is so encouraged that he will build a cold-storage house next season and largely increase his business.....

T. T. LYON advises, in the Michigan Farmer, that we always buy and plant peach trees one year old from the bud. Cut back all side branches to one bud each. From two to three feet of clear trunk are far better than more. If a few branches outgrow the others, nip off the tips so that the other branches may overtake them.....

MR. J. J. H. GREGORY says that lots of cabbages are raised about Marblehead (Mass). But they can't raise them oftener than once in four years. He tried using wood ashes this year on cabbages where they had been raised the year before. He used 100 bushels of unleached ashes and had raised as thrifty a lot of cabbage as he ever raised. The ashes ought not to cost over $45, which he calls cheap manuring for an acre.....

WHEN the RURAL first tried the Wyandottes and praised the breed, some of our friends spoke as if, in our inexperience, we praised them merely because the breed was new. It was much the same when we reported our success with the Plymouth Rocks. Well, others are praising them now—praising them far beyond their merits. There are good strains of Wyandottes and poor strains.....

IT is said that the new rose, "Her Majesty," is by far the largest rose ever introduced.....

ACCORDING to the N. Y. Times, the cost to the State for graduating a student at the New Hampshire Agricultural College is, $6,000....

AT a late meeting of the Massachusetts Horticultural Society, the Frederick Clapp Pear was spoken of as of superior quality, a good grower and bearer. Our readers must not forget the RURAL'S estimate of this fine pear.....

SEC. CHAMBERLAIN says, in the Ohio Farmer, that the buyer has a right to know that he gets just what he pays for; the exact substance and nothing else, the exact amount and nothing else. Therefore the seller must not substitute oleomargarine for butter.....

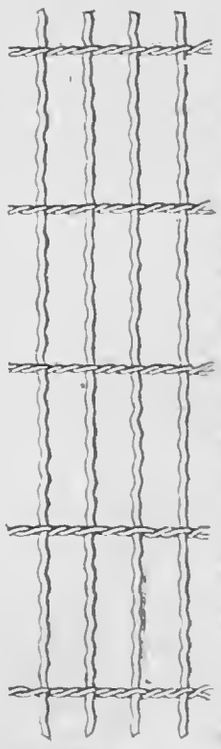
SAW SET

This set has given perfect satisfaction; is **durable, effective** and **cheap**, weighs less than 4 ozs., and is adapted to all varieties of cross-cut saws. Any man can perfectly set a saw in 3 mins. Also **CHAMPION GUAGE** for dressing raker teeth; warranted. Sample of each by mail on receipt of $1.00. Send for circular and prices to J. E. WHITING, MONTROSE, Pa.

38TH ANNUAL REPORT OF THE PENN MUTUAL LIFE INS. CO. OF PHILADELPHIA, PA., shows stability, steady growth, thrifty management, and low cost. Of interest to those seeking the **BEST** forms of life insurance. Get it and other publications of agents in all cities and large towns, or write to the Home Office, Phila.



PATENT CORRUGATED WIRE FABRIC,

Suitable for Fencing in many locations, and for Railings, Window Guards, Tree Guards, and other purposes.

It consists of vertical pickets or bars, made of corrugated galvanized steel rods, oval in section, secured by horizontal cables, each composed of two strands of galvanized steel wire.

As a fence it is cheap, strong, durable, and easily erected; it is as effective as a barbed fence in turning cattle, and there is no risk of injuring either the animal or the fence; it requires no longitudinal rail to support it, as it carries itself from post to post as well as a plain wire or barbed wire fence; it can be seen as plainly as a regular picket fence; it can readily be taken down, rolled up and moved from place to place.

TRENTON IRON CO.,

THE LINE SELECTED BY THE U. S. GOV'T TO CARRY THE FAST MAIL.

Burlington Route

C.B.&Q.R.R.

It is the only line with its own track from

CHICAGO TO DENVER,

Either by way of Omaha, Pacific Junc., St. Joseph, Atchison or Kansas City.

It connects in Union Depots with through trains from NEW YORK, PHILADELPHIA, BOSTON and all Eastern points. It is the principal line to SAN FRANCISCO, PORTLAND & CITY OF MEXICO

It traverses all of the six great States of ILLINOIS, IOWA, MISSOURI, NEBRASKA, KANSAS, COLORADO with branch lines to all their important cities and towns.

From CHICAGO, PEORIA or ST. LOUIS, it runs every day in the year from one to three elegantly equipped through trains over its own tracks between

Chicago and Denver,
Chicago and Omaha,
Chicago and Council Bluffs,
Chicago and St. Joseph,
Chicago and Atchison,
Chicago and Kansas City,
Chicago and Topeka,
Chicago and Cedar Rapids,
Chicago and Sioux City,
Peoria and Council Bluffs,
Peoria and Kansas City,
St. Louis and Omaha,
St. Louis and St. Paul,
Kansas City and Denver,
Kansas City and St. Paul,
Kansas City and Omaha,

For all points in Northwest, West and Southwest.

Its equipment is complete and first class in every particular, and at all important points Interlocking Switches and Signals are used, thus insuring comfort and safety.

THE LATEST AND BRIEFEST.

(*Continued from page* 105.)

MR. RAWSON, an experienced celery grower, estimates, in the Massachusetts Ploughman, the expense of growing an acre of 7,000 plants at $250—that is about four cents per plant. Blight is caused by a check in the growth, and the remedy against the check is water. Mr. Rawson's average selling price is six cents per bunch or root.....

GOOD seed and rich land for cabbages. It will soon be time to sow seeds in hot-beds for the earliest crop—the first of March for this climate. Mr. J. Harris recommends the true Early Jersey Wakefield, Henderson's Early Summer and Newark Early Flat Dutch; the first for earliest, the others for second early...

HAVE you any Moss Roses in your garden? They are quite hardy, and if there is a more delicately beautiful object than a Moss Rose bud just before the petals unfold, we don't know what it is.....

OUR friends should know that the so-called Monthly or Everblooming Roses are the only roses which bloom at intervals from June till frost. But they are not hardy without protection when the thermometer goes to zero, and sometimes perish even with the carefullest protection.....

IF hardy roses are desired, we must select from the so-called Hybrid Remontant (or Perpetuals), Mosses or Climbers. These, however, bloom but once or twice (June and Fall).....

IF we can rely upon what the new catalogues say, the Cory Sweet Corn is the earliest in cultivation. It resembles the Marblehead, but the ears are said to be somewhat larger..

THE Industry Gooseberry, though a foreign variety, promises well. We hope to be able to make a report as to its behavior next season. If it should not mildew, it would be well to raise seedlings from it.....

TRY the Arlington Celery. Try the hardy variegated grass Eulalia Japonica Zebrina. Try Silver-Hull Buckwheat, the Industry Gooseberry, the Frederick Clapp Pear, the Eaton Grape, the American Banner Oats, the All-seasons Cabbage, the Oak-leaved Lettuce, the Tomhannock Lettuce, King of the Garden Lima Bean. Send for the catalogues announced in our advertising columns.....

THE Massachusetts Horticultural Society deems the Jefferson, McLaughlin and Washington Plums the best. The new Belmont Strawberry was alluded to as most productive and, in quality, from fair to good. The Jewell was thought to be better in quality than the Belmont; while in size it compares favorably with the Sharpless, the form is better and it is a good bearer.....

PRES. WILDER recommends the Washington Strawberry Apple as next in value to the Gravenstein. The Prince of Berries is considered as high-flavored as any berry, while the Parry and Henderson are promising.....

THE American Dairyman thinks the Holland men lost caste by taking their cattle to the Fat Stock Show. The cattle received only second prizes though there were no competitors. Prize beef cows should have little offal and much meat. Prize dairy cows must have large offal. The two characteristics can hardly be combined.....

IN filling the ice-house go to a clean pond. Don't take frozen water that contains the germs of disease, sent into it by the drainage of stables or graveyards. We have seen both used. It is by no means proved that water is purified by freezing. Dr. Edson states, in the Analyst, that typhoid fever germs can retain their vitality at a temperature of 20 degrees below zero. The taking of a disease through a glass of ice water is by no means impossible. Avoid all stagnant pools either as solids or liquids.....

MANY people appear to think that air can not pass through ordinary wood and stone. This is a mistake. We have seen air blown from the lungs through wood, brick, stone and leather so strongly as to cause a flame to flicker. Rubber is almost the only substance, from which wearing apparel is ordinarily made that is entirely impervious to air. A man incased in an under-suit of rubber for any length of time would suffer seriously. Air and damp readily penetrate ordinary building materials. Stone allows from four to six cubic feet of air to pass hourly through every square foot of surface, while brick permits eight feet to pass through. A freshly made brick takes up from eight to 30 per cent. of its weight of water; and a good-sized house will often contain in the bricks of the foundation walls about 1,000 gallons.....

THE dairy cattle men are calling for a statement showing the cost of food used in fattening a steer for the Fat Stock Show. Good—let us see if a pound of this tallow costs as much as a pound of "test" butter.....

IN some parts of England the farmers and butchers are fighting each other. Last Autumn when fat stock of all kinds were plenty, and butchers had their pick, they combined to keep down the prices of live stock while the price of dressed meats remained the same. Then the farmers began to slaughter at home, selling the meat cheaper than the butchers did. Now the butchers refuse to buy of such farmers. It seems probable that in many places, farmers will combine and do their own slaughtering.....

THE Kansas Ag'l College recently lost a valued friend. The Short-horn cow Grace Young 5th died at the age of 15 years. She was bought 12 years ago for $1,080. Six of her offspring have been sold for $1,295. The college now owns a small herd of her descendents, worth several thousand dollars.....

IT seems likely that the word "yard" will be left out of the "farm manure" of the future. There is no reason why home fertilizer should be thrown into an open space to have the goodness washed out of it. It is well worth a shed.

MR. GUILFORD DUDLEY, of Kansas, fed 87 steers on an average grain ration of 18½ pounds bran and 11½ pounds shelled corn. They were fed in open lots, and made an average gain of 88 pounds in 30 days. One steer, very gentle, made a gain of 140 pounds in 30 days. The Live Stock Indicator rightly says that the nearer a fattening animal comes to being a pet, the greater the profit in feeding him.....

AT a recent English Agricultural dinner, the growing of tobacco was advocated as a means of productive labor for English farmers. The Mark Lane Express thinks there is enough of the "weed" now in the tight little island without adding a lot of poor home-grown stuff.....

THE Rev. F. O. Morris proposes the organization of what he calls a "Plumage League," an association of ladies formed for the purpose of discouraging the barbarous and cruel fashion of wearing birds or their plumage as ornaments to dress. We say yes, certain!.....

SPEAKING of ranching in the future, the Live-Stock Indicator says that while the West is locked up in immense pastures, growing up into jungles of cactus, mesquite and other growths of almost indestructible vegetation, there can be no material development of that section. Stock-raising should be placed on the basis that it is in Kentucky, fewer in number but finer in blood. Stock-raising and farming go hand in hand, and one should encourage the other.....

MR. THOMAS MEEHAN, the Philadelphia botanist, concludes that the use of the spines in the cactus is to prevent the full force of the sun on the leaves. Plant lovers set out their treasures in Summer under "arbors" of fish netting or galvanized wire, knowing by experience how the moving shadows of the twine or wire lower the temperature.....

THERE is one thing that farmers do not fully realize, viz., the difference between good and indifferent or poor help. The temptation is to hire any help that comes along, at a low price, and to trust to luck that he turns out a good investment. In nine times out of ten, we are disappointed.....

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

ANDOVER, N. B.—An exceptionally fine Winter, with little snow. Hay a very fine crop and correspondingly high-priced. Oats good. The R. N.-Y. Peas very early and prolific—a decided success. Prince of Wales produced a good crop of five large pods, but not nearly equal to Carter's Stratagem, which are a great acquisition. Flageolet Beans a total failure. Rural corn all too late for this climate. Garden Treasures a complete success.

W. B. H.

EAST MINES, Colchester County.—The Blush Potato has done well with me, and I think it is just the potato the farmers want, as it will grow well with less manure than any other good table potato I know of, and I have tried all sorts in the market. It cannot be beat when grown in Nova Scotia soil as a table potato, and as to yield, I will give what it has done with me. In the Spring of 1883 I received two small potatoes, of which I made five hills. I dug 67 potatoes. From these, in 1884, I dug one barrel and a half, the season being the poorest I ever knew in Nova Scotia. These I planted on poor land with a light manuring in the hills, and dug 104 bushels of good, large potatoes, many weighing from one to one-and-a-half pound, having repeatedly dug hills giving 12 potatoes fit for any market, with no small ones. The Diehl-Mediterranean Wheat and the rye I sowed in the Fall of 1884, and gathered two quarts of good, full wheat, and of rye three quarts. The ground was bare, with hard frost until the first of February. I gave it up as lost, but it came up in the Spring and did well. I have sowed both rye and wheat this Fall, but we have had no snow to lie on the ground as yet. But as it came out all right last Winter, I hope for it this, and if it does it will be the hardiest we have ever had. All kinds of the peas were good. Cleveland's is the earliest. The tomatoes were all good, but King Humbert is the best for all uses. The Flageolet Beans yielded heavily, but are small, and I think will not give any more bushels than other sorts I have. The Johnson Grass did not grow. The corn is too late for this climate. The flower seeds were nice and were really admired by my neighbors.

J. E. F.

MOUNT ROYAL VALE, NOTRE DAME DE GRACE, PROV. OF QUEBEC.—Only two or three of the Marlboro Raspberries lived, and they did not grow a foot last year. My flowers did not do well. Neither did the beans; but I never saw such beauties as the peas. The Prince of Wales Pea did well and was good, but the Carter's Stratagem Pea was splendid.

M. E. S.

Dakota.

BEOTIA, SPINK Co.—I like what the RURAL says about Western lands. We men out here on the frontier may be all rascals, but let us believe our women are still honest and true. I know ten young women in this township who support themselves by hard work and yet have made improvements on their claims. They lived on the land all they could. They appeared on their claims every four weeks, ate and slept there, and then went back to their work. When this land was taken the nearest town was 18 miles away. These girls worked in the town and made the journeys to and from their claims, spending every cent they could spare in improvements. One that I know of walked 15 miles in a blinding snow storm that she might sleep on her claim. Another walked from my house one mile and a half through the dark for the same purpose. It takes grit for a women of 25 to spend a stormy night alone in a shanty, with no neighbor within two miles, yet hundreds of our Dakota girls have done it time and again in the hope of making a home. It seems as if women who work so hard ought to have their rights protected. Now, after all this hard work and exposure, Commissioner Sparks says they shall not have a patent, because they have not lived on their claims constantly. It seems hard to think that the United States Government has got so low that it must turn out these noble women. There is no justice in such a decision. Why make war on these defenceless women, who have worked for homes with a patience and devotion that will put to shame many a man? The honest settlers of the Northwest do not support such acts as this. It costs too much work and heart-breaking to make a home out here, without being obliged to do it all over again, when it is once done. G. H. P.

YORKTOWN, Dickey Co., Jan. 25.—Here in far-off Dakota the RURAL finds a welcome in an humble prairie cabin, 12x12 feet, built of boards, covered with tar paper. We burn twisted hay for fuel, and often live in houses built of sods. The reading of the "RURAL" passes many an hour pleasantly and profitably these cold winter evenings. Mercury 12 to 30 degrees below zero. Dakota is a new field of labor, a new country, a rich, productive soil. Thousands upon thousands of hard-working men, poor in purse, have come hither to seek a home. With energy and perseverance, in the course of a few years their object will be attained. Very many of the settlers had no experience in farming, consequently the crops of Dakota have been wheat in the north and corn in the south, these grains finding a cash market—and *cash* has been the needful thing to keep soul and body together in the settler; but the past year the farming has been more of a mixed character, and with excellent results. Flax was raised to a great extent. Millet yields largely; so does barley; while many have paid attention to the raising of stock. The Blue, Bunch and Buffalo Grasses are eagerly sought after by horses, cattle and sheep. Even when the thermometer indicates below zero, stock prefer feeding at the stack to being in stables. Thus the settlers are gradually working into a general mixed farming. Barley is destined to be a prominent crop in the near future owing to its superior qualities as feed for stock. The home production of this cereal will largely increase the raising of stock.

LENOX.

Illinois.

CHAMPAIGN, Champaign Co.—The RURAL seeds germinated pretty well, and did well except the corn and Sorghum halapense; I never saw any of the latter after I sowed it, and only about one-third of the corn came up, and that only had four or five little flinty ears on it. Wheat was a light crop, but of good quality; very little wheat sown last Fall on account of grasshoppers; it looks tolerable yet. Oats were only a moderate crop; the average was about 30 bushels to the acre; generally of good quality. Corn averaged about 40 bushels to the acre, of good average quality.

W. F. H.

Kansas.

DAMORRIS, Morris Co., Jan. 26.—Diehl-Mediterranean all winter-killed. Stratagem and Prince of Wales Peas good—never saw larger. King Humbert not worth growing. Garden Treasures fine. Saved all the Flageolet Beans for seed. Sorghum halapense has not put in an appearance yet.

D. B.

Maryland.

ST. MICHAEL'S, Talbot Co., Jan. 29.—The Rural Peas did well; the tomatoes were of all kinds. The beans did well; but are not favorites either for snaps or soup. Sorghum halapense came up badly and tardily. The Garden Treasures had the season against them, but some did well. The corn did not suit our soil and climate.

J. C. A.

Michigan.

CLIMAX, Kalamazoo Co.—The Rural tomatoes did well, but I do not consider them equal to the old standard varieties. The Prince of Wales Peas bore an enormous crop, but the quality was not equal to that of other varieties which I raised, such as American Wonder, Little Gem, Abundance, Bliss's Everbearing. The Stratagem vines were nearly all destroyed by moles. The corn was all sorts—some small and early and some large and so late that it did not fully ripen.

F. H.

OLIVET, Eaton Co.—The recent article headed "A Board of Agriculture" surprises me. Is it possible that the great State of New York is so far behind the times? We hear on all sides loud complaints about the low prices for farm products, particularly wheat and wool. We farmers of Michigan are seeking to learn the best way of getting out of our troubles. We hold Farmers' Institutes with grand results. If we cannot get speakers from our Agricultural College, we use our home talent. Each year, in connection with the meeting of our county agricultural society, we devote a day and evening to this work. Last week our Opera House was filled to listen to such a discussion of farm topics. Many able papers were presented by our best farmers and their wives. One farmer's wife presented an experience in butter making, which, if followed, would brush away all fear of competition from bogus butter. As necessary in profitable stock-feeding, the following points were brought out: Warm stables, exact times of feeding, quiet and gentleness, daily grooming, no strangers in stables, and variety in food. In crop growing it was conceded that there must be a rotation, constant and free use of clover, all the barnyard manure possible to make, and no more land than could be thoroughly worked. These rules will drive the slip-shod farmer out of existence. Our farmers are becoming more and more interested in these Institutes. They teach the principles, and the fairs show the results. The farmer must study his business. In no place can he do it to such good advantage as in these meetings.

L. S.

[We cannot commend too highly the ideas advanced by our correspondent. It is a shame that the great Empire State is not as progressive in this direction as are the States to which she has sent so many of her sons.—EDS.].

Ohio.

COE RIDGE, Cuyahoga Co.—Horsford's M. G. Pea we liked very well. The Rural New-Yorker Pea is very early and prolific. The tomatoes were very fine, one especially, which appeared like Mayflower. The corn (of 1885) did not ripen (all corn was very poor here this season); but few of the Stratagem Peas came up; I saved enough for seed, so I will be able to test them another year. Prince of Wales Pea was good. But a few plants of Sorghum halapense came up. I did not find any tomatoes that I knew were Bicolors. King Humbert did not ripen well; we did not like it. A small plum-shaped tomato was excellent and very prolific. The Flageolet Beans blighted; it was too wet here for them this season. The Garden Treasures were given to a neighbor and appreciated. There is on this place a cherry tree which is 60 or 61 years old. The seed or young tree was brought here from Connecticut and planted by my grandfather. The circumference is nine feet, five feet above the ground, and below the branches. The spread of the branches is 45 feet. The fruit appears identical with Downer's Late, and until a few years was borne abundantly. The tree is nearly dead now.

A. M. C.

Oregon.

TANGENT, Linn Co.—We are having the finest Winter we ever did see here. Fall wheat made a fine growth. The Rural seeds gave good satisfaction, except the Johnson Grass, which did not germinate at all.

A. L. B.

What You Can Get

By sending One New Subscription.

List 1.—Any PRESENT subscribers who will send us ONE NEW one, may select any one of the following: 12 plants of the Marlboro Raspberry, or 12 plants of the Ranocas Raspberry, or six plants of Golden Queen Raspberry, or eight plants of the Jewell Strawberry, or three plants of the Earhart Everbearing Black-cap Raspberry, or one Poughkeepsie Red, or one Ulster Prolific Grape Vine, or a combination Saw Set, or a beautiful Silver-Plated Butter Knife, or either "Needle Work" or "Knitting and Crochet," by Jennie June, or any book of the "One Syllable Series." See REGULAR Premium List.

FOR TWO NEW SUBSCRIBERS.

Any one sending two New subscribers, may select any three of the plants for one subscriber, or a Niagara Grape Vine, or a Louderback's Combination Tool, or a Needle Hay Knife, or a Pearl Rug Maker, or a Dust-pan, or a Pair of Shears, or a Knife, or a Shot Flask, or a Watch Charm, or a Harmonica, or a Premium Drill, or "Stop Thief" Scale, or any one of the following books: American Political Ideas, Uncle Tom's Cabin, Fruit Culture, Talks Afield, How to Paint, Low Cost Houses, Comforting Thoughts, Highways of Literature, Boy's Useful Pastimes, What Girls can Do; Simple Ailments of Horses.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time.]

FRUITS IN EASTERN MASS.

J. E. G., Cambridge, Mass.—1. How should a Duchess dwarf pear tree be treated which blossoms very profusely every year, but never sets and holds fruit? 2. Is there any perfect-blossomed strawberry as large, vigorous, productive and evenly-ripening as the Manchester, to be used as a fertilizer with it? (Sharpless is unproductive with me; Miner does not ripen evenly all over like the Manchester; Cumberland is not productive enough; Downing is a failure; Bidwell is an uneven ripener). Would the Parry fill the bill? 3. Would the following stand the Winters of Eastern Massachusetts? Downing's Mulberry, Pecan Hickory, Præparturien's Dwarf Walnut, Spanish and Japan Chestnut. If the Downing's Mulberry would not, what sort would? (Black English?) What magnolia and what catalpa will stand the climate?

ANS.—1. Such an unusual occurence as a Duchess pear or quince blooming well, yet failing constantly to set any fruit, would lead one to suspect that a wrong bud was set of a sort with imperfect flowers, or possibly bud variation from a genuine bud. It may, perhaps, be due to over-nutrition. Any answer must be but a guess. 2. There is no perfect-blossomed strawberry as large, productive or as evenly ripening as the Manchester. The varieties named not being satisf :tory, we would recommend a trial of the Par y, which is a fine berry, although not as pro. uctive or evenly ripening as the Manchest. . 3. Downing's Mulberry and Juglan's præparturiens will not be winter-killed in Eastern Mass. Pecan hickory would suffer and probably fail to produce fruit, and the same might be true of Spanish Chestnut. Japan Chestnut has not been tested long enough. Both catalpas stand in Boston gardens, but C. speciosa is the hardier. Magnolia glauca is a native of E. Mass., and Gray says M. cordata is hardy at Cambridge. Probably M. acuminata also. Any nurseryman about Boston can answer these questions. Why not ask Mr. Hovey?

WOLF TEETH IN HORSE.

F. S., Washington, Pa.—1. My four-year-old horse had a "wolf tooth" in his upper jaw. It was knocked out more than a week ago; but the eye is still very weak and discharges water; what can be done for him? 2. For more than a year he has had a swelling about half way between the knee-joint and pastern of a hind leg, due, it is thought, to a kick more than a year ago. Sometimes it disappears, but reappears again, especially when he has been standing in the stable; what should be the treatment? 3. Are sweet pumpkins, fed raw, good for milch cows? 4. What is a good fodder cutter?

ANS.—1. The horse at this age is cutting the last of his permanent set of teeth, and the back upper molars, which appear at about this age, are in close proximity to the eyes. The irritation consequent upon the eruption of 12 or 16 teeth is considerable, and is frequently communicated by sympathy to the eyes. After the complete eruption of the teeth, the eyes usually recover without treatment. In severe cases a laxative (four or five drams of Barbadoes aloes), with warm fomentations to the eyes and exclusion of the light, is usually all that is necessary. The knocking out of the "wolf-tooth" was a mistake and an unnecessary cruelty to the animal. It would be just as sensible to knock out any other tooth as this one, which, of all others, could in no way produce any effect upon the eyes. It will be well, however, to carefully examine the eyes to see that they have received no external injury, or that there is no foreign body present to produce the irritation. If due to these causes, one eye only would probably be affected. 2. It ought to be removable. Try painting with tincture of iodine. 3. The pumpkins are excellent fed in moderate quantities and supplemented with dry or concentrated fodder. But if fed in too large quantities, they are positively injurious. If fed otherwise than broken up in an open field, the seeds should be removed. 4. A good fodder cutter is the "Sherman," made by the Higganum M'f'g. Corporation, Higganum, Conn. Another is Dick's Stalk Cutter, for sale by H. B. Griffing, Cortlandt St., New York.

BRAN AS FEED; ETC.

Wm. A. S., Tyre, N. Y.—1. There is a good deal of talk in the papers lately about cutting hay; will it pay, and if so, what machine will cut as short as three-sixteenths of an inch, and how much power will it take to run one? 2. Mr. Stewart gives the feeding value of bran as 33 per cent. more than that of clover hay; Mr. Allen gives it as five per cent. less; which is right? 3. Is roller-process bran of as much value as the stone-ground? 4. Has Allen's American Cattle been revised since 1868? 5. What are t e best books on cattle management and feeding?

ANS.—1. We do not believe it will pay. We have tried it and have abandoned it; any first-class cutter can be set to cut so short; but there is no advantage in cutting shorter than three-eighths or one-half inch. 2. Dr. Wolff's tables give the comparative prices as 70 cents for clover hay and $1.01 for bran. Assuming the prices used in the German tables for the nutritive elements as being as fair for one as for the other, it fixes the comparative prices per ton as $18.40 for clover hay and $24.84 for bran; or, dividing each by two, the comparative values are $9.20 for clover and $12.42 for bran, which is, no doubt, nearly correct. 3. It is of more value as appears by Dr. Jenkin's tables and by all other analyses. 4. Yes, there is a new and revised edition. 5. Stewart's Feeding Animals and Armsby's Manual of Cattle Feeding are the latest and best. The former can be obtained from Prof. E. W. Stewart, Lake View, Erie Co., N. Y.; price $2; the latter from John Wiley & Sons, 15 Astor Place, New York. Price $2.50.

PREPARING BONES FOR A FERTILIZER.

J. C. C., Somerset, Ky.—1. Will any of the Wilson lower-priced bone mills grind bones fine enough for fertilizing purposes? 2. Will it pay to buy dry bones at 40 cents per 100 pounds for fertilizing? 3. How can they be best prepared where hard-wood ashes are not to be had?

ANS.—1. They will grind fine enough, but they grind slowly—too slowly for use in grinding for this purpose. 2. Forty cents per 100 pounds is $8 per ton, and it will certainly pay at that price whenever the land needs phosphatic manure, which is probably the case in Kentucky. 3. Break the bones as fine as possible with an old ax, or, better, with a sledge. Make a heap of fresh stable manure from 10 to 20 feet square and a foot deep, leveling down and treading moderately. On this spread four inches of the broken bones, then another layer of manure and more bones, having a layer of manure on the top. It will be better if the sides are protected by boards or a layer of sods, so as to confine the heat. Keep the pile nicely wet, but not so damp as to drain, and all the better if wet with chamber and house slops. In three months it should be forked over, when the bones will be found mostly decayed, so much so as to crumble to dust. The larger and unrotted bones can be put into another pile.

MANURE QUERIES.

A. J. M., Auburn, N. Y.—1. Aside from feeding to cattle, what is the best way to reduce straw to a condition to be used on clay land as a manure? 2. Would mixing gas lime with half-rotted straw help to reduce the straw to manure? 3. Would a mixture of salt, plaster and lime be beneficial to all crops?

ANS.—1. There is no way by which the manurial value of the straw can be increased. If it be thrown down into the barn-yard and trodden under the feet of the cattle, it will only be wet straw. If we wished to use it on such land, we would draw and spread it as convenient, and plow it in next Spring. 2. No. It would rather have a tendency to preserve it. 3. No. Everything would depend upon the soil and the crop to which it is to be applied. To some crops one might be beneficial, and another of the three injurious. A trial of each and the mixture would be the only positive way to learn.

Miscellaneous.

A. F. H., Dansville, N. Y.—How can I cleanse a kerosene barrel so as to fit it for cider?

ANS.—Scald it out with hot water several times over, and then submerge it in a stream or pond with the bung out and also the spigot in the end open. The oil will all come out of the staves and float on top of the water. Running water is the best.

W. C., Carthage, Mo.—Where can I get the Jewell Strawberry by the hundred, and at what price?

ANS.—Of the originator, P. M. Augur & Sons, Middlefield, Conn. We don't know the price.

J. B., Marlboro, N. Y.—All important information about telephone matters should be sent to Secretary Lamar, of the Department of the Interior, Washington, D. C.

H. C. B., Porteau, Ark.—Yes, indeed; W. H. Moore, Subscription Agent, Brockport, N. Y., is quite reliable.

T. R. M., Middletown, Va.—You can get all from J. M. Thorburn & Co., 15 John Street, New York.

DISCUSSION.

R., OMAHA, Neb.—In a late RURAL James Sinclair, in an article on shoeing horses, says we are without evidence of the successful use of unshod horses. Here in Nebraska the shoeing of farm horses is exceptional, the majority of farmers never shoeing their horses, and we find that those which have never been shod have the best feet, while horses that were formerly shod are not as sure-footed, and the feet often need trimming or doctoring.

On the same page Professor Sanborn advises the young man without capital to change his system of farming, and to feed cattle and hogs in a costly barn. Does he think we can afford to mortgage our farms, at 10 per cent. to buy the cattle and hogs? If we tried this but few of us could raise money enough on our farms to buy half the required number, and then it would be necessary to borrow money on our cattle at two per cent. per month, and renew our notes every 90 days, for the building. If the Professor would come out here with the young men of Kansas or Nebraska, and try farming without capital, he would find it necessary to feed cattle in a sod stable and use straw roofs.

R. N.-Y.—Our friend does not quite comprehend the argument of Prof. Sanborn. As we understand it, the Professor would advise every farmer of the West to procure stock for feeding purposes, wherever he can do so, in order that the corn and other crops may be fed at home and only the resulting meat be sold. Whenever this can be done, even at a moderate profit, then the manure can be saved and returned to the farm to grow other crops. Moreover, by thus concentrating corn and other bulky food stuffs into beef and pork, the cost of transportation to distant markets is greatly reduced, an item the importance of which railroad greed never permits the farmers to forget. Further, the Professor would not, by any means, object to the sod barn with a straw roof. His point is that warm barns and houses for all stock save food, no matter how the barn be made, whether of straw, sods, stones or boards and paper, so long as it is warm, dry and well ventilated. We have seen sod stables and sheep houses in Nebraska as warm and comfortable as is our new barn on the Western N. Y. Farm, and no doubt such would produce just as good results. We have also seen those made of poles placed in two tiers, the space between which was filled with straw, that were a hundred times preferable to the exposure of the stock to fierce winter winds. The straw piles the fires of whose burning so often reddens the evening sky in the Prairie States, if used to house and shelter the stock, would add many thousands of dollars to the income of the stock feeders.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, February 6, 1886.

"SMOKE Your MEAT"
With Krauser's Liquid Extract of Smoke.
It is a liquid; you wash it on; it will keep it in a well preserved condition and free from insects; it is much more pleasant to the taste than meat smoked in the old way; it is done in less time, no trouble, and less expense. There is no danger from fire or of being stolen, as you can hang it in a more secure place than a smokehouse. Send for circular.
E. KRAUSER & BRO., Prop's and M'f's, DRUGGISTS, **Milton, Pa.**

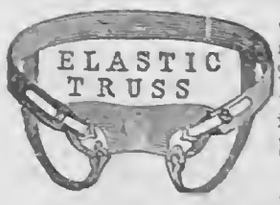
WE WANT ACTIVE AGENTS
TO SELL THE
Renner Combined Alarm and Door Bell
In every County in the United States and Canada. Geo. C. Owens, Modesta, Cal., says: "I have canvassed one day and took 22 orders." In same letter he ordered two gross. Wm. McKim, of Grand Haven, Mich., says "he took 13 orders in 10 hours." Profit on Bell, $2.50. In our EXTRAORDINARY OFFER to Agents we agree to take back all Bells unsold if the Agent fails to clear $125 in 30 days. Illustrated Circulars sent free. Address
RENNER MANUF'ING CO., Pittsburg, Pa.

SEND for new 64-page Catalogue and Price List of **Heavy and Light Single and Double Harness** manufactured from **Best Oak Leather,** all hand made, at Wholesale Prices to the consumer. KING & CO., Owego, N. Y.

HUMPHREYS'
Homeopathic Veterinary Specifics for
HORSES, CATTLE, SHEEP, DOGS, HOGS, POULTRY.
Used by U. S. Governm't.
Chart on Rollers, and Book Sent Free.
Humphreys' Med. Co., 109 Fulton St., N. Y.

Agents Make $5 a Day Selling Perfect FAMILY SCALES
Entirely new in principle. Weigh one ounce to 25 pounds. What every family needs and will buy. Rapid sales surprise old agents.
FORSHEE & McMAKIN, CINCINNATI, O.

BEST TRUSS EVER USED!!



Improved Elastic Truss. Worn night and day. Positively cures Rupture. Sent by mail everywhere. Write for full descriptive circulars to the
NEW YORK ELASTIC TRUSS CO.,
744 Broadway, N. Y.

TELEPHONES SOLD.

Don't pay exorbitant rental fees to the Bell Telephone Monopoly to use their Telephones on lines less than two miles in length. A few months' rental buys a first-class Telephone that is no infringement, and works splendid on lines for private use on any kind of wire, and works good in stormy weather. It makes homes pleasant; annihilates time; prevents burglaries; saves many steps, and is just what every business man and farmer should have to connect stores, houses, depots, factories, colleges, etc., etc. The only practicable and reliable Telephone that is sold outright and warranted to work.
Chance for agents. No previous experience required.
WM. L. NORTON, Buffalo, N. Y.

W, R & CO'S IMPROVED BUTTER COLOR
IF YOU REALLY WISH to use the very best Butter Color ever made; one that never turns rancid, always gives a bright natural color, and will not color the buttermilk, ask for Wells, Richardson & Co's., and take no other. Sold everywhere.
MORE OF IT USED than of all other makes combined. Send for our valuable circulars.
WELLS, RICHARDSON & CO., Burlington, Vt.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, FEBRUARY 13, 1886.

Subscribers of the RURAL *need never take the trouble to write us to "stop" the paper. It is invariably discontinued at the expiration of the subscription term, except by oversight, in which case it is our loss.*

WE are now preparing our next Potato Special.

THE Seed Distribution has been mailed to all who applied for it prior to January 10th.

WE have twice as many articles already as will suffice to fill our second POTATO SPECIAL to be issued in a few weeks.

IF the number on your address label is 1881, your subscription expires with this number; if 1882, next week; 1883, in two weeks, etc.

ONE of the RURAL's best friends writes: "I am sorry to see you lending your influence against Land Commissioner Sparks. The best information I can get is to the effect that he is doing an admirable public service."

PROF. BURRILL, after much experimenting and trial, now says most emphatically that the fruit, popularly so called, is not in the least affected by the kind of pollen used in the fertilization of the ovules. That this conclusion is essentially correct, we have little doubt.

THE RURAL does not wish to say too much in regard to the $3,300 offered in presents to subscribers who send us clubs. We think, however, that our friends will not be deceived if we assure them that they may be surprised at the value of the presents which even small clubs may secure.

"A TEXAS cow-boy's wife," writing from a cattle ranch, says the RURAL only makes her homesick. It comes into that dry and treeless region only to make her think of what the world outside is like. Yes, and so would her mother's picture make her homesick, and yet she would be happier for having it.

LET us say to all that the RURAL of November 14th, 1885, gives a full illustrated description of our Free Seed Distribution, together with a full list of the $3,300 worth of presents to be sent to subscribers (and to them only) who secure clubs for the RURAL NEW-YORKER. This Number is sent to all who apply for specimens.

ONE of the most successful potato growers in New York State says that he never thinks of marketing his crop without first examining the "Everywhere" reports in the RURAL. He can generally tell pretty clearly from these reports how large a crop has been raised, and how the probable supply will affect the price. Reports of this nature have come to be a valuable department of all the successful agricultural papers. Farmers begin to appreciate this method of comparing notes, particularly when the experience of a number of years has convinced them that the reports are not a series of opinions but a list of facts.

THE Japan Chestnut—we propose to talk about it; to keep it before the eyes of our readers, so to say. It is one of those good plants that crop out now and then among the "Novelties" which though ninety-nine prove worthless, the one-hundreth repays for all one's trouble. So far as we can judge, it will take a high rank as an ornamental tree, as it inclines toward a short-jointed, bushy habit. It bears very early, sometimes in three or four years even from the seed. The nuts are nearly twice the size of our American chestnuts, and the quality nearly as good. Of course seedlings will vary in every way. Next week we shall have more to say of the Japan Chestnut.

THE wandering subscriber generally becomes about as unsettled as the man who is continually moving. When a man takes one paper this year, another the next, and so on, he loses one of the best features of newspaper companionship. Every good paper draws a regular family about it, and the members come to know each other better and better as time goes on. Men betray their characters in their writings, and as we study their thoughts from year to year, we become so well acquainted with them, that, should we meet them, we would hardly need an introduction. This companionship is not gained in a single year. It is something that the wandering subscriber never knows, and yet it is, oftentimes, the best return one can get for the subscription price.

A FEW years ago what a sensation was caused by glowing accounts of the success of bonanza farming in the Northwest! The magazines and newspapers fairly reveled in pictorial and verbal descriptions of illimitable wheat fields, steam and gang plows in platoons, reaping machines in squadrons, and working-men in divisions! Who ever hears of bonanza farming now? Fortunately for the country it has been found that big farms do not pay. Nearly every experiment has resulted in the collapse of wealthy capitalists and corporations. The few big farms cannot compete with the many small ones carefully and economically tilled by their frugal owners. A fortunate discovery this, not only for the West but for the entire country, for the prosperity of the Nation depends largely on the success of a multitude of small farms personally managed by their owners. The soil for the tillers thereof!

NOTICE TO SUBSCRIBERS.

IT is our duty as well as our pleasure to inform our subscribers, who are kindly interesting themselves in increasing the RURAL's circulation, that the list of $3,300 worth of presents is being almost entirely set aside in favor of our regular premium-list, which offers certain articles for specified numbers of subscribers. The reason, in so far as we can find one, is that all seem to take for granted that *others will be entitled to them.* The fact at this time is simply that we offer twice as many presents in this gift list as there are competitors for them, and that even the most valuable will be awarded for merely nominal clubs.

THE Galloway breeders of Michigan recently effected an organization. As an evidence of the fact that they believe in the superiority of the breed of cattle they represent, it may be noted that they decided to confer with Prof. Samuel Johnson, of the Michigan Agricultural College, in regard to the experimental feeding of different breeds of cattle on the college farm. If arrangements can be made, the Galloway men will furnish two of the best specimens of their favorite breed to be fed under the direction of the college authorities. We hope the other cattle associations of the State will make similar provisions for furnishing cattle, and that the arrangements can be completed for feeding at the college. Many farmers at present complain that feeding experiments cost too much. The college authorities are frequently accused of selecting good specimens of one breed and poor ones of another, and thus insuring a victory for their favorites. Where the various breeders pick out the best specimens they can find and send them, free of charge, to a disinterested party, the test will be as nearly satisfactory as we are likely to get.

AT a representative meeting of the Associated Chambers of Agriculture of England, held in London last Tuesday, speeches were made strongly favoring protective duties on foreign grain, sugar and manufactures. A Royal Commission is now investigating the depression in trade prevalent in all parts of the United Kingdom, and it is expected that this body's report will favor a protective or "fair trade" tariff in "Free Trade" England. The English farmers will wait for the issue of the report before starting an agitation for protective duties on foreign agricultural products. In this they are likely to be backed up by a large body of manufacturers who favor an agitation in behalf of "Fair Trade," another name for retaliatory import duties on goods from those countries which tax imports of British products. "Protection" and "Fair Trade," had considerable influence in the last English elections; and are likely to have more in the next; but Free Trade is very likely to sway the masses at least in our day. English farmers are, of course, quite justified in agitating for "protection" of their own industries; but the comparatively small body of English farmers are not likely to have more influence on national legislation in England than is exercised by the immense body of American farmers in this country. The farmers' day is coming, however—at any rate let's hope so.

SO flagrant have been the abuses in illegally grabbing the public lands, especially under the Pre-emption and Timber Culture Laws, and so thoroughly permeated with fraud and knavery have been a large proportion of the officials connected with the administration of these laws, that both the present Congress and the last dispaired of being able to devise any effective remedy for the evils short of the entire repeal of the Pre-emption and Timber Culture laws, and a radical amendment of the Homestead Law. A bill reported by the Public Lands Committee of the Senate provides for this extreme form of reformation; but allows all valid claims heretofore initiated under these laws to be perfected. Entries hitherto made under the Pre-emption Laws, which have been proved up, paid for and sold to innocent purchasers, are confirmed upon proof of sale, despite any irregularity or taint of fraud on the part of the original entrymen. This is only fair. Why should the innocent be made to suffer for the guilty? The lot of the honest poor pioneer settler is at the best hard at the outset, why should the Government add to his troubles and hardships? The area of public land suitable for agricultural settlement is, however, decreasing so rapidly that the most stringent measures should be adopted and enforced to preserve what still remains for *bona-fide* homesteaders.

THE ITHACA FARMERS' INSTITUTE.

WE are very desirous of having a representative farmers' meeting at the Farmers' Institute, at Cornell University. We therefore again call special attention to the meeting to be held at Ithaca, on Tuesday, Wednesday and Thursday, February 16, 17 and 18 inst. Prof. Roberts informs us that 15 or more short papers are promised from very able persons on subjects relating to farmers and farming; after each of which the subject presented will be open for discussion by the audience. The day meetings will be held in the University buildings. On Tuesday and Wednesday evenings addresses will be delivered in some large down-town hall by President Adams and Mr. W. Powell "On the Influence of Climate, Soil, etc., upon the Breeding of the Animal Species." Railroads, so far as at present heard from, have promised reduced rates on return tickets to delegates. The headquarters will be in the Faculty Room in Morrill Hall. We hope that every farmer who can do so will make it a point to be present and take part in this meeting. We want it to be shown that New-York farmers are awake to what concerns them, and earnest to obtain the knowledge necessary to do better farming.

WE ARE NOT OPPOSED.

FROM numerous letters received since the appearance, several weeks ago, of our editorial regarding the rulings of Land Commissioner Sparks, regarding claims under the Homestead Law, it seems we have been somewhat misunderstood. We only intended to take issue with the Commissioner in so far as his orders worked injustice to honest people who had acquired homesteads in accordance with the then interpreted meaning of the law, and that we were right is proven by the fact that he has since modified his orders in accordance with our views. We fully believe that the intention of the law was to give the public land to actual settlers, that every 160 acres might be occupied and improved, and that thus the Government's unoccupied wilderness should be changed into towns and agricultural communities teeming with an industrious, busy people. We believe it not only the right but the duty of the Commissioner to make such rules as shall most effectually secure this very desirable end. We have no doubt that it would be within his powers to compel every person desiring to secure a home under the Act, to at least reside on and improve the land during the Summer months of each year, and this very likely would be for the best interests of the homesteaders themselves. But there were and are thousands of poor, honest people, men and women, who have complied with the law as interpreted by former Commissioners, and who we believe are equitably entitled to their homesteads, and we are glad to see the modification in this respect of Commissioner Sparks's orders.

That the laws have been very loosely construed we are certain. That gross fraud and dishonesty have in too many districts and instances enabled capitalists and corporations to gobble up thousands of acres of the best lands we have no doubt. That many a shanty has been worn out in being moved from claim to claim and occupied alternately by different persons in "living upon their claims" a night or two a month is a common talk at the Far West. That thousands and thousands of acres have been homesteaded only for the purpose of being sold to some speculator, and in securing which the law was never honestly complied with, is proven beyond a doubt by the extended tracts now pretended to be owned by some land-grabber on which there has never been a furrow turned or a stake driven, and on which a shanty did not remain two consecutive months at any one time.

We are glad the Commissioner is investigating these cases. We hope he will persevere in the good work and recover for the Government, for the use of actual settlers, all these rich acres so unjustly obtained.

This is but justice to the isolated "steaders" who are now compelled to live miles away from neighbors because of the holding of these lands all about them, and whose improvements help to increase the value of these grabbers' claims, on which nothing has, or will be done in the way of improvement so long as held by these non-resident sharpers. Let the good work go on. The RURAL has no wish to place any obstacle in its way.

BREVITIES.

QUEEN of the Fall, the Chrysanthemum.

THE good word now, good friends of the RURAL NEW-YORKER.

ONE of our friends, after writing us as to potatoes, signs himself "Your Beauty of Hebron, Fred Grundy."

OUR friends who followed the RURAL'S advice, given last Fall, to save their potatoes for better prices, have not had occasion to regret it.

THERE are probably as many as from 400 to 500 different varieties of Chrysanthemums that have been displayed at the various shows of the past season.

WE have yet to report upon the following new varieties of tomatoes, viz.: Alpha, Optimus, Challenge, Belle, Exquisite, Tom Thumb, Eclipse, Hovey, Carter's Acme and Early Market.

THIS week we are mailing the RURAL'S Free Seed Distribution to subscribers in England, France, Germany, Austria, Italy, Hungary, India, Australia, New Zealand, Africa and Sandwich Islands.

THE chief mission of fools seems to be to play into the hands of knaves. If the world were not so full of nincompoops, how could the Florida land swindlers and similar rascals "lay their lines in such pleasant places?"

MR. ROBERTS, who sent us the drawings for the device for salting butter, shown on page 54 of the RURAL, says our engraving is correct in every respect, except that the "bag of nails" or weight, used to balance the rack and butter bowl, is attached to the extreme end of the long arm of the steelyard instead of at A, as there stated. Any of our readers who think of making such an appliance should make a note of this.

THE wealth of a country is not its banks and bonds and hoarded money. It is the good sense and muscle of its workers and the brains of its thinkers. There may be hidden away, in its mountains and rocks, stores of metal and coal that, if put in machinery and used to run it, would accomplish the labor of millions; there may be in the farmers' fields fertility for the production of food for the world; but without the brain and muscle to do the mining and to work the soil and to put the products into usable shape, they are of no advantage. We see then how important it is that the Nation should foster and care for the laborer and thinker and should see that the money bags do not get more than their share of the profits.

WHAT are beans? The wisdom of the United States Circuit Court in this State has lately been taxed to decide this knotty question. In 1884 a decision of the court placed beans in the category of "garden seeds," on which there is an import duty of 20 per cent. Later on, they were placed among "vegetables," on which the duty is only 10 per cent. Last week it was decided that they must be admitted free of duty under the classification of "beans—drugs not edible in a crude state." If this decision is upheld, it will be of considerable importance to the bean-raising industry here and in Canada, and will take a fair sum from the National Treasury in the shape of repayment of improperly levied import duties.

Indust'l Societies.

WESTERN NEW YORK HORTICULTURAL SOCIETY.

(RURAL SPECIAL REPORT.)

(*Concluded.*)

Ammonia arresters; new fruits;—berries; grapes; quinces;—remedies for blight; insecticides; last season's fruit crops; repaying our orchards; best fertilizers for orchards; reform needed in vegetable names; best dozen hybrid perpetual roses; fine displays of fruit, etc.

MR. SMITH, of Syracuse, said he always used salt for scattering in and over manure when putting it into compost heaps, and he also thought it valuable about pear and quince trees. Mr. Root thought salt had great power to absorb both moisture and ammonia. Dr. Caldwell said the only good salt can do a manure heap is by its absorption of moisture; salt has no affinity for ammonia or nitrogen. Water or damp earth would be a much better addition to the manure, and gypsum would be much better than either, as that would really absorb and fix the ammonia.

In discussing new fruits, the Marlboro was highly commended. Hansel had proved disappointing to nearly every one. Rancocas so far as tried, was well spoken of. Shaffer is gradually working its way into favor. Dr. Van Duzen, of Wayne County, said it was the finest berry for drying of all he knew: 4¼ quarts made a pound and the dried fruit, even in these low-priced times, readily sold for 30 cents per pound. Mr. A. J. Caywood, of Marlboro, N. Y., had a new white raspberry, which he would send, free of cost, to all who wished to test it. The Jewell Strawberry had in every trial proven very satisfactory. Parry pleased many by its good quality, but was reported deficient in foliage. The old Wilson still has many friends in Western New York.

Among grapes, Worden and Moore's Early were in good favor. Niagara is rapidly gaining favor in New York. What was said of it more than substantiated the opinion heretofore given by the RURAL. Jessica, Poughkeepsie Red, Ulster Prolific and Empire State were all mentioned favorably, but no one present, except the introducers, had fruited either.

The Apple Quince was recommended for general culture in Western New York, but when asked just what the Apple Quince was, no one could describe it. There is great confusion in quinces, and people cannot be too careful in buying so-called new sorts. Mr. Ellwanger considered Rhea's Mammoth the best of all quinces—Champion was pronounced too late.

Prof. Arthur, of the Experiment Station, in discussing remedies for pear blight, said the application to the soil, to the bark of the tree, to the limbs or foliage, of sulphur, salt, lime, etc., could have no effect upon the disease. He recommended the selection of healthy varieties, good cultivation, proper manuring, etc. The best remedy now known is to cut from the trees promptly, on the first appearance of the blight, every limb or branch showing its presence, cutting at least a foot below any sign of it, and the immediate burning of the parts cut off.

In a discussion on insecticides the evidence was so strong that no one can doubt the efficacy of Paris-green and London-purple in destroying canker-worms and also codling moths, as well as curculios.

In the reports from County Committees as to the extent of the fruit crops and condition of the orchards, there was uniformly an abundant crop of pears, and consequently low prices. Apples were very abundant in the extreme Northwestern Counties, and quite so in many others as far east as Central New York. Niagara is the banner apple county of the State, and probably of the world, when compared with an equal number of acres anywhere else. The reported yield was 700,000 barrels of shipping apples, 250,000 of evaporating, and 150,000 of canning apples, and no body pretended to keep any record of how many went to the cider mills. One mill alone took as many as 6,000 bushels in a single day. The last was the largest crop ever grown in the county, and probably in any like area in any country. The buds of the peach trees were reported killed at Geneva, Waterloo and other places in central New York.

Mr. Powell thought our fruit growers should bestow better care on their orchards, and could see no reason why we could not profitably raise fruit at present prices, when Californians can raise it on land costing twice as much per acre, ship it thousands of miles, paying heavy freights, and sell it at a profit in competition with ours.

Mr. Woodward, in answer to the question, "What should we do to pay our orchards for the last fine crop of fruit?" said, first, we should realize how badly we had been robbing them, not only by the annual large crops of fruit which have been all taken away; but also by cropping them with grain. All that has been given back has been a little wet straw, trampled perchance by the stock, which we in our foolishness have called manure. We should realize the extent to which we have exhausted the land, and then study how we can restore it to its original fertility. The best of all manures for an orchard is barn-yard manure made by the consumption of rich feeding stuffs, thousands of tons of which we are now annually exporting. There is no doubt but this can be made on every farm of Western New York at a good profit, if the farmer only has the requisite knowledge. He did not believe it would pay to buy the ordinary manure of the cities for application to our orchards.

He said the orchards needed potash, phosphoric acid and nitrogen. The potash could be got in wood ashes or in kainit, sulphate and muriate of potash—he thought most cheaply in the latter. Phosphoric acid could be had in South Carolina phosphatic rock, in the apatite of Canada, and in bones. He thought the latter the best, all things considered. Nitrogen can be obtained in blood, tankage, fish scraps, nitrate of soda and sulphate of ammonia. In superphosphate, as sold, we usually get all three of the above elements, but pay an extra price for having them in a more soluble and available form.

Mr. Goff, of the Experiment Station, in a paper on vegetable names, said he often found a single vegetable with eight or ten new names; often a single seedsman offers the same thing under two or more names. We want some authority with power to test and report on varieties, and also to reform names. As bad as were some of the old names of fruits, they were as nothing compared to the names of vegetables. We think there is a crying need for this good work, and the New York Experiment Station is doing much to help it along. We hope the stations will soon speak right out and let us know who is responsible for this jangle and confusion.

Mr. Geo. Ellwanger, in discussing hardy hybrid perpetual roses, named as the best 12 for Western New York, Alfred Colomb, Anna de Diesbach, Baron de Bonstetten, Baroness Rothschild, Eugene Verdier, Fisher Holmes, John Hopper, Marshall P. Wilder, Paul Neyron, Madame Gabrielle Luizet, General Jacqueminot, Francois Michelon and Caroline de Sansal. He recommended to hill the soil up six inches high about each plant, and then to cover the whole with a foot of straw as the best treatment for wintering.

Messrs. Ellwanger & Barry made their usual fine display of fruits, showing 27 varieties of apples and 20 of pears. There were over 100 plates of fruit, among which we noticed a new variety of grapes from the above firm, two new seedling apples from A. M. Smith, St. Catherines, Ontario, Canada; the Mildling Apple shown by R. G. Chase & Co., Geneva; also some Catawba Grapes from A. G. Newton, Parma Center; also a basket from Mr. Sanderson of Crooked Lake, all in splendid order. We also noticed a combination picking and shipping berry crate exhibited by our friend, George Wilkin, Dundee, N. Y., which struck us as being very strong, handy and practical.

"W."

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

JAMES VICK, Rochester, N. Y.—Vick's Floral Guide, 150 pages, full of illustrations, clear print and interesting, plain instructions. A colored plate of gladioli is the best we have seen, and is worthy of a frame. This old, good firm is very chary as to novelties, testing them carefully before offering them for sale. The catalogue commends the Eclipse Beet as to quality, earliness, shape and color. King of the Garden Lima Bean, Vick's Dwarf Cauliflower, Low's Early Cabbage, Arlington Celery, Perry's Sugar Corn, Cory Sweet Corn, all the new melons, several kinds of peas, radishes, turnips, Vick's American Banner Oats (which we shall try), spring wheats, winter wheats and many floral novelties are highly commended. Ten cents is the price of the Guide, which, in case seeds or plants are ordered, may be deducted from the order.

JOHN SAUL, Washington, D. C.—1st. A descriptive catalogue of a selection of roses. Here we have the grand new roses, Wm. Francis Bennett, American Beauty, and Her Majesty, which latter bears the largest flower of any in cultivation, namely, six inches in diameter. The list of all the classes of roses is well selected. 2d. A descriptive catalogue of new, rare and beautiful plants, including new pelargoniums, Pitcher plants, Crotons, Ferns, Alocacias, Yuccas, Palms, Begonias Primroses, Bouvardias, hardy trees and shrubs, Caladiums, Coleus, Fuchsias, Dahlias, Chrysanthemums, Carnations, Azaleas, Cactuses, Bamboos, etc., etc. These catalogues will please many of our readers. Send for them and mention the R. N.-Y.

THE CLEVELAND AXLE MANUFACTURING CO., Cleveland, Ohio.—Circular and price list of the various axles made at the above factory. It contains illustrations of the half patent, the swell taper, Brown pattern axles and also of the celebrated Arrow sand-band axle, and the Kritch improved self-lubricating axle, in perfecting which this firm has spent much time and which has justly a wide and favorable reputation extending even abroad; and so favorably are the goods known in other countries, that the company has already a large export trade. We advise all who wish a first-class axle to send for these circulars and read up on this point.

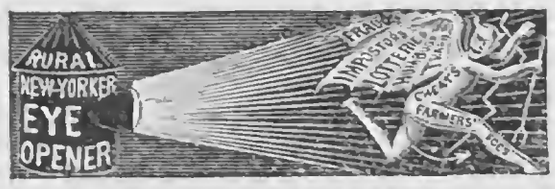
JOHNSON & STOKES, Philadelphia, Pa.—A catalogue of seeds of all kinds; also eggs for hatching of Wyandottes, Langshans, Plymouth Rocks, Houdans, turkeys and ducks; also sheep, swine and collie dogs. The new Christmas Watermelon is praised in high terms. There is no end to novelties, several of which we hope to test next season. The catalogue will be mailed free to our readers who apply as above.

PRICE & KNICKERBOCKER, Albany, N. Y.—Illustrated catalogue of seeds, etc. Among novelties, the Conqueror and Sunrise Potatoes, Surprise Musk-melon, Pee & Kay Sweet Corn are specialized. This firm offers *collections* of potatoes from 20 to 400 different kinds, one tuber of each put up separately, charging from five dollars upwards.

Z. DEFOREST, ELY & CO., Philadelphia, Pa.—Garden Almanac and Seed Manual (95 pages). Various onions, squashes, lettuces, beans and peas are offered among the specialties. Among peas, we see the Prince of Wales and Rural New-Yorker, both introduced through our Free Seed Distributions.

E. & J. C. WILLIAMS, Montclair, N. J.—A circular of the new and promising strawberry, the Jewell. A second circular of the Niagara Grape—the "white grape for the millions." A pamphlet of fruit and ornamental trees, grapes, small fruits, etc. All will be mailed free on application to the above firm.

A PLEASANT EXCURSION.—People in the East, whether North or South, who are tired of the tremendous cold weather of the present Winter and who wish to get to a sunny clime and luxuriate amid fragrant groves laden with the finest fruits, should take advantage of the excursions which the Burlington Route is now running from the Missouri River in connection with either the Central or Southern Pacific Railroads. They connect at Omaha and Pacific Junction with their regular trains from Chicago, Peoria and St. Louis. First-class excursions leave for Los Angeles February 17th, and for San Francisco March 3d. Very low rates are made to all California immigrants on every Wednesday until June 30th, inclusive. We only wish we had the time and money; we would get where it is warmer, on the double quick.



IN answer to many inquiries sent to us of late about Florida land schemes, we condense the following particulars from a mass of information of the absolute correctness of which we are assured. It is the result of personal inquiries of friends and acquaintances living near the places mentioned, or who are well acquainted with the localities and with the parties who have launched the enterprises, or their Florida agents. Much of it has been confirmed by reports furnished to the Herald of this city by a special Commissioner sent to Florida to investigate the matter. Investigations of such subjects are necessarily very slow by correspondence, for unless one is personally acquainted with the parties questioned, there is no assurance that the answers will not be misleading. Indeed, we have received several letters with regard to the character of some of the places, which we *knew* to be false. One of these purported to be from a clergyman who professed to know all about Sarasota Bay, the advertised misrepresentations about which we exposed in the RURAL of December 19th, 1885. Having personally visited the place some years ago, we knew the statements therein were misleading, and the screed went into the waste-paper basket. We have received several other letters of remonstrance, contradiction and explanation, about the eight other widely-advertised Florida land frauds, exposed and denounced in the Eye-opener of November 28th, last. The list given in both these issues contains the names of nearly all the places about which several papers have since made such a hubbub. The RURAL NEW-YORKER was the very first paper to expose those rascally swindles. Now for a few brief words with regard to the "paper towns," and imaginary "orange groves" widely advertised in many of our most prominent papers, and through the mails. Most of the "reclaimed" Diston swamp land in Polk, Hillsboro and Manatee Counties is, and will be for years, unfit for settlement. In these counties there are nearly 700,000 acres; but the other 3,300,000 acres which the concern was allowed to select, according to its contract with the State in 1881, are located in 12 other counties, and almost the whole is unsuitable for occupation, especially by Northern people. It is wet, swampy, under water in rainy weather, and the little dry land is sandy and barren and malaria is unavoidable in most places in Summer and Fall. No one should invest a dollar in any of this land, until he has thoroughly examined the exact location, either personally or through a reliable and competent friend. The companies now controlling the land are the Florida Land and Improvement Company, the Atlantic and Gulf Coast Canal and Okeechobee Land Company, and the Kissimee Land Company.

Sarasota Bay is the wretched hole described in the Eye-opener of December 19. Many of the 250 or more Scotch settlers, who were induced to immigrate to the place a few weeks ago, have returned in disgust to this city, and their accounts of the swindle transcend our account of the place. Others, whose money gave out, are forced to remain there still, while a considerable number have settled in Georgia and Alabama, having already had enough of Florida. Palma Sola is a beautiful place on paper, but is a miserable, unhealthy, God-forsaken, barren spot in reality, and the Palma Sola Land Company, which claims to own 13,000 acres, is a fraud of the worst kind in its presentation of the advantages, attractions and nature of the place. . . . St. Andrew's Bay is another fraudulently puffed up place—a nice, populous place on paper—a miserable hole in reality.

The other places dishonestly represented are Marion City, Grant Park, Parkersburg, Parkersville and DeWitt; Belmore City, Silver Springs Park and Bertram. We shall have more to say of Florida land frauds hereafter.

For Women.

CONDUCTED BY MISS RAY CLARK.

NURSERY SONG.

Go to sleep my baby dear—
God, the Father, now is near.
Close those heavy eye-lids, close,
Rest, in heavenly repose.

In the heavens, to and fro,
Fly the angels, white as snow.
They their watchful eye still keep,
While my little baby sleeps.

Seraphs bright and seraphs blest!
Calm my little babe to rest;
Then within its little bed
Love will hover o'er its head.

All without is white with snow,
And the storm winds fiercely blow.
But the God of love still keeps
My little baby while he sleeps.

ETTA POTTER.

SKETCHES OF GERMAN LIFE.

BERTHA A. ZEDI WINKLER.

COUNT AND PEASANT.

THE village nobility generally consists of a Count or a Baron and his family. When not of sufficient political importance to be considered necessary at the seat of government, or to hold a coloneley in the army, he is superintendent of the forests that surround his birth-place. Strictly speaking, he is the king's forester and game-keeper in the domains once owned absolute by his own ancestors. But that humiliating fact does not make him one whit less of a nobleman, either in his own eyes or in those of the peasantry. The vicissitudes of the rolling ages, and the destruction they surely work for certain worn-out institutions, classes of men or of creeds, seem to have made him more of a stoic gazing into the eye of inevitable fate, with the proud silence becoming the heir of yonder historic ruin, whose battlements have bid defiance to many a siege and battle-storm, only to succumb to time and the leveling hand of civilization.

Such, at least, was the bearing of the particular nobleman I have still vividly in my memory. A proud, prime old man he was. His erect figure, his military step, his iron-gray moustache, and his perpetual frown, scarcely lessening as he returned the salute of a passer-by, was in perfect keeping with his spare words and his reputation of being an "iron man." He was the village notability. Pastor, burgo-master, school-master and beadle together, could not create the stir that greeted the ap

pearance of the Count. Perhaps much of this importance was owing to his superior jurisdiction. He not only enforced the game and forest laws, which were the ones most frequently violated, but in serious, complicated cases of misdemeanor, he was always called by the village council to act as juror and judge. But besides all this, his own personality, his ancestral prestige and his history had much to do with inspiring the people with feelings of curiosity and awe which they had for no other person.

With his personality we are somewhat acquainted. His ancestral prestige consisted of the fact that his grandfather's castle was once the head-quarters of the great General Blucher, and of the current superstition that the ghost of this illustrious grandfather still rode around the village at night to see, as he did during his life-time, that all the soldiers of Blucher were well quartered with the peasantry. Of the present Count's history nothing is certain except that he was once in high favor with the King, and lived at court with his gay wife and beautiful daughter until he suddenly got transferred to his ancestral country seat with the small dignity and income of a forester. It has ever since been surmised and whispered that the Count must have incurred the King's displeasure by some over-bold opinions and expressions. That alone could account for his silence, the gloom of his residence, and the religious tendency of the young countess, who happily, they thought, was thus early turned from the vanity and unstability of the world. At all events, the charm of mystery and a pathetic interpretation of it surrounded the Count and his family. And though the peasants did not take kindly to him and his stringent rule, he was still a rare, fascinating personage, his daughter was worshipped by the children and his residence was the great center to which all interest, curiosity and gossip gravitated.

This residence was far from being a castle, however. It was situated at the foot of the mountain on which stood the ruin of his ancestor's castle, and was a simple, three-story, double mansion, fronted by a row of tall poplars. On one side was the stable, on the other the garden, and from the rear of the house one could look to the mountain's top and see all that remained of the family's ancient power and grandeur. And, indeed, even the ruins frowned fiercely and were picturesque in their desolation.

To the peasantry, this modest and modern mansion of the Count's was nevertheless a grand edifice. Nobody else's house had such an environment of gardens and well-kept lawns, and nowhere was there such an air of cold, aristocratic reserve. For this reason, everything looked greater and grander. Now, whether it was curiosity or the need of scraping in money wherever possible, or both, every delicacy that the peasants raised in the way of fruit, such as apricots or fine clusters of certain grapes, in fact, anything that they considered too good for themselves was quickly taken to the Count's residence, and considered amply paid for with a few pennies and the privilege of taking a hurried look at the interior of the house while they were waiting for the house keeper's appearance. Sometimes the old Countess herself would appear, and drive a sharp bargain with her gracious smiles and her easy way of offering next to nothing for something the peasant had made up his mind to demand his own price.

One day a peasant girl was reprimanded by her parents for bringing home an exceedingly small sum of money for a pair of young roosters that she was told to take to the Count's house, when she burst out triumphantly, "Well, didn't I see the whole house inside!—the Countess' bed-chamber, the kitchen, the cellar, and the pantry, everything all over!"

As that was a privilege never yet accorded to any of the peasants, the family crowded around to hear how she managed it.

"Well," she began, her eyes sparkling with mischief and shrewdness, "when I found that the Countess wouldn't give me any more than three shillings for my roosters I just thought to myself I'll make them roosters show me those grand rooms, anyhow. So, while I took the money in one hand I let the roosters, kind o', as if I couldn't help it, fly out o' my other hand. Well, you ought to have heard the racket they made, fluttering and cackling from one room to another and I scrambling after 'em and taking in everything with my eyes but the roosters. I thought it was time to take them in when I had seen everything else. The Countess was most frantic for fear the chickens might break something, and skipped from one side to another with her skirts pulled together as if she was afraid of them picking her to pieces. The young Countess laughed and tried to look angry at me at the same time. But I just thought I was in for it once, and was bound to get the worth of those roosters in sight-seeing. So I chased them from one room to another till I had seen every one. Then I caught them in no time and handed them to the Countess, who praised me for being so deft as to catch the vicious things before they broke any of her valuable china. Oh, I'm smart enough when I want to be!" was her final exclamation, and we thought so too when we heard it.

In my next I will give an account of the young Countess and the Sunday-school which she started in that village.

DOMESTIC HAPPINESS *vs.* DOMESTIC UNHAPPINESS.

"Mother," "Home" and "Heaven," are to us the sweetest, the most beautiful words in the world. The first two are associated with and inseparable from domestic life. The fact must be conceded, and cannot be too often or too strongly emphasized that the higher forms of domestic happiness are the nearest approach to heaven attainable in this world. This being true, the subject ought not to be taken up hastily or dismissed without careful and mature deliberation. Our Saviour continually recognized this, and the bride and bridegroom were terms used by him to express the embodiments of the highest forms of perfection and happiness.

If domestic happiness is the perfection of earthly joy, then its attainment is surely worthy of our serious consideration and most earnest endeavor. It is often urged that heaven would not be a place of enjoyment to a person whose whole life had been antagonistic to heavenly things. So it is with domestic life. A young lady whose entire life has been devoted to the acquirement of the so-called æsthetic accomplishments—accomplishments which are essentially public in their character, cannot be suited to the duties of domestic life, duties which are and ought to be essentially private in their character. I do not mean that isolation conduces to domestic happiness, but that success in domestic life requires an undivided interest in and consecration to home and home duties. In recent articles I have given some of the reasons why married life is no longer looked upon as a desideratum by young people of either sex.

An (to me) unknown writer has given as another reason this: "The lack of business-training in woman." I know that a woman will spend a day in what is called "shopping" and finally buy what she does not want, and will spend an hour or more getting ready to catch a train, only to miss it after all. Having had the morning hours before church time, to prepare for the service, she will be five or twenty minutes late. The word of the butcher or baker are accepted by them, when they themselves should be the judge. Salesmen in any dry goods house, especially at the "bargain counter," can testify to the truth of this statement. The author above quoted from, also says:

"It should be the aim of all to give the girls just as broad a business education as the boys. It makes them capable of taking care of the family, if such responsibilities are placed upon them; it broadens their ideas and makes them nobler and better. Girls, as a rule, are fully as clear-headed as boys when young, but if, as is the common practice, the girls are brought up to do nothing, to think but little except of dress and amusements, they fall far behind the young man, at the age of 20, in mental ability.

"What is needed is, that at home and at school, they be taught that to shine in social circles or to roll in wealth is not the highest aim of womanhood. But let them be taught to make a home joyful and happy, and yet be prepared, if necessary, for life's bitterest struggles. The young woman who is best equipped for life's battles is the one who has been brought up to see and know something of the shadows as well as the sunshine of everyday life; who knows what poverty is, what work is and what true happiness is. No person, whether man or woman, can be truly happy with nothing but idleness on hand, and girls should be educated that work of some kind is necessary to health and happiness. Give girls life's practical lessons—lessons that once learned are never forgotten. Let them understand thoroughly the details of everyday life, the value of all kinds of commodities used daily, how to make a check, draft, note and receipt. Let them be told the truth about themselves and about the world. They should know something about the snares and pitfalls that beset them. Let them be thoroughly impressed with the fact that on themselves, in a large degree, depends the success of the men they marry. Let them know how to cook, giving them a thorough course in the kitchen. Let them begin where their mothers left off, and we shall have a generation of girls strong, hopeful, ambitious and self-reliant, that will elevate the men, and make a hardier and more aggressive people, and thousands of firesides happier and better."

J. H. G.

SWEEPINGS.

Said a young mother to me not long since, after seeing her little girl safe into dreamland, "I often have a lonely hour when resting at night, wondering whether I have dealt fairly by my child through the day, whether I have been patient and forbearing enough, whether I have chided too much, or let her own way lead her too far, for our future happiness together."

How the words touched me, and they could not fail to reach any mother's heart. The day is so busy, so full of thought and care, that we sometimes put off the little requests, the demands on our time and patience, and it is only after we have time to think, that the pleading eyes seem so eloquent, the soft, red lips so tremulous over some little disappointment (great to them), that a pang of remorse strikes us as a blow, and gazing into the dear little sleeping face, with tear-blinded eyes, do we make new resolutions, and ask fervently for strength and wisdom to guide the plastic minds aright, realizing how solemn and weighty a responsibility is resting upon us. A mother who had suffered from misdoings of a child, once said to me: "You do not think now that your innocent baby can ever cause your heart other than throbs of pride and joy. I trust she never will, but after all, my prayers and teachings, which I bestowed tearfully and to the best of my knowledge, that I might see good results, have been for naught. I am often of the mind that we know not what we have given us, a blank or a prize."

ETTA.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

HOME DRESSMAKING.

E. L. TAPLIN.

It is a noticeable fact that the average fashion column, bright and entertaining though it may be, is of no earthly use to most farmers' wives and daughters, who wish to attire themselves becomingly and in accordance with the mode, without other help than their own deft fingers. However, the present styles lend themselves readily to small purses, since extreme simplicity of design is effected in most woolen gowns; the beauty of the garment depends entirely on its perfect fit and grace of draping. The most popular models this Winter are made of two kinds of woolen goods, one smooth-faced—homespun or ladies' cloth; the other with a rough surface—astrachan or bouclé cloth. They should both be precisely alike in color. The material required will be two yards of the rough cloth and six of the smooth, unless a jacket is required; the latter would take two yards of the rough cloth.

Having cut the cambric lining for the skirt, face up the right side six inches deep with the plain goods, and the wrong side with canvas or glazed diagonal 12 inches deep; then over the canvas put black alpaca four inches deep, and bind with dress braid. The alpaca prevents dust from clinging to the skirt. Next, make a pleating for the front and side breadths; the back is left plain. This will require four breadths of plain goods, three six inches deep and one 20 inches. Cut the deep piece into halves, t en join first a six-inch piece, then the deep alternately; hem the bottom and make into side pleating, the pleats turning towards the front. The deep pleating should come over the seams in the skirt. Then cut three front breadths of the rough goods about four inches shorter than the foundation, line with crinoline, face about an inch deep around the bottom and front of the side breadths, first sloping them at the bottom for about 15 inches, so that they will show the deeper pleating at the seams. Lay these breadths on the foundation, first the front, taking care that it is accurately fitted, then the sides, bringing them well over the front. The breadths should be apparently fastened together on each seam by three large clasps, the lowest one placed at the head of the slash, showing the pleats. For the back breadth, take a breadth and a half of the goods, and make it into two triple box-pleats, which must come to within 12 inches of the top of the skirt; above this make a puff, which requires one breadth 27 inches deep. Pleat this across the top of the box-pleats and into the side seams. Draw up the surplus cloth in the middle, and tack to one side of the placket. Pleat it into the belt at the top, excepting about 18 inches in the middle, which should be hemmed across the top, pleated vertically in the center, and a hook put under the pleats, catching into an eye on the end of the belt. The grace of the puffy draping depends on the taste of the maker. Tapes will be required to hold the skirt in place.

The basque must be short; a pretty shape is square in front, sloped high over the hips, with short-tailed back. Cuffs, collar and vest of the rough goods may be used, and the metal buttons should match the clasps on the skirt. A little bonnet shape, with high horse-shoe crown, may be covered with the rough goods, edged with a single row of beads of corresponding color, and trimmed only with an erect, many-looped bow of bright ribbon, canary or orange being the favorite tints. The popular ribbon this Winter is what our grandmothers called "purl-edged," having little loops along it like feather-edge braid. A swallow-tailed bow or cluster of loops of this ribbon is much worn, pinned to the left side of the high collar.

If a jacket is required, to match the gown described above, get a pattern with loose front and tight-fitting back; trim it with very large metal buttons, and, if additional decoration is required, the military cords, which loop under the arm and across the chest, are very jaunty and handsome. A little muff may be made of the rough goods, trimmed with a bow to match the bonnet. The leading color for cloth gowns this Winter is brown in varying shades; dark greens and blues rank next. Garnet is little worn, except in children's frocks.

A WEEK'S WORK AT MRS. HOMESPUN'S.

AUNT RACHEL.

TUESDAY.

While her breakfast was cooking Tuesday morning, Mrs. H. proceeded to put her bread into the pans, that it might be ready for the oven when breakfast was over.

"It saves so much time," she remarked, "to mix the sponge up ready to be made into loaves, and let it rise over-night."

Breakfast over, she produced the tin pail in which the children carried their lunch to school, and placed in it slices of bread and butter, with cold meat, and some wholesome-looking brown doughnuts and apples, and soon three merry, rosy-cheeked children had started for school.

Then, having put her bread into the oven, Mrs. H. made a

STOVE-PIPE PUDDING,

which was to be put in the steamer at nine o'clock to steam until dinner-time. The directions for the pudding were as follows: One cup of molasses, one of sour milk, a small piece of butter, melted, a quarter of a teaspoonful of cinnamon, cloves and allspice,

one cup of chopped raisins rubbed into a pint of flour, two eggs well beaten together; then add flour and raisins, and one teaspoonful of soda and a teaspoonful of salt and enough more flour to make a stiff batter. Steam three hours. To be eaten with pudding sauce or cream and sugar, as the taste dictates. "This is the most convenient pudding in the world," said she, as she placed it in the pan, "for you can make it serve for two days as well as one."

"The second day slice the remainder, lay it on a plate and steam it five or ten minutes before wanted, and it will be as good as new. It is also nice to make on Saturday, and then the dessert is already prepared for Sunday." The color, she said, was supposed to give the pudding its name."

She then made apple pies and cookies that they might be ready to go at once into the oven when the bread was done. She always intends to do as much cooking as possible on Tuesday, as she thinks Wednesday morning the best time to have the ironing done. In an hour the loaves were laid away in the pantry, and while the other cookery was being baked she brought in a spare-rib, placed it in the dripping-pan, sprinkled a little salt and powdered sage over it, put in a teacup of water, and when the last pie was taken from the oven, the meat was placed in it that it might be baked for dinner. And with baked potatoes this meal was easily prepared, and, although unexpected company came in, no extra work was required of the hospitable mistress. After dinner, while the helpful daughter put the kitchen in order, a dripping-pan of coffee was put in the oven to be roasted, and as Mrs. Homespun cut out some garments to make, she watched and stirred it frequently until, when a little was ground in the coffee mill, it had the right color and brittleness to suit her practiced judgment. It was then removed from the oven, a tablespoon of butter was stirred in it, and when nearly cool a fresh egg, well beaten, was stirred in and the coffee set by the fire to dry, before being put away in a tight drawer. A quiet, busy afternoon followed until the supper hour, and the hungry school children arrived at the same time.

Soon the whole family were summoned to the evening meal, where, with cheerful chattering, the children disposed of the remains of the baked spare-rib, supplemented with brown bread and butter and canned Siberian crab-apples, with a relish which was very complimentary to the cook. All but the tireless housewife devoted the evening to reading, but she sat beside a basket of stockings, whose dilapidated heels seemed to forbid such recreation, but she cheerfully took up the burden.

A FEBRUARY FARM BREAKFAST.

THIN slices of cold, boiled ham; eggs poached and dressed with plenty of butter and a little salt (no pepper). Place cold boiled potatoes, chopped fine, seasoned with salt and a trifle of pepper, over the fire; add half pint of water for each quart of potatoes, cover and cook fast for a few minutes without stirring; then add a good spoonful of gravy from the ham for each quart of potatoes and cook fast, stirring constantly, and dish up immediately. If fried potatoes are set back and allowed to cool a little, they become leathery. Graham gems and one kind of fruit sauce can be added at one's pleasure, with coffee and hot milk. No butter on the table separate from the food.

AUNT NINA.

DOMESTIC RECIPES.

PIES.

IT may seem presumptions in a Kentucky woman to tell the dwellers of pie land anything concerning pies. Yet so many remedies appear to keep pies from "boiling over," that I wonder the pies continue to do so. While I cannot lay claim to having been brought up on them, yet I've seen enough to know what they are, and my experience with them has been in every way satisfactory. After rolling out the under crust, before trimming it off, place in the fruit, then place top crust on, and with both hands press the two together as you slip the pie around. Next take a fork and press the edges all round and prick the upper crust. Place in a moderate oven. Never let the crust brown. Have it, when done, a flaky white. When the edge of the crust leaves the pan, and your best judgment says "'tis done," with a knife slip off the pie upon a plate. Will it always slide? Yes, if the pan is slightly greased and the pie properly baked. Such pies are not to be regarded with contempt. They have a place in the heart of man and boy, that nothing else fills so well.

I remember asking a "wearer of the gray" how he captured a squad of soldiers? He laughed, saying, "We were camped on a river, 'they' were just across; our 'boys' placed pies along the river bank and that brought them when nothing else would. While they ate the pies we surrounded and captured."

WATER INSTEAD OF MILK IN CAKE.

HEARING that a confectioner had said: "Water is much better than milk in cake, but you can't convince a woman that it is true," I began to use it, having a mind open to convictions, and the result left no doubt as to his being right about the water in the cake, though altogether wrong as regards the woman. For the past year in all cake recipes calling for *milk*, I have substituted water, using cream-of-tartar and soda, or baking powder.

A milk crock is very nice for cooking oatmeal, custard, hominy or fruit, in fact, anything requiring careful cooking.

Its cheapness and it being easily cleaned commends it.

In baking thin cakes to be placed one on the other, to have them come out nicely, loosen the edge with a knife, trim the cake down on a cloth, then lay a wet cloth all over the bottom of the pan. The cake will drop out.

TEA CAKES.

NICE tea cakes are made with one egg, two cups of sugar, one cup of sweet cream, one cup of butter, teaspoonful of soda, two teaspoonfuls of cream-of-tartar. Season with nutmeg. Enough flour for a soft dough. Roll thin and cut in fancy shapes.

SOUTHERN PUDDING.

THREE eggs beaten separately, two cups of white sugar, one cup of sweet cream, one cup of butter, two or three tablespoonfuls of flour. Flavor with lemon and bake in crust. Will make three puddings. M. L. S.

CORRECTION FOR FRUIT CAKE.

IN issue of January 2d, two pounds of butter and one-and-one-half pound of lard should have been one pound of butter and one-half pound of lard. S. M. T.

CUSTARD PUDDING.

One quart of new milk, yolks of six eggs, one cup of sugar, one tablespoonful of corn starch; flavor with vanilla. When cold beat the whites to a stiff froth, add one-half cup of sugar, spread on the top and brown in the oven.

SUET PUDDING.

One cup of molasses, one of chopped suet, one cup of raisins, one of sweet milk, one teaspoonful of soda; flavor with cinnamon and cloves. Steam three hours.

VIRGINIA PUDDING.

One quart of scalded milk, two tablespoonfuls of flour in a little milk, yelks of four eggs, the whites of two, and a little salt. Bake one half hour. When cold beat whites of two eggs to a froth, add a cup of sugar and juice of a lemon. Pour over the pudding.

MRS. B. C. D.

SPONGE CAKE. NO. 1.

Mix one cup of flour and two heaping teaspoonfuls of baking powder together. To one cup of sugar add three beaten eggs, two teaspoonfuls of milk, a pinch of salt. Stir all briskly together and bake at once.

NO. 2.

Three eggs well beaten, one cup of sugar, two cups of flour, three-fourths of a cup of cream, two teaspoonfuls of cream-of-tartar, one teaspoonful of soda and a pinch of salt.

DELICIOUS WHITE CAKE.

One cup of sugar, one cup of sweet milk, one-half cup of butter, two cups of flour, two teaspoonfuls baking powder, whites of three eggs beaten very stiff and added last thing.

OSTING.

One cup of sugar, white of one egg, one tablespoonful of water. Boil sugar and water together, take from stove and add the beaten egg while hot. MRS. S. B. EATON.

SALVE.

One tablespoonful of lard, a piece of shoemaker's wax, the size of a hickory-nut, the same quantity of bees-wax and three tablespoonfuls of flaxseed oil. Melt all together and put in a box. It will keep for years. This is known at our house as "Grandpa's salve." Nothing can equal it for sores that have dirt in them.

STARCHING.

I tried the way May Maple gave for starching shirts and have not been successful. The shirts did not get as stiff as they should and were far from being as good as laundry work. I followed her directions carefully. My way of starching with "elastic starch" looks better and does not take nearly so long. If any of the RURAL readers have tried May Maple's process, will they please report, as I am anxious to learn if I am at fault. HARRIET BROWN.

[Will Harriet Brown please tell us what "elastic starch" is?—E. M.]

GARDEN SEEDS FREE!!

Everyone knows that NORTHERN GROWN SEEDS produce finer, earlier and larger Vegetables than any others. We have bought 65,000 $1.00 lots of Garden and Flower Seeds, grown in Minnesota and Dakota, right under the North Star, and want you to try them. We publish THE HOUSEKEEPER, 85,000 circulation and in its ninth year ("no chicken," you see). We are ambitious to bring this Home Paper up to 150,000 circulation. Hence the offers we make you:

1st OFFER—THE HOUSEKEEPER is a monthly, $1.00 per year. If you send your subscription for 1886 and $1.00, we will send you $1.00 worth of garden or flower seeds. For every two additional subscriptions secured by you at $1.00, we will send you $1.00 in seeds as above, and will also send $1.00 in seeds to each subscriber secured.

2d.—If you send your subscription to THE HOUSEKEEPER for 6 months at 50 cents, we will send 50 cts. in seeds as above. For each two subscriptions for 8 months secured by you at 50 cents we will send 50 cents' worth of seeds as above, and same amount to each subscriber

3d.—To any lady who sends her address for a specimen copy (free) of THE HOUSEKEEPER, and 6 cents postage, we will send a 25 cent (retail price) packet of the new and beautiful Giant Pansy (imported Trimardeau, flowers 2½ to 3 inches in diameter).

On receipt of subscriptions, we mail catalogue of the well-known seedsmen Northrup, Braslan & Co., Minneapolis, Minn., with an order for amount due in seeds, which order will be filled immediately when sent with your selection, to Northrup, Braslan & Co. *The leading specialties of this catalogue will be advertised in March Housekeeper and selections may be made from that list by all subscribers.* Address BUCKEYE PUB. CO., Minneapolis, Minn.

☞THIS OFFER WILL NOT APPEAR AGAIN.

News of the Week.

HOME NEWS.

SATURDAY, Feb. 6, 1886.

MRS. BAYARD, wife of the Secretary of State, died last Sunday morning at Washington. The sudden, accidental death of her oldest daughter two weeks before was a blow from which she never recovered. The Secretary's double grief is sadly tragic.....The Pillsbury flouring mills at Minneapolis divided $35,000 surplus profits among 1,100 employees last year.....English holders of Confederate bonds have retained ex-Judge Fullerton of this city as counsel, and are going to force the United States to pay the bonds!!!.....Gen. Hazen, of the Signal Service, seems to have a special faculty for quarreling with his superiors, bullying his subordinates, and in his reports, etc., furnishing fun for the newspapers. Charges are now made by the Treasury Department that money has been spent extravagantly and illegally by his Bureau, which Gen. Sheridan says is of no earthly use to the army, and should be made a civil, instead of a military institution. Let it be attached to the Dep't of Agriculture and furnish frequent and trustworthy weather reports to our farmer friends!.....Dr. Shrady, editor of the Medical Record, laughs at the recent hydrophobia scare, and says there have been only three genuine cases of hydrophobia in the United States in 10 years! How the world or somebody on it is given to lying!.....It is estimated that the receipts of the 10,000 saloons of New York city average $220,000 a day, or about $74,000,000 annually. Judge Brewer, of the U. S. Circuit court in Kansas, has elaborately decided that no State can, by legislation or by constitutional amendment, prohibit the liquor traffic without paying for the private property thereby destroyed or injured. The case is to go to the U. S. Supreme Court, where it cannot be reached under three years!.....The United States Government is the greatest printer and publisher in the world. The number of publications issued annually amounts to about 2,500,000, of which about 600,000 are bound volumes.....In Warsaw, Ind., Barney Card has been arrested for forging notes to the amount of $30,000. He secured $8,000 from farmers whose names were obtained by tearing the signatures from the assessment blanks in the county auditor's office.....Geronimo, the bloody Apache renegade, together with his infamous band, has surrendered to Lieut. Mans. Careful estimates place the number killed by these fiends during their last raid at 170. Many of these were women, some of whom were highly refined and connected. A great number of the men were barbarously tortured and mutilated. Most of the women were inhumanly outraged, and fiendishly tortured and mutilated. The savages expect to be treated kindly like so many similar devilish raiders, and to be fed and petted at the San Carlos Reservation. They have already been comfortably clothed, well fed and cared for. In Arizona and New Mexico, the scenes of their atrocities, there is a fierce demand that the wretches shall be promptly hanged, and the Government is urgently pressed for vengeance on the monsters.....George L. Lorillard, well known, like his brother Pierre, as a great patron of the turf, died last Wednesday at Nice, France, where he was passing the Winter. He had for years been a victim of inflammatory rheumatism, and his death had previously been three times expected.....It appears probable that the killing of the brave Indian fighter Capt. Crawford, who had fairly hunted Geronimo to bay, was due to a blunder. The War Department believes he and his company were mistaken for hostile Indians, all reports of treachery, etc., etc., to the contrary notwithstanding.....A suit is being prepared by Solicitor-General Goode, at Washington, to try the validity of the Bell telephone patents. The papers are full of scandal about Attorney-General Garland's connection with the case, as he owns $1,000,000 worth of stock of the Pan-Electric Company, a rival organization, the stock of which was presented to him gratis while in the United States Senate. Secretary Lamar is also besmirched, as so many high officials in his Department own stock in the same company, which was also presented to them gratis. The whole business has an unhealthy look morally—but the fact remains that the Bell Company is an odious, extortionate and dishonest monopoly, the overthrow of which is demanded for the public welfare.....As the time for the meeting of the Canadian Parliament approaches it becomes more apparent that the death of Riel cannot be used as a political factor to build a party upon. The race feeling will make trouble, and the Conservatives will be forced into making concessions to the French element—such as they have never before been willing to make: but there is no organizing hand in the opposition to make a cry of free trade, administrative reform and justice to the half-breeds effective in politics.....The President has, at the request of the Secretary of the Interior, issued an executive order withdrawing 360 square miles of land surrounding Crater Lake, in Oregon, from settlement and public sale, pending legislation looking to the creation from these lands of a national public park.....The Mallory steamship company has again been placed under boycott at Galveston by an order issued last week by the executive committee of the Knights of Labor of Texas. The present trouble was practically caused by the company's refusal to discharge the new men and employ the November strikers in their places.....Manager Oakes, of the Northern Pacific Railroad, says negotiations are pending for the sale of all the lands east of the Missouri at Bismarck, amounting to about 4,000,000 acres, for $10,000,000 of the preferred stock.....The Pennsylvania Railroad and its allied companies is to establish a relief department on the plan so successfully operated by the Baltimore & Ohio. The members will be assessed on a scale according to their pay. The fund will be used to pay accident benefits, sick benefits and an insurance at death. The men, however, object to the plan, and even threaten to strike if it is enforced, as they say it is simply a scheme to reduce their wages by forcing them to insure against accidents on the road, so as to lessen the liability of the company for damages.....From the action and discussions of Congress so far, it is very evident that a reciprocity treaty with Canada is out of the question for the present. Even the President's suggestion of a Commission to consider the matter of fishing rights, meets with no support. The representatives of the New England fisheries, who oppose the free admission of Canadian fish, have monopolized attention. If the advocates of reciprocity were half as active as its opponents, the facts and arguments before Congress would not be so one-sided. The friends of the treaty are letting the case go by default.....

For a full illustrated Description of our Free Seed Distribution for 1886, examine the Nov. 14 issue. Preserve it for future reference. It is sent to all applicants for specimen copies. It also contains a list of the

$3,300

worth of Presents offered to those who send us clubs. This is distinct from the Rural's regular Premium-list.

AGRICULTURAL NEWS.

SATURDAY, February 6, 1886.

THE vintage of 1885 in Europe was the smallest harvested in many years. We shall have an abundant supply of French wines, however, as long as the California vineyards hold out.....The merchants of Buffalo are trying to have the New York State Fair located at that city this year. A suitable site can be secured for from $10,000 to $20,000—"a trifle compared with the benefits to be reaped by the city."....The Texas Oklahoma Homestead Colony, Denison, Texas, is inviting membership at a fee of $3 each, and making big promises of securing fine homesteads for each "as soon as a land office is established there." Land Commissioner Sparks says: "I have a very positive opinion that no benefits can be derived from a membership in the alleged 'colony.'" Land fraud sharpers are not all engaged exclusively in Florida land swindles.....The National Cane Growers' Association (successor to the Mississippi Valley Cane Growers' Association) has been in session in St. Louis since Thursday morning.....The Marquis de Mores thinks of exporting "frames" of lean young stock to France to be there fattened by the farmers. This has at times been quite a trade with Scotland. Mores says he can land the stock in France for $50 a head, and that when fattened they will there be worth $130.....The census of Nebraska shows that the population, from 1880 to 1885, increased from 452,433 to 350,645, over 50 per cent. The number of farms increased 58 per cent. The acreage under cultivation has just doubled. The value of farms grew from $105,000,000 to $289,000,000; value of live stock from $33,000,000 to $83,000,000. Wheat shows no increase, but other grains show from 200 to 500 per cent. The manufactured products increased from $12,000,000 to $43,000,000. In all material points the growth in wealth and facilities has outrun the increase in population.....A proposition is before the House Committee on Agriculture advocating the extension of the Signal Service system generally to the country districts. It is proposed to make every telegraph office a signal station for the display of weather predictions to be indicated by lanterns at night and flags in the day-time. It is estimated the cost of the plant will be $25,000, and the annual expenditure after its establishment would be $250,000.....

THE MICROSCOPE raised the standard of Thatcher's Orange Butter Color until three eminent experts in New York State reported good enough.—*Adv.*

Crops & Markets.

SATURDAY, Feb. 6, 1886.

Low prices of grain, high railroad freights and extremely cold weather have made things dull during the week in the Northwest. Eastern shipments are excessively dull. The total shipments of flour, grain and provisions east from Chicago during last week amounted to only 25,000 tons against 85,000 for the corresponding week last year—and business was then considered dull. Lately, only 18 carloads of corn were received at Chicago in one day, against 300 on the corresponding day last year; but receipts are now about 250 carloads a day. All through the more Northwestern States, however, shipments are unusually light. Besides the above causes, the great snow blockade of country roads and railroads impedes shipments. In many sections 20 per cent. of the corn is still under the snow; in many others, especially in Nebraska farmers are burning corn for lack of coal and wood. The impression is growing stronger that the Agricultural Department's estimate of the crop was too high as regards both quantity and quality. Anywhere in Illinois, Iowa, Missouri, Ohio and Indiana, corn to-day is bringing paying prices; but farmers are not selling freely, and as seeding commences in March in Illinois, Iowa and Nebraska, farmers won't have much time to ship their surplus corn. A great general reduction of freight rates is likely, however, or else the railroads will cut rates clandestinely.

The condition of the winter wheat varies. There are from 12 to 14 inches of snow in Northern and Central Illinois; from 18 to 24 in Wisconsin, and about the same in Minnesota and Nebraska. In Missouri and Kansas the depth varies greatly. In nearly all States, however, there are considerable areas in which the crop is only partially covered, and elsewhere the ground is quite bare of snow and covered with ice; but on the whole, the crop is safely blanketed north of the Ohio; south of that river the ground was generally bare before last Wednesday's widespread snow storm; later advices do not say whether the snow that then fell nearly all over the South from the line of Northern Texas, has remained on the ground—probably not in most places.

Immense damage has been done to the wheat crop of California by freshets in the San Joaquin Valley and near Stockton, while 25,000 acres of growing wheat have been ruined by the breaking of the levees on Robert's Island. Most of the island is owned by the Glasgow-California Land Company, composed principally of foreign capitalists, who lose $600,000 by the inundation.....A sleet storm has ruined many orchards and groves in New Hampshire. At Nottingham, one man lost 1,000 peach trees....Of all the States in the Union, the recent frosts have done the most damage in Florida, in proportion to the value of horticultural and pomological products. The cold was almost unprecedentedly severe, and extended over the entire Peninsula, except the southern point, on which little is cultivated. A great number of the bearing orange trees were either damaged or entirely ruined, while the loss in fruit alone is estimated at fully $1,000,000. In the young orange groves, a large proportion of the trees were ruined entirely, and nearly all the rest greatly injured. Garden truck, a great deal of which is grown in the State, was much damaged or wholly destroyed. As usual, some reports say the damage was not very great and will not be permanent. The rosiest reports come from natives, the gloomiest from Northern settlers. The warning from the Weather Bureau that the "cold wave" was coming, caused many to pick their fruit at once, working day and night, and thus saving much money. At Jacksonville, the thermometer registered 12° above zero; in 1835—the year of the greatest Florida frost—it registered 8° above zero. Then the cold lasted three days; lately, only one. The havoc now is considerably less disastrous than it was then.....

Special crop reports to the American Rural Home, of Rochester, N. Y., from all the wheat growing regions indicate that the plants are well covered with snow, and all in good condition in that respect for a large crop. Thousands of acres of wheat land in Dakota, however, will be fallow this Summer, to correct foulness and weediness.....

The terrible cold of the past week has added to the fears of the Western cattlemen. In many parts of the country the roads are completely blockaded, and the movement of agricultural products and stock on the way to market has been much impeded or entirely hindered. The railroads, too, in many States, and especially in the West, have been seriously hampered by snowdrifts. The wheat markets early in the week dropped everywhere, owing chiefly to the throwing of a large amount of "long" wheat on the market and the continued unwillingness of Europe to buy at our figures. Later, prices went up, owing to increased export demand, and the action of a "bullish" crowd in Chicago.

It is now possible that the heaviest run of hogs to market is over, and that the shipments for the rest of the season will be lighter. Farmers are a trifle discouraged by the low price of hogs, and the widespread fatality of disease. Kansas alone has lost $4,000,000 directly from hog cholera, to say nothing of the general depression which the swine industry has suffered in other ways from this plague.....The Cincinnati Price Current of Thursday says: The number of hogs packed in the West last week was 275,000, compared with 290,000 the corresponding time last year. The total to date since November (the beginning of the winter packing season) is 5,530,000, against 5,555,000 a year ago. The following indicates the movement at the principal points since November 1:

Chicago	2,175,000	Kansas City	558,000
Cincinnati	320,000	St. Louis	315,000
Milwaukee	280,000	Indianapolis	253,000
Cedar Rapids	167,000	Louisville	121,000
St. Joseph Mo.	116,000	Cleveland	63,000

The monthly average weight of hogs weighed at the Union Stock Yards, Chicago, for winter seasons, compare as follows:

	Nov.	Dec.	Jan.	Feb.	4 mos.
1885-86	250	249	252	...	...
1884-85	261	272	258	240	261
1883-84	247	253	242	218	243
1882-83	248	257	230	248	254
1881-82	262	268	252	229	255
1880-81	262	264	258	232	257
1879-80	264	264	265	266	265
878-79	278	277	279	236	268
877-78	265	270	280	270	272
876-77	269	267	253	257	262

The Indian corn market has been pretty steady, having advanced in some places and fallen behind in others. The visible-supply report shows a decline of nearly 400,000 bushels in the week. The relatively better export demand also continues.

Oats have been steady and closed here, for cash, last night at 38 cents, as against 37¾ one week ago, an advance of one-quarter cent. The visible supply report, New York Produce Exchange, does not indicate any change in the total quantity in sight.

For Throat Diseases and Coughs, —BROWN'S BRONCHIAL TROCHES, like all *really good* things, are frequently imitated. *The genuine are sold only in boxes.—Adv.*

MARKETS BY TELEGRAPH.

SATURDAY, February 6, 1885.

CHICAGO.—Compared with prices a week ago, "regular" wheat is 1½c. lower; No. 2 Spring, steady Corn, ⅝c. lower. Oats, 1½c. lower. Pork, 45c. higher; cattle higher on best sorts; somewhat lower on others. Hogs from 10c. to 25c. higher all round. Sheep, from 25c. to 50c. lower on poor sorts of all grades, and steady on higher or best grades.

WHEAT.—February, 87¾@79¾c; March, 74¾@80½c; May, 82¾@85¼c.; No. 2 Spring, at 82c.; No. 3 Spring, at 71¼c. CORN.—Firm and quiet; Cash, 36½c; February, 36@36¼c., March, 36½@36¾c; May, 40@40⅜c. BOSTON.—Compared with cash prices a week ago, corn is ½c. higher; oats, steady; hay and straw unchanged; butter, somewhat higher on all good sorts; cheese, steady; eggs, from 1c. to 1½c. lower; potatoes, steady.

GRAIN.—CORN.-Steamer Yellow, at 52@52½c; steamer mixed at 51c; and no grade at 49@50c, per bushel. OATS are steady. No. 2 white are generally held at 42@43c; No. 3 white at 41½c, and mixed at 40@42c per bushel. Small sales of Rye quoted at 61c, per bushel. BRAN is in fair demand and selling at $17 50@ $18 00 for Spring and $18 50 for Winter; fine feed and middlings at $18 00@21 00, and cotton seed meal at $25 00 on spot and $22 00 per ton to arrive. HAY AND STRAW—Hay in good demand and steady, $19@20 ₹ ton for choice and fancy; fair to good, $17@18; fine, $16@18; for poor and damaged, $13@15. Western choice $16@ 17 do fair to good $14@15. Rye straw is held at $19@20 50 for choice, and $12@14 for common to good. Swale hay, $11@12; Oat straw, $9@10 per ton. PRODUCE—The various articles under this head continue to command fair prices. BUTTER-Northern creamery, choice to extra 24@25c; good to choice summer, 18@23c; western creamery, 27@33c, for choice to extra; northern dairy, 22@23c, for Vermont extra; 18@20c, choice, and 12@16c, for fair to good; Western dairy, 18@21c, for choice, and 10@ 15c, for fair to good; imitation creamery at 15@25c, for good to extra; ladle-packed, at 18@20c, for choice. CHEESE—New York choice to extra, 9@10½c, and common to good, 5@8c; Vermont choice to extra, 8½@10c, and common, 5@7c; Western common to extra, at 4@9½c. Sage, extra, 11@12½c, good to choice, 8@10c. EGGS—Cape and near-by, per dozen, at 25c; Eastern extras, 33@21c; do, firsts, 22c; Northern, fresh, 22@ 23c; Western fresh, 22c; Provincial, 22@23c. BEANS— Choice Northern hand picked pea, at $1 60@1 70 per bushel; do, do, New York, $1 50@1 55; do, do, screened at $1 25@1 40; medium choice, at 1 50; do, screened, $1 25@1 40; Yellow Eyes, improved, at $1 60@1 65; do, choice flats, $1 50@1 55; Red Kidneys, $1 80. Canada peas, 85c@$1 00 per bushel for common to choice. Green peas, Northern, at 90c@$1 00; do, Western, $1 20 @1 25. Potatoes range at 60@80c, per bushel, as to quality.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, February 6, 1886.

STATE OF THE MARKET.—Compared with cash prices last week, flour is unchanged except Southern flour, which is 5c. to 10c. lower; wheat has dropped 1c. to 1¼c. on all grades; corn 1½c. to 1¾c. higher, oats unchanged; beans 5c. lower for Marrows; pork 12½c. higher; lard 1½c. to 2c. lower with dull trade; butter and cheese hardly steady for other than choice grades; poultry firmer with a slight increase; cotton unchanged; fruit unchanged; vegetables steady. The cold, stormy weather of the latter part of the week interfered somewhat with business; still the supplies of provisions brought in were fair. No sign of advance in the apple market yet. The grain market still bumps up and down with each day's business. The rise of 1c. to 1½c. on eggs was a surprise. It is not expected to continue. The trade in seed potatoes is lively. The tubers stored in canal boats are in good condition.

FLOUR, FEED AND MEAL. FLOUR—Quotations: Fine at $2,15@$2.85; Superfine, $2 75@3 25; Extra No. 2, $3 15@ 3 60; Good to Fancy Extra State, $3 60@4 25; Common to Good Extra Western at $3 15@4 00; Good to Choice Extra Western, $4 00@5 50; Common to Fair Extra Ohio, $3 15@3 75; Good, $3 80@4 20; Good to Choice, $4 25@5 25; Common Extra Minnesota, $3 15@ 3 65; Clear, $4 10@4 50; Rye Mixture, $4 00@4 25; Straight, $4 50@5 00; Patent, $4 75@5 50; Bakers' Extra, $4 10@4 75; St. Louis Common to Fair Extra, $3 15@ 3 80; Fair to Good, $3 85@4 75; Good to Very Choice, $4 80@5 50; Patent Winter Wheat Extra, $4 50@5 55; City Mill Extra for West Indies, $4 85@5 00; South America, $5 00@5 10. SOUTHERN FLOUR—Common to Good Extra at $3 30@3 75; Good to Choice do., $3 80@ 5 30. RYE FLOUR—Superfine, $3 25@3 50. BUCKWHEAT FLOUR, at $1 90@2 00. CORN MEAL—Brandywine, at $3 00@3 05; Yellow Western, at $2 75@ 3 05. FEED—Bran ranges from 85@90c. from track and mill; for 00 lb. average at 80@82½c.; 80 lb. average at 80@82½c.; middlings at 80@90c., and sharps at $1 00@1 10. Rye feed at $17 00 per ton.

GRAIN.—WHEAT.—Ungraded Red, 86@91½c.; No. 2 Red, 89½c; No. 2 Red for February, 89½@90c.; do. for March, 90@90⅞c.; do. for April, 91¾@92¼c.; do. for May, 93@93¾c; do, for June, 93½@94c; do. for August, 94¾@95c.; do. for September, 95¾c; do. for October, 96c; do. for December, 99¾c.@$1 00⅜. RYE—60@63c. for Western, and 64@66c. for State. CORN—Ungraded Mixed 48½@49c; No. 3, 48¾@49¼c.; Steamer Mixed, 48¾ @48¾c.; Steamer Yellow, 49½c; No. 2, Mixed, 51¾c.; Ungraded White, 49c; Yellow, at 50½c; No. 2 Mixed for February, 50@50¾c.; do, for March, 48c; do. for April, 48¾@49c; do. for May, 48¼@48¾c. OATS—No. 3 Mixed, at 37½c.; No. 2, 38c.; No. 1 nominal at 39½c.; No. 3 White, 38½@38¾c.; No. 2 do. 39¾c; No. 1 at 43c.; Mixed Western, at 37@39c.; White State, 41c; No. 2 Mixed for February, 37¾c.; do. for March, 37½c; for April, 37½c; May, 37⅝c.

BEANS.—Quoted: Marrows at $1 70@$1 75; mediums at $1 50; pea at $1 50; red kidney at $2 00 for choice; turtle soup at $2 25; white kidney at $1 95@2 00 for choice.

PEAS.—Green at $1 20.

PROVISIONS.—PORK.—Mess quoted at $10 50@$11; $11 50@$12 00 for Family Mess; $12 75@$14 50 for Clear Back; and $8 50@$9 25 for Extra Prime. BEEF.—City Extra India Mess, $17 50@$18 00; Extra Mess, bbls., $10; Packet, $11 00@$12 00 in bbls.; Family Mess, $12 00@$13. BEEF HAMS.—Quoted at $18 00. CUT MEATS.—Pickled Bellies, 12 lb, average, 5½c; Pickled Shoulders, at 4½c.@4¾c.; Smoked shoulders, at 5@5¼c.; Pickled Hams, at 8¼@8¾c.; Smoked do., 9½c. MIDDLES—Long Clear in New York quoted 5¾c. for Western delivery. Long Clear, 5.50c.; Short Clear, 5.70c. DRESSED HOGS.—City Heavy to Light, at 5¾@6¼c.; Pigs, 5¾c. LIVE STOCK MARKET.

NEW YORK, SATURDAY, February 6, 1886.

With a light supply sellers tried to force prices upward, and some early sales appear to have been 10c. higher; but the general tone of the market unchanged for Poor and Common Cattle. The wholesale butchers carried over a good deal of stock last week, and beef has sold slowly ever since Monday, and the storm of Tuesday and the extreme cold to-day have caused a limited demand for meats of all kinds, so that the slight effect of the storm has been discounted, and not only has there been no "boom," but even the advance which would naturally be expected to follow a falling off in the receipts of over 4,000 head from last week, has not been realized. Shipments for the week, 1,131 live cattle, 5,660 quarters of beef, 855 live sheep, and 580 carcasses of mutton.

BEEVES.—Chicago steers, 1,289 lb, $5 85; do, 1,263 lb, at $5 35; do. 1,206 lb, at $5 05; Indiana do, 1,178 lb, at $4 60; Bulls, 1,465 lb at 4c; Chicago steers, 1,088 lb, at $5 12½; do, 1,282 lb, at $5 10; Ohio do., 1,207 lb, at $5 10; oxen, 1,240 lb, at $2 75; State do. 1,763 lb, $4 50; Indiana steers 1,189 lb, at $5 25; do. Cows, 1,113 lb, at $3 45; do., 1,380 lb, at $3 75; oxen, 1,251 lb. at $4 25.

CALVES.—Feeding firm, and Grassers are quoted at 2¾@2¾c; Fed Calves at 3@4c; and Ordinary to Choice Veals at 5@8¼. Extra would bring 9c. Fed Calves, 319 lb, at $3 10.

SHEEP AND LAMBS.—Receipts for six days, 30,592 head, against 36,584 head for the same time last week. Demand slack for sheep. Lambs firm and a fraction higher for good stock. Western Sheep, 79 lb, at 4¼c.; 209 State do, 77 lb, at 4½c.; Western Sheep and Lambs, 57 lb; at 5c; State Lambs, 65 lb. at 6¼c.; Ohio Sheep, 99 lb, at 5½c.; do, 88 lb, at $4.60.

HOGS.—Receipts for six days, 38,297 head, against 37,692 head for the same time last week. None for sale alive. Nominally steady at $1.22@$1.50 per 100 lb.

Best known for hatching chicks. Its principle is just like a hen sitting on a nest full of eggs. Chicks can be raised in it at 5 or 6 cts. per lb., and sold for 20 to 25 cts. per lb. A fine chance for women and boys to make money. Send for circular
Address Natures Incubator Co., Quincy, Ill.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.
It has never been surpassed as an increaser of pork and general system tonic. Aiding digestion, stimulating the biliary organs, preventing torpor and engorgement of the liver, and regulating the bowels, it removes and prevents the formation of disease germs, and preserves to the well bred hog his natural constitution. Where it has been fed to such animals in the prescribed quantities, and other directions faithfully observed, it has proved a thorough preventive against swine disease.
AS AN EVIDENCE OF FAITH
In my remedy I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and are neither in-bred, close-bred nor the progeny of such.
1. I will forfeit $100.00 to any breeder whose offer to examine for insurance I decline, provided he forwards remittance to cover my expenses to and from location of hogs, or I fail to prove to the satisfaction of any disinterested party, that failure to respond to invitation is caused by prior engagement or by matters of at least equal importance.
2. I will forfeit $500.00 if I decline upon examination to insure such herds, if my judgment as to their condition of health is overborne by the result of an examination made by at least two properly qualified and graduated veterinary surgeons.
Facts are Better than Assertions.
Please read the following testimony:
GIBSONTON P. O., PA., Feb. 2, 1885.
Dr. Jos. Haas—Dear Sir: About a year ago our herd here numbered about 2,700 head. Disease broke out, and no remedy we had would arrest the trouble. Our losses were heavy and we had to give up feeding entirely for about two months. We then heard of your remedy and bought a trial lot, and began feeding again. We have used it constantly ever since. We have since April last received about 5,000 head of hogs into our herd and have not had a single death from swine disease. This is our experience. Our opinion is that the remedy has prevented disease, and we would not think of being without it. As an aid in fattening pork, we believe it to be good. On this point, however, we have not made an actual test, as we would not risk feeding a pen of hogs without the Remedy.
Yours very truly, WHITE & CO.
[N. B.—White & Co., since writing the above letter, have purchased $4.50 worth of the remedy.]
The remedy can be procured of all Druggists, or from my laboratory. Prices, $2.50, $1.25 and 50 cts. per package. 25 lb. cans, $12.50.

Acknowledged superior to all others. Working equally well on level land. Small sizes specially adapted for Vineyards, Terracing, or Gardening.
Correspondence solicited. Send for Catalogue.

For the Young.

HOLD ON TO YOUR YOUTH.

I saw an old man with a grizzled head
And a face like a piece of leather,
And his eyes were dim and his nose was red,
And his few teeth jumbled together.
He had cash enough for a bank to spend;
He never could count his treasure,
But all of the money he had to lend
Couldn't buy him an ounce of pleasure.
He had frozen the hopes of his boyhood out
To further his great ambition;
His heart was withered and dry, no doubt;
It was surely a sad condition.
And I thought how happy he might have been,
With a wondrous hope before him,
Had he kept the dreams of his boyhood green
In his heart, and its hope thrown o'er him.
They tell me that youth is the best of life,
That a whitened head brings trouble,
That the hopes of youth in the winds of strife
Will burst like an airy bubble.
But don't you believe what the croakers say,
Though the top of the head be whitened,
Though the eyes grow dim and the joints lose play,
With hope you can keep the heart brightened.
Then cling to your youth, my boys and girls,
You will need it in life's to-morrow;
It will dull Time's scythe as it ceaseless whirls
And break down the teeth of sorrow.

—UNCLE MARK.

THIS is the season for buckwheat cakes. As a rule it is better fun to eat the cakes than it is to cook them. The members of the family who do most of the eating and least of the cooking should remember this, and show more appreciation.

What are you going to have in the garden this year? It is about time to begin to think about it. We can get our plans made, and then, when the time for planting comes, we know just what we are going to do. Don't try to plant too many things. Better select a few things and devote all the time we can to their cultivation.

Why not try a little experiment this year with canary bird seed? Get a package of seed, pick out a few of each of the different varieties, sow in good soil, and see what the result will be. I shall want to know how this results.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I have not written for so long, that I think it is fully time to write this letter, if I wish to continue a member of the Y. H. C. Last Spring, the 18th of May, my little brother and I planted a few peanuts; they came up within 10 days, and Travers, my brother, had three vines and I had two. We dug them in the early Fall as soon as the frost had sufficiently killed the vines. Upon counting the peanuts, we found that they averaged 50 to each vine, as Travers had 150 peanuts from his three vines, and I had 100 from my two vines. We dried and roasted a few, and they were very good. In my garden last Summer, I raised radishes, lettuce, salsify, red peppers, and a few carrots and onions that did not amount to anything. I also had several short rows of sweet peas which were beautiful. The Cousins who have raised sweet peas know how rich and varied the flowers are; and those who have not, will be well repaid in beautiful flowers by raising some next Summer. My lettuce was very nice; but I could not raise any nice radishes, for every one seemed to have a little worm in the root. The salsify has not been eaten yet. I had some pretty flowers, but I did not have them in a good place, for the bed was around an arbor, and the roots of the vines that covered the arbor took up most of the food in the soil. I did not plant my Lima Beans, because I did not want to undertake too much for fear that I would not accomplish anything, as I had my flower and vegetable gardens to take care of.

Your niece, CERISE E. A. CARMAN.

River Edge, N. J.

[It is much better to do a few things well than to undertake too many things I wonder that more of the Cousins do not try to raise peanuts.—U. M.]

DEAR UNCLE MARK: I have thought it was about time for me to attend one of the meeting of the Cousins. One of them says her father gave her a piece of ground for a garden all to herself. That's the kind of father I like, and she ought to love him with all her heart. I guess she does. When I was a little boy my mother gave me a piece of ground for a garden, and made me very happy. I am always happy now when I think of it. I loved my dear good mother fondly; and though she has been dead many years, there is nothing for which I cherish her memory more lovingly than that she gave me that plot in the garden and perseveringly and tenderly taught me how to grow flowers. It has been a constant source of happiness to me all through life. I would therefore urge all the fathers and mothers who read the RURAL to give the children some spot that they may call their own for the purpose of growing plants. Give them, too, a few pet animals, and so, among other good things, develop and foster the sense of ownership. Besides making them thoughtful, it will open up a new life for the Cousins, which I know they will appreciate and be grateful for.

COUSIN HORTICOLA.

DEAR UNCLE MARK: I am much interested in the Horticultural Club, and want to do what little I can to make it interesting to others. I have had good luck raising potatoes from the seed. I planted the seed in a little box, and when the plants were about three inches high, I transplanted them. I had 14 of them, and among the rest I found one that was white with a red end. Some of them were white with red spots the si of a pin-head all over. Some had deep eyes, and on some you could hardly see the eyes. Uncle Mark, if you would like one of my little potatoes, I will send you one. Pa bought a packet of squash seed last Summer, and among them was one seed different from the others, and I took it and planted it by itself. I got two squashes that weighed 77 pounds. The smallest weighed 32 pounds, and the other weigh·d 45. If any of the Cousins would like to try to grow them, and will send me their address, I will send them some seed. Your niece,

LIZZIE HARDCASTLE.

Eldred P. O., Sull Co., N. Y.

[You may send me the potato if you will. I am glad you did so well. The Cousins will do well to send for some seeds.—U. M.]

DEAR UNCLE MARK: As I can't go to school to-day, I will write a letter. We only have four months' school and it is half gone. I have gone to my sister for three years. Papa is the County Superintendent. He started yesterday to visit the schools. I believe there are 117 schools in this county. The reason that I didn't go to school to-day is that I have such a bad headache. It has ached every day since last February. If any of the Cousins know what is good for it I wish they would please tell in the next letter they write. Uncle Mark has promised to tell us about his trip with a Mustang pony. I am anxious to hear it as we had one when we lived in California. We lived there 13 months. Our pony's name was Kate. They are such good travelers. We lived in Santa Cruz. Papa went to the Yosemite Valley to see the big trees. He traveled about 40 miles per day, I believe. I still attend the Literary. Last Saturday was election night, and my sister was elected Critic. She also debated, the question being: "Resolved, That the use of tobacco should be prohibited by law." Your niece,

Wood Co., W. Va. CARRIE MCKUSICK.

[Now who can tell what to do for the headache. We all have it at times, and we all want to cure it. How many think there ought to be a law against the use of tobacco?

UNCLE MARK.]

DEAR UNCLE MARK: I am a little red-headed girl, 10 years old. My Papa has taken your paper a long time, and I like to read the little Cousins' letters, and I think them very nice. And I think that old Cousin that has such a funny name, "Horticola," is very nice, because he keeps flowers and plants. Papa grows them too, and in the Summer, I gather lots of flowers when I want them. Papa has some very nice flowers, and some of them are very funny; they grow on nothing but pieces of wood, and I just wish you could see them, Uncle Mark, they are just awful nice. Oh, I almost forgot to ask you if I can join the Y H. C., but I most know you will let me, for I have read so many of your talks, that you seem like you was too nice to say "no" to anybody. But I must not make this letter too long, for if I do, you won't ever want me to write to you again. Your niece,

Logan Co., Ohio. MARY F. DRAPER.

[Yes, indeed, you may join. I am glad you like flowers. I can say "no" quick enough and sharp enough, too, when people do wrong. I hope I never shall have to be cross with any of the Cousins.—U. M.]

DEAR UNCLE MARK: I am a farmer boy way out in the State of Minnesota in the county of Nicollet. It is situated in the southern part of the State, so we are no near neighbors to polar bears. Our county is very little wooded, but it is level and fruit-bearing. The inhabitants consist of English, Scandinavians, Germans, etc., in our town they are nearly all Scandinavians, and so you see that am a Swede, though I was born in America. I received the RURAL for the first time January 2, and I like it very much. It was the bes paper I ever read. It has been rather a dry Summer here. We had no snow until the last days in December it fell little, and to-day it is a kind of snow storm. Your nephew,

Nicollet Co. F. JOHNSON.

[I am glad you are not near the bears; they would make very poor neighbors, in my opinion.—U. M.]

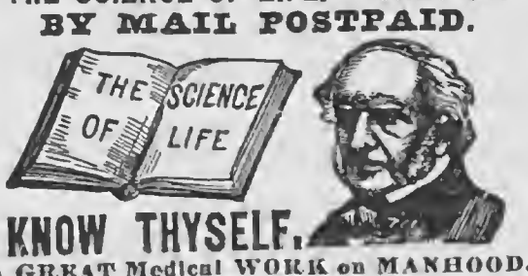
Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

THE SCIENCE OF LIFE. ONLY $1.
BY MAIL POSTPAID.



KNOW THYSELF.

A GREAT Medical WORK on MANHOOD.

Nervous and Physical Debility, Premature Decline in man. A book for every man, young, middle aged and old. It contains 125 prescriptions for all acute and chronic diseases, each one of which is invaluable. So found by the author, whose experience for 23 years in such has probably never before fell to the lot of any physician. 300 pages, bound in beautiful French muslin, embossed covers, full gilt, guaranteed to be a finer work in every sense—mechanical, literary and professional—than any other work sold in this country for $2.50, or the money will be refunded in every instance. Price only $1 00 by mail, postpaid. Illustrated sample 6 cents. Send now. Gold medal awarded the author by the National Medical Association, to the officers of which he refers.

The Science of Life should be read by the young for instruction, and by the afflicted for relief. It will benefit all.—*London Lancet.*

There is no member of society to whom The Science of Life will not be useful, whether youth, parent, guardian, instructor or clergyman.—*Argonaut.*

Address the Peabody Medical Institute, or Dr. W. H. Parker, No. 4 Bulfinch Street, Boston, Mass., who may be consulted on all diseases requiring skill and experience. Chronic and obstinate cases that have baffled the skill of all other physicians a specialty. Such treated successfully without an instance of failure.

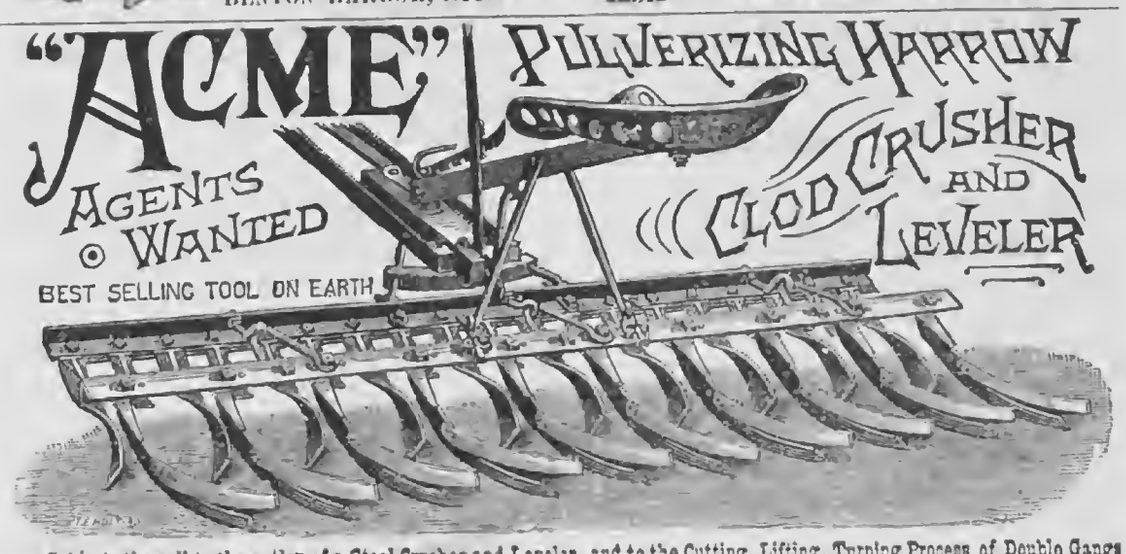
"ACME" PULVERIZING HARROW
AGENTS WANTED
BEST SELLING TOOL ON EARTH
CLOD CRUSHER AND LEVELER



Subjects the soil to the action of a Steel Crusher and Leveler, and to the Cutting, Lifting, Turning Process of Double Gangs of Cast Steel Coulters. Immense cutting power. Crushing, Leveling and Pulverizing performed at the same time. Entire absence of Spikes or Spring Teeth avoids pulling up rubbish. Only Harrow that cuts over the entire surface of the ground. Sizes, 3 to 15 ft. wide. With and without Sulky attachment. We deliver free at Distributing Depots.

FAIR PLAY. DO NOT BE DECEIVED. Don't let dealers palm off a base imitation or some inferior tool under the assurance that it is better. SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL. We will send a double gang Acme to any responsible farmer in the United States; if it does not suit, he may send it back, we paying return freight. We don't ask pay until tried on his own farm.

Send for pamphlet containing thousands of testimonials from 18 States and Territories.

Branch Office, HARRISBURG, PENN. NASH & BRO., Manufactory and Principal Office, MILLINGTON, NEW JERSEY.

N. B.—"TILLAGE IS MANURE" and other essays sent free to parties who NAME THIS PAPER.

PERSONALS.

THE aggregate amount of the pension drawn by the late Lord Brougham as a retired Master in Chancery was $530,000.

BLAINE frequently joins the boys "coasting" on the hillsides north of Augusta. Coasting should be good in any part of that uneven town.

JUSTICE MILLER, of the United States Supreme Court, is said to be a perfect picture of an old monk as he sits on the bench, wearing a dark velvet skull-cap.

THE Prince of Wales now wears a black silk ribbon as a watch-guard, and about the first of next July the Anglo-maniac in this country will affect the same style.

SENATOR BECK, it is said, can repeat "The Lady of the Lake" from memory, knows Burns by heart, and thinks there are no novels equal to those of Walter Scott.

DAVID ABEL, a minister of Burlington, N. J., who died the other day, provided in his will for the "pasturing and propagation of goats, in order to encourage the use of their flesh in the place of that of swine as an article of food."

THE richest men in Russia are two Swiss brothers named Noble. They bought up immense tracts of oil lands and now control, it is said, more petroleum than the Standard Oil Company. Their wealth has been estimated at $400,000,000.

MISS MARY GLADSTONE, daughter of the great English Premier, was married on Tuesday morning, to the Rev. Harry Drew, of Hawarden, now Gladstone's home. Among those present in addition to the immediate relatives, were the Prince and Princess of Wales, their sons and Lord Roseberry, with many other notabilities.

TH only girl student at the Yale Law Schoo has left the institution because the faculty have notified her that they couldn't grant her a diploma even if she passed a brilliant examination. This shows what it is to be unable to play base ball, break or bark a rival's shins at football, or knock fellows on the shins with a polo club.

A LADY clerk in the Interior Department was offered $5,000 and then $10,000 by a representative of a New York firm for a copy of Secretary Lamar's decision in the Bell telephone case, which she had transcribed. At the second offer she excused herself a moment and stepped into the Secretary's private office. When she returned the Secretary accompanied her, gave the speculator a very plain talk and informed him he would give him just 10 seconds to leave the room. It was wanted for stock jobbing purposes!

FAIR AND SQUARE DEALING.

Believing that if a man has dealt squarely with his fellowmen his patrons are his best advertisers, I invite all to make inquiry of the character of my seeds among over a million of Farmers, Gardeners and Planters who have used them during the past thirty years. Raising a large portion of the seed sold, (few seedsmen raise the seed they sell) I was the first seedsman in the United States to warrant (as per catalogue) their purity and freshness. My new Vegetable and Flower Seed Catalogue for 1886 will be sent **FREE** to all who write for it. Among an immense variety, my friends will find in it (and in none other) a new drumhead Cabbage, just about as early as Henderson's, but **nearly twice as large!** **James J. H. Gregory, Marblehead, Mass.**

850,000 GRAPE VINES
100 Varieties. Also Small Fruits. Quality unsurpassed. Warranted true. Very cheap. 8 sample vines mailed for 15c. Descriptive price list free. **LEWIS ROESCH,** Fredonia, N. Y.

THE SEED DISTRIBUTION

of the RURAL NEW-YORKER is sent to all REGULAR subscribers who APPLY INCLOSING A STAMP. It is sent ONLY to REGULAR subscribers.

Humorous.

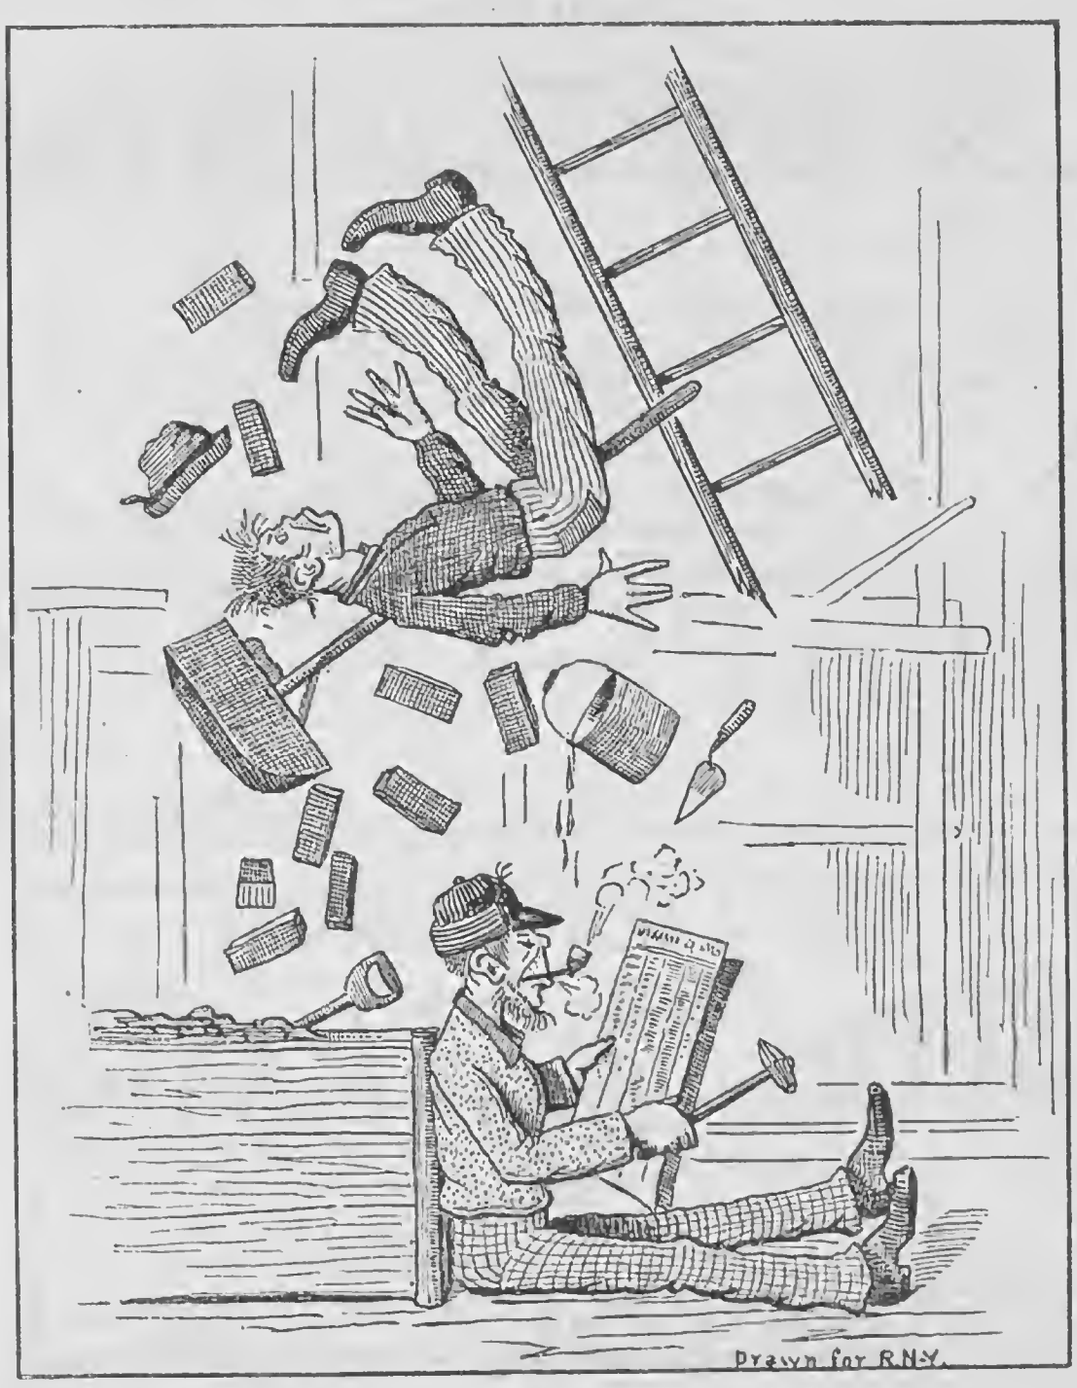
AN Iowa judge has decided that a man is in duty bound to tell his wife where he spends the evenings when he is away from home. This decision is all right to a certain extent, but suppose the man doesn't know.

THE world is full of people who go about fighting windmills and wasting effort in struggling with imaginary evil, but the man who attends to his own business and pays cash for groceries is the one with whom prosperity loves to roost.

"I TELL you, Fanny, I am bound to succeed. I have the aptitude. It is close attention to little things which makes a man succeed." "Ah, indeed! Well, that explains it." "Explains what, Fanny?" "Why you pay so very close attention to your moustache."

"I WOULDN'T worry about the cholera, dear," said a wife to her husband; "it isn't at all likely it will reach this country." "I don't know about that," he replied, nervously; "it might reach us at any moment, and we might have a frightful time. I—I think I had better pay the back pew rent, anyway."

"GENTLEMEN," said a tattered tramp, as he approached a settee in City Hall park, which was entirely occupied, "I am very tired. Will one of you be kind enough to get up and give me a seat?" No one moved; but all gazed at the impudent nomad with a stony stare. "Gentlemen," pleaded the vagrant, "you have no idea how tired I am. I left Montreal"—— Suddenly the seven men on the settee with one accord jumped up and fled, without looking around. "Yes," said the tramp, as he stretched himself out at full length on the bench, "I left Montreal when I was a boy."



Patrick, taking siesta—"Another wan av thim tornados out West! Oi wondher phat 'll come nixt."

PREMIUMS WITH EVERY ORDER, and Greenhouse Supplies, of 130 pages, with 300 illustrations, including Valuable Suggestions for the Amateur Cultivator for each month in the year—how to care for Plants, when to Sow Seed, &c.—free to all customers of last year; to others, 20 cts. in stamps. Address, **ROBERT J. HALLIDAY, SEEDSMAN & FLORIST, Baltimore, Md.**

My Descriptive Catalogue for 1889, of Seeds, Bulbs and all Garden

FEED YOUR LAND AND IT WILL FEED YOU.

SARDY'S CONCENTRATED PLANT FOOD.

A COMPLETE BONE MANURE FOR ALL CROPS.

GUARANTEED ANALYSIS.

Available Phosphoric Acid,	*8 to 9 per cent.*
Bone Phosphate (undissolved),	*4 to 6* "
Ammonia,	*2 to 2½* "
Sulphate of Potash,	*4 to 5* "

Price $28 per Ton.

FREIGHT PAID TO YOUR NEAREST R. R. STATION.

Discount on orders for one or more car loads.

Every batch of this fertilizer is analyzed by *Messrs. STILLWELL & GLADDING*, Chemists to the N. Y. Produce Exchange, whose high reputation is abundant guarantee that the goods are equal to the analysis.

Buyers are invited to have samples drawn and analyzed by their STATE CHEMISTS, and the fertilizer is guaranteed to come up to the above standard by their tests.

This Concentrated Plant Food is the result of 20 years' experience in the manufacture and use of chemical manures. It is a far higher grade than any fertilizer ever before offered to FARMERS for $28 per ton, PROPORTIONATELY cheaper than any higher or lower priced brand, and cheaper than farmers could buy the ingredients and make it.

It is warranted to contain no leather, shoddy, hoofs, horns, or similar material; all its fertilizing elements being in their most *available forms.*

Compare the analysis and price (*which includes freight*) with other brands.

A. L. SARDY, 10 BURLING SLIP, corner Water Street, New York.

THE POPPLEIN SILICATED PHOSPHATE CO.

Manufacture and have Constantly in Stock the following Popular Brands of

FERTILIZERS.

Perfection Ammoniated Bone,
The Active Ammoniated Bone,
The Model Ammoniated Bone,
The Favorite Ammoniated Bone.

The Popplein Silented Phosphate,
Alkaline Bone Phosphate,
Soluble Bone Phosphate,
Acid Phosphate.

Pure Raw and Dissolved Animal Bone.

Goods Compounded According to any Special Formula Desired on Short Notice.

ALL GOODS GUARANTEED.

OFFICE: 128 W. BALTIMORE ST., **BALTIMORE, MD.**

FACTORY AT CANTON, BALTIMORE CO.

HOLSTEIN-FRIESIAN CATTLE!

ALL AGES AND BOTH SEXES. HOME-BRED AND IMPORTED.

Cows and Heifers Bred to best Netherland and Auggie Bulls.

The average Records of a Herd are the true test of its merit.

The following Milk and Butter Records have all been made by animals now in our Herd:

MILK RECORDS.

Five Cows have averaged over 19,000 lbs. in a year. Ten Cows have averaged over 18,000 lbs. in a year. Three Cows have averaged over 20,000 lbs. in a year.

We know of about 30 Cows that have made yearly records exceeding 16,000 lbs., and 14 of them are now in our Herd and have averaged over 17,500 lbs.

Twenty-five have averaged over 16,000 lbs. in a year. Sixty-three, the entire number in the Herd that have made yearly records, including fourteen 3-year olds and twenty-one 2-year olds, have averaged 12,785 lbs. 5 ozs. in a year.

BUTTER RECORDS.

Five Cows have averaged 20 lbs. 7 ozs. in a week. Nine Cows have averaged 19 lbs. ½ oz. in a week. Fifteen Cows have averaged 17 lbs. 6 ozs. in a week. Six 3-year olds have averaged 14 lbs. 3 ozs. in a week. Eleven 3-year olds (the entire number tested) have averaged 13 lbs. 2 ozs. in a week. Six 2-year olds have averaged 12 lbs. 1½ ozs. in a week. Fifteen 2 year olds (entire number tested) have averaged 10 lbs. 8 3-10 ozs. in a week. The entire original imported Netherland Family of six cows (two being but three years old) have averaged 17⅝ lbs. in a week. This is the Herd from which to get foundation stock. Prices low for quality of Stock.

SMITHS, POWELL & LAMB,

LAKESIDE STOCK FARM, SYRACUSE, N. Y.

SCIENTIFIC GRINDING MILL

THE BEST MILL ON EARTH

For Grinding Ear Corn, Shelled Corn, and all Small Grains. Grinding Plates a special metal, hard as steel. Have double capacity, as they **sharpen themselves** on being reversed. Fully Guaranteed. Send for illustrated Catalogue.

THE FOOS MANUFACTURING CO.,
SPRINGFIELD, OHIO.

Eastern Branch Office 216 North Broad Street, Philadelphia, Penn.

ORGANS The most beautiful and finest toned in the world. Low prices, easy payment. Send for Catalogue. Address Weaver Organ & Piano Co., YORK, PA.

FOWLER'S HAY CARRIERS, FORK & PULLEYS.

The best in use, and guaranteed to do all that is claimed for it. Send for circular to

GEO. H FOWLER, Tunghannock Falls, N. Y.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1882. NEW YORK, FEBRUARY 20, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

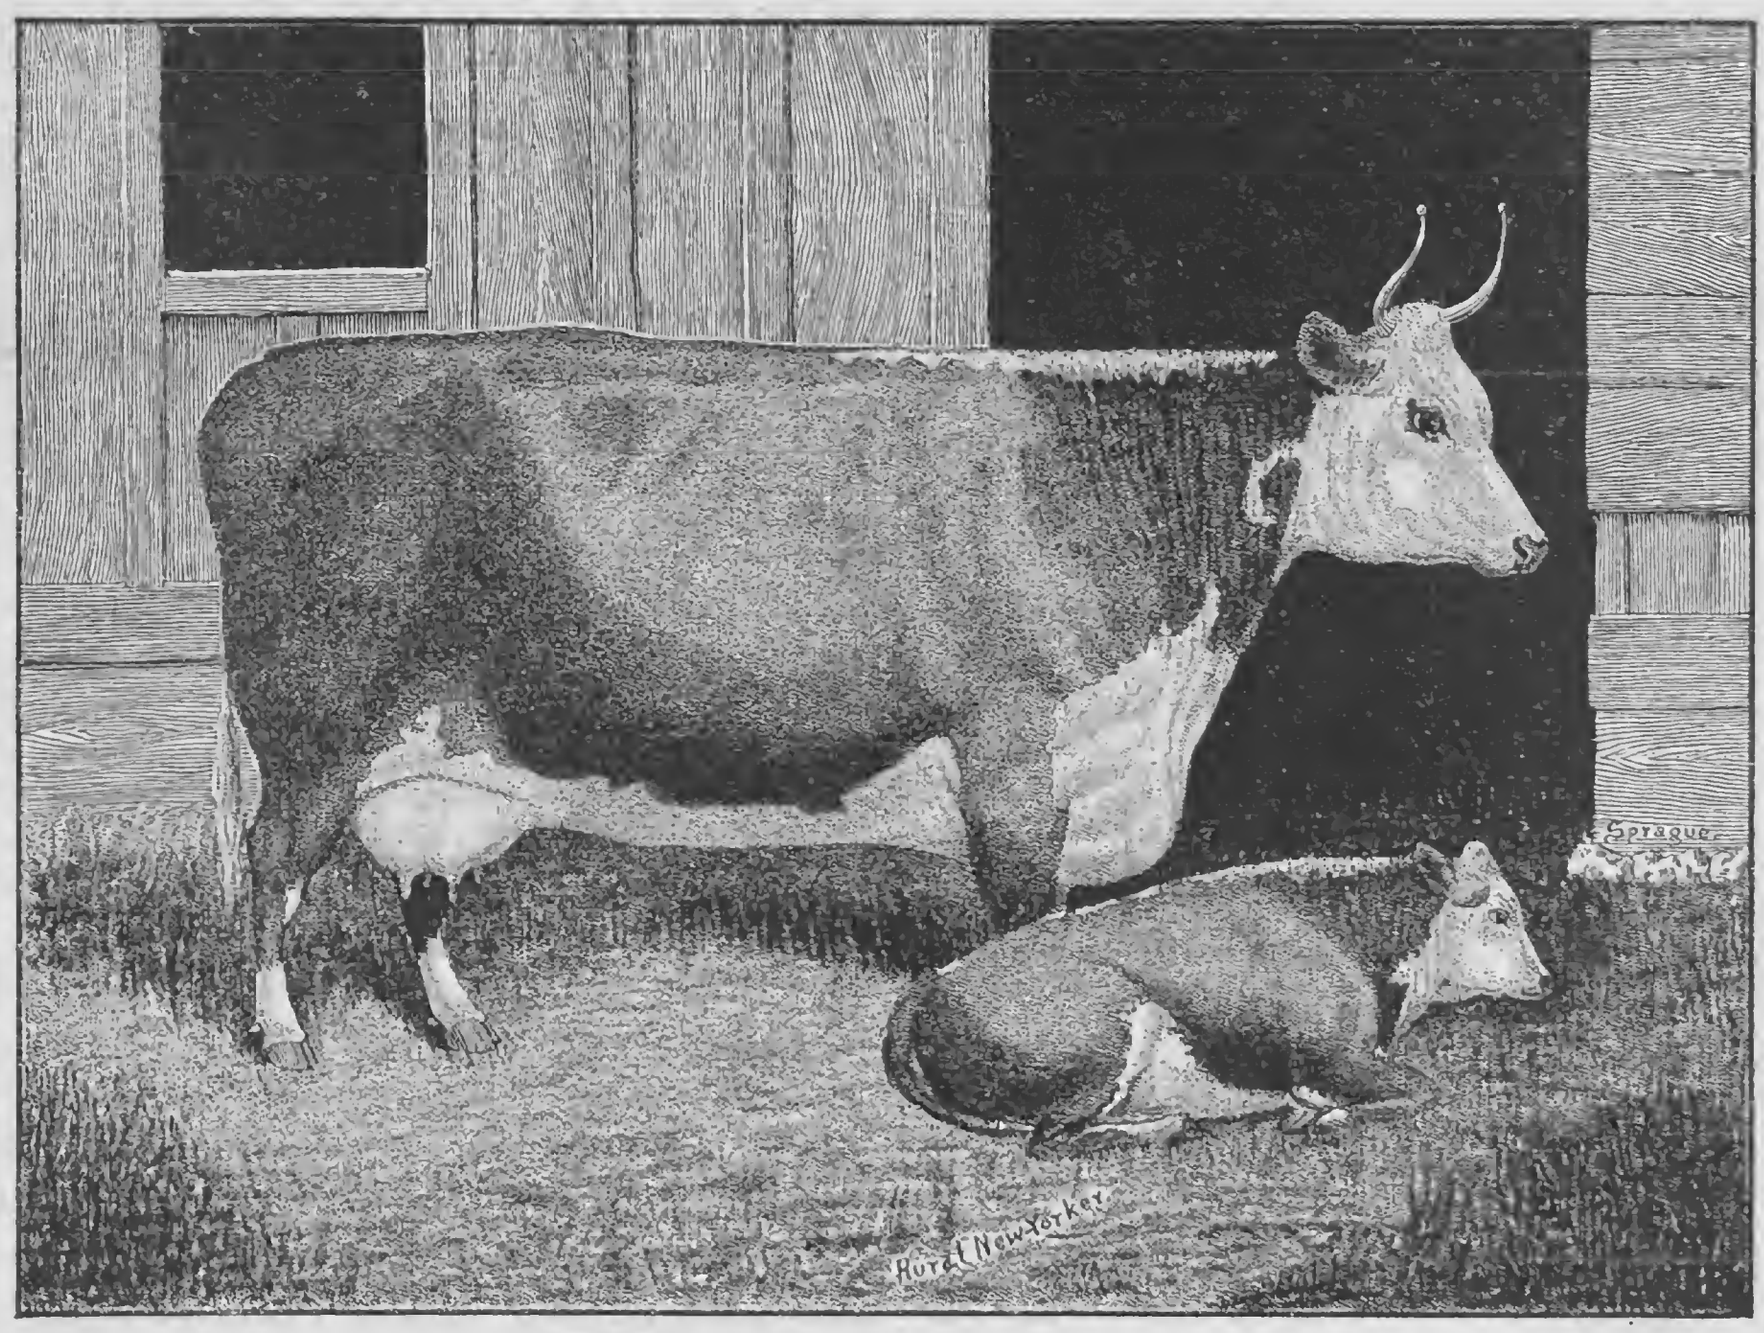
Dairy Husbandry.

A FINE HEREFORD COW.

WE show, at Fig. 73, a beautiful specimen of the Hereford breed of cattle. This cow, Lemon 2d, is an imported animal bred by Mr. B. Rogers, of Herefordshire, England. Since 1881 she has occupied a place in the fine herd belonging to the Agricultural College of Michigan. She has won a large number of first premiums at leading fairs, and is, without doubt, one of the best Herefords in Michigan. The cattle at the Michigan College are of the first order of merit. Under the skillful management of Prof. Johnson the herd has been greatly improved.

Short-horns predominate, yet there are specimens of all the popular breeds, so that students can study the characteristics of each. Stock growing is such an important feature of Western agriculture that it seems proper to push it to the very front in agricultural education. The stock at such institutions should be of the finest quality, so good that the surplus will always be in demand among the farmers of the State. The annual sales of stock from the Michigan College amount to $8,000, while the 250 students are supplied with milk from the dairy herd. The Short-horns have long held full sway in Michigan, but the Herefords are now rapidly growing in favor. One man has established a "White-faced dairy herd" that bids fair to become famous.

At a Farmers' Institute held a few years since, a successful breeder who had handled both breeds, stated that in his opinion, a cross between the Short-horn and Hereford would produce the finest breed the world has ever known. This seems possible when we study the pedigrees of many of the winners at recent fat stock shows. It is possible that some enthusiastic breeder with a fortune and a life-time to devote to the enterprise, may reach results that will rival in importance those of the famous Collings.



HEREFORD COW, LEMON 2d. Fig. 73.

WISCONSIN DAIRYMEN'S ASSOCIAT'N.

(RURAL SPECIAL REPORT.)

Attendance and interest good; bogus dairy products; selection of dairy stock; feed for dairy stock; roots for stock; ignorance in dairy matters; twaddle about the dignity of labor; amusements for the young; discriminating cows; effects of feed on the composition of milk; temperature in churning; no general-purpose cow in the dairy; experiments in feeding for milk and butter; ensilage; Farmers' Institutes; annual profit for dairy cows; woman in the cheese room.

THIS association met in its fourteenth annual convention, at Richland Center, January 26th. It was well attended, and the talent present was of a superior order. The interest was kept up to the close.

After the preliminaries were over, President Morrison read his opening address, bristling with suggestions and good points. Among other things, he said that at this stage of progress no one should expect to succeed in dairying who pursues it in a mere routine way. To be successful it must be pursued in a business way. He expressed the opinion that one-quarter of the so-called butter now thrown on the market is bogus, and that no law will ever afford protection to the best article of butter, which must be above all imitation or successful counterfeiting. So long as so much inferior butter is made, bogus butter has come to stay, for at least 60 per cent. of the butter in market is inferior to the products of the Chicago grease-vats. He favored protection of the consumer and the dairyman against fraud, by appropriate laws vigorously enforced. These sentiments met with the approbation of the convention.

Fred. E. Carswell found careful selection of dairy stock the first and most important step to be taken by the dairyman. He would not favor any one breed, because no one will suit all tastes and circumstances; but he would be careful to select cows with all the dairy characteristics, and breed pure or toward purity for the purpose of keeping up and improving the standard of excellence. The care of a dairy herd is important, but not as difficult to understand as is the selection. He recommended corn and shorts for winter grain feed; corn and oats for spring, and bran for summer feed. He believes in so feeding as to keep up the flow of milk and the condition of the cow at all seasons.

Hon. H. C. Adams contended that the dairyman should aim at the production of 300 pounds of choice butter per cow every year. This will afford twice the net profit of a yield of 200 pounds. He thought that it cost about $10 to pasture a cow through the Summer, or five cents a day. He recommended the growing of pumpkins, and recommended the removal of the seeds before feeding them. But they should be cultivated by themselves, on well manured ground, in hills eight feet apart. In this way, it is impossible for the bugs to keep up with the procession. His cows are fed grain twice a day, each time immediately after milking. He would feed three parts, by weight, of cut hay or stalks, with each grain ration. Corn and oats, ground together, produce the best-colored milk. No ration, exclusively of one kind of grain, equals ground oats, but these are too expensive if they cost over 20 cents a bushel. A cow needs change in her grain feed. A good alternation is from middlings and bran to corn meal and oil meal, or oat meal and middlings. Rye bran is good; but buckwheat bran is a nuisance. Malt sprouts are as nitrogenous as oil meal, but need soaking three days before they are fed. They weigh as light as bran, are sweet and relishable and easily digested. Clover cut in full bloom is the best hay, and millet ranks next. Corn fodder and fodder corn should always be run through a feed-cutter. The indications are that the silo is assuming a shape that will make a half revolution in our feeding processes, for there is need of a succulent food for winter use. Good management still secures a net profit to the dairyman,-even in these hard times of close competition.

T. D. Curtis read a short paper on the unknown in dairying. How to reach the great non-progressive mass who do not attend conventions or read papers, is still an unsolved problem. By holding conventions at different places, a few of these may be attracted and instructed; but there is such a multitude of them that the number benefited would be comparatively small. The man of experience in dairy matters is the man who is least positive about what he knows, and the one most desirous to learn. "Trifles light as air" are floating in the atmosphere, and often find their way into the milk, to the discomfiture of the unlucky dairyman. Knowledge and care are necessary to guard against or overcome these occult difficulties. Milk is a very complex and sensitive compound, mixed both chemically and mechanically, and is subject to manifold influences that hasten decay from the moment it is drawn until it is consumed or has gone into final decomposition.

Mrs. C. V. Layton, in a paper on the dignity of labor, ridiculed and satirized the hypocritical twaddle on the subject indulged in by orators and writers. Labor is a hard fact, useful, elevating and necessary, but often very far from being dignified. Martha Washington doing her own house work with her hands covered with dough and her face powdered with flour, would be a very different-appearing personage from Lady Washington with powdered hair and clothed in fashionably-made dresses of silks and brocades. "The strength of the State lies in the welfare of its weakest members. May we not all be employed in welding this chain of brotherhood? We are called to work with heart, head and hand—to work while the day lasts, 'for the night soon cometh when no man can work.'"

Mrs. D. G. James took up the subject of amusements for the young; there is a pressing need for something that will cultivative a refined sociality and at the same time not lead to excess and dissipation. Exuberant youth will not consent to be chained down to the sober routine of life that satisfies conservative old age. While the dangers that are encountered in cities and villages are not so imminent among a scattered rural population, there is hardly less danger in the isolation that makes the soul yearn for social intercourse, and fills it with a desire to mingle in the activities of the great outside world. There is danger in both extremes, and how to strike a just balance that will be satisfactory, and avoid both Scylla and Charybdis is the problem of the hour. This must be done by appealing to both head and heart, and subjecting all amusements to the guidance of reason and the dictates of virtue. None feel a deeper interest in this problem than the mothers of our land who have no voice through the ballot box in regulating the public places of resort, and guarding against the pernicious outside influences which

.nfest every community. A cheerful, sociable home is the best safeguard.

In presenting the yesterday and to-day of dairying, the Rev. L. B. Loomis reviewed the progress of dairying from the days of David to the present time, with many pertinent hits. "The wife and daughter of yesterday were the cheese-makers, dividing their time between the spinning wheel and cheese tub; between the cradle and the milking stool. The fittest survived, and I believe in as large numbers as now to over come the skating rinks and progressive euchre." We want improved breeds of cows that will not swallow frogs when they drink water, that abhor tallow from Texas steers, that are Jews in their abhorrence of swine fat, that will not give down to dirty milkers, and that will kick over every pail of milk into which dirt has fallen.

Prof. H. P. Armsby gave some experience in feeding for the purpose of ascertaining the effects of feed on the composition of milk. Rich feeding generally increases the flow of milk, but is more marked in its effects in producing better quality. It increases the proportion of solids to fluids, by reducing the per cent. of water. But the relative proportion of fat to casein is rarely changed perceptibly. In a very few instances there has been a slight increase in the proportion of fats. In one instance, and on one cow only, palm-nut meal had this effect.

Prof. Henry E. Alvord in a talk on churning emphasized the importance of paying more attention to temperature. Different seasons, different cows, different feed, different conditions, etc., require different temperatures, which range all the way from 56 to 70 degrees.

Mr. C. R. Beech argued that a good cow should return her owner $50 to $60 per annum, gross receipts. Less than this would not afford any net profit.

Prof. L. B. Arnold considered the question of dairying and the state of the art. He emphasized the importance of sweet rennet, drawing the whey sweet, holding the curd warm in the vat or sink until the cheesing process is well developed, and curing in a room the temperature of which can be perfectly controlled.

W. D. Hoard went for the "general-purpose" cow, and wanted to know what a cow is for. He concluded that she is either for the production of milk or for the rearing of calves for beef. It is impossible to combine successfully the two functions, and it is foolish and wasteful economy to hold for years a beef carcass that does not give a paying yield of milk and makes very poor beef at last. The special dairy cow gives enough more product, than the general-purpose cow, to buy the latter outright every year.

Prof. W. A. Henry related a little experiment in growing and feeding corn. He got 4,490 pounds of corn-stalks and 4,941 pounds of corn from an acre. By exchanging corn meal for bran, pound for pound, so as to make the relative proportion 25 pounds of corn meal to 35 pounds of bran, he found he had grain feed enough to make 324 pounds of butter, but only corn-stalks enough to feed with the grain for the production of 115 pounds of butter. The lack of the balance of coarse feed for the production of the 324 pounds of butter had to come from an outside source, there being only about one-third enough corn-stalks on the acre. In another experiment, it took 71 pounds of mixed hay (one part of clover to two parts of Timothy), 26 of corn meal and 36 of wheat bran to produce 100 pounds of milk, and 1,348 pounds of mixed hay, 500 of corn meal and 700 of wheat bran to produce 100 pounds of butter. Substituting corn-stalks for the hay, it took 195 pounds of corn-stalks, 25 of corn meal and 35 of wheat bran to produce 100 pounds of milk, and 3,880 pounds of corn-stalks, 514 of corn meal and 719 of wheat bran to produce 100 pounds of butter. On clover hay, it took 60 pounds of clover hay, 26 of corn meal and 37 of wheat bran to produce 100 pounds of milk, and 1,177 pounds of clover, 513 pounds of corn meal and 718 pounds of wheat bran to produce 100 pounds of butter. One of the cows was a full-blooded Jersey, the other a half-blood, and the third a native.

John Gould highly commended the silo. There are 17 in his neighborhood in Ohio, and they are growing more popular every year. The corn is grown in rows four feet apart, drilled in at the rate of one bushel to the acre, which makes the stalks stand three to four inches apart in the row. At first the field is harrowed with a smoothing harrow, and this is repeated until the corn is large enough to hill. This keeps down all the weeds, the ground being well prepared to begin with. Then a horse cultivator is run between the rows, with the teeth set so as to throw the dirt up against the rows. The corn is cut just as it is fit to roast, and run through a feed-cutter, which reduces it to half-inch lengths. It is slowly filled into the silo, which is divided into three compartments, and the cutting is done into a single compartment each day. This gives the cut stalks time to settle and heat. Two or three days after the last cutting, closely-fitting planks are put on the top of the stalks and covered with two or three inches of clay. The work is then complete until time to feed, when the entire covering to a compartment is removed, and each foddering is a layer taken from the entire surface. When fed in conjunction with some nitrogenous food, the milk product is said to be superior. The silage is known as "sweet" because the amount of acidity is so slight.

J. A. Smith spoke highly of the success of the Farmers' Institutes which are held throughout Wisconsin during the Winter. He estimated the feeding value of three tons of silage as equal to that of one ton of hay. Twenty-five tons of silage per acre is an average yield. There are 1,800 pounds of solids in a ton of hay, and only 900 pounds of solids in three tons of silage, but the latter has the advantage of being in a more available form for digestion and assimilation, which gives the solids double value as compared with dry hay.

Hiram Smith believes in rich thinking, rich soil and rich feeding. He has a grade Jersey herd, has put in a silo, and expects to keep 100 cows on 200 acres, 20 of which are woodland. He now has 64 cows; he formerly had only 40. He thinks that the milk of 40 or more can be more profitably worked up on the farm. He formerly got only $45 a year from each cow, but now he gets $65.

Mr. A. J. Decker thinks Wisconsin cheese can be improved by the employment of a State Superintendent of cheese factories, and the employment of more women as boss cheese-makers, as he finds they are more cleanly and thorough. The factory should be large enough to employ a woman cheese-maker and a man to work under her directions, and to do the rougher and to heavier work.

Mr. J. M. Thomas urged the importance of attending to all the details, no matter how good the general plans may be. No business, however well planned, will run itself. There must be constant attention from first to last. The surplus food above the maintenance ration is what the cow converts into milk. "C."

REMEDY FOR LEAKING TEATS.—If a flat India-rubber ring is put high up around the udder of a cow that drops her milk, just after milking, and kept there for a week, or longer, if necessary, it is a "sure cure." I have found it to be so a number of times. H. R.

Sheep Husbandry.

Notes from the Rural's W. N. Y. Farm

LAMB RAISING AND FEEDING LAMBS.

SUCCULENT FOOD

is extremely necessary if the best results are desired in feeding any class of sheep. It is doubly so in the feeding of lambs. Though not very well known to sheep feeders, it is a fact that when fed on a diet of corn and dry forage, it is never safe to continue the feeding of a sheep over 90 days; but with bran and oil meal mixed with the corn, the time may be safely extended 30 days. If to this diet be added a moderate daily, or even a semi-weekly allowance of succulent food of some sort, the time can be indefinitely extended and the sheep will remain in perfect health.

As before stated, in fattening but little is added to mature sheep in muscle (lean meat) and nothing in bones, the gain being almost entirely an increase of fat, and as it does not pay to carry this beyond a certain extent, they may be so highly fed as to reach this point in from 90 to 120 days, so that this may be done fairly well without green food. It is entirely different in the feeding of lambs; their gain is more than one half bone, muscle and wool, and with the proper food their growth may be continued, with very little diminution in the ratio of increase, during the whole Winter. If put into the barns in November, they may be profitably fed until May, making a period of from 165 to 180 days, so that in lamb feeding succulent food *must* be provided.

Aside from its cooling and laxative effects upon the system, green food stimulates the stomach and digestive organs to more thoroughly act upon the solid foods, and to take up and assimilate a much larger proportion of their nutritive matter, in this way causing greater gain for the same amount of food consumed. The whole carcass will be made to contain a much larger proportion of moisture; this not only adds to the weight of the carcass, but gives increased value to the animal, and greater satisfaction to the consumer, in its juiciness, so that while older sheep will do much better when supplied with succulent food, and its use will pay even with them, it is absolutely indispensable in feeding lambs.

SILAGE OR ROOTS,

which shall we use? We must admit right here that we have had no personal experience with the silo, and can therefore speak of silage only from second-hand knowledge. We have known many people to use silage in feeding older sheep; some recommend it highly, while others as strongly condemned its use. We know of but one person who has ever used silage for lamb feeding, and he abandoned it on the ground that roots were better. And then, we do not see how it is much cheaper than roots. The estimates for growing and putting it into the silo run all along from $1.25 to $2.25 per ton, and for $1.67 per ton, or five cents per bushel at the very outside, we can put mangels into the cellar; and we know just what we can do with them.

Our experience has been very extensive and of long duration in the use of the various kinds of roots, all of which are excellent in their season, as are also potatoes, and apples so long as they can be kept sound. We commence feeding roots as soon as the lambs go into the pens, and continue until they go to market.

WHAT KIND OF ROOTS

are cheapest to grow and will produce the best results in feeding is a question to be determined only by long experience, and depends considerably upon the soil. We have had good success with both English or flat turnips and swedes, with carrots, sugar beets and several varieties of mangels. We now largely depend upon English or flat turnips for feeding in the Fall and early Winter, and on mangels for late feeding; though we sometimes feed largely of swedes. We have so many inquiries as to the value of the different roots, the best soils on which to raise them, the best manure and manner of growing and harvesting each, and how to store and feed them, that we will, by and by, take these up and treat of each separately.

WHAT GRAIN WITH STRAW

and poor hay will make a complete food? Our good friend R. S. Davis, of Vermont, says he has 40 grade Cotswold ewes in lamb, with only straw and a poor quality of hay for forage on which to winter them, and he wishes to know what grain he should feed to keep them in good condition. Straw and meadow hay, and if the latter is in poor condition more markedly so, are very deficient in the albuminoids or nitrogenous elements, and as these are very essential in the food of a sheep (and especially of one bearing a lamb), for the growth of wool and also of the fœtus, we should select such grains as have a surplus of these elements. The best of all foods to mix with them, then, is cotton-seed meal (this is only theoretical, as we have had no experience with it), new-process or linseed meal, old-process oil meal, peas, beans; then bran and malt-sprouts mixed; then oats and barley. If oil-meal is used, one-half its weight may be added in corn or barley, or wheat middlings. The same may be done to advantage if peas or beans are used.

It would be a grand thing if the ewes could have two feeds of mangels or turnips, or sugar beets or potatoes every week. Corn alone is about as deficient in albuminoids as is the forage named. Bran is a capital ingredient to be included in the ration of breeding animals, as it contains so large a percentage of phosphate of lime, a thing very essential from which to grow the bones of the off-spring.

We had, January 27th, 252 young lambs, and they were still making it lively for the shepherds. We shall run somewhat over 300 this year.

January 27th we shipped the first six to market. They weighed, dressed, 35 pounds each, and sold for a very satisfactory price.

The demand seems now fairly open, and takes them as fast as we can force them into condition as to size and fatness. Up to Feb. 13th, 64 had been marketed, and we are now sending 18 each week.

It seems hard to pet and fondle the little fellows until you really come to love them, and then be obliged to take their lives. This is the only disagreeable feature in the whole business. But such is life! The stronger are always feeding at the expense of the weaker.

Farm Topics.

MARKET THOUGHTS.

So much has been said about the price of butter and the extent to which the use of oleomargarine has cut into the business, that it may be interesting to compare prices. In the New York market February 1, the best butter was quoted at 35 cents and the poorest at 11 cents. This was, of course, the wholesale price. Ten cents at least should be added for the retail price. That a fair comparison can be made, we give the prices quoted in this market for the past five years, for the best and the poorest butter.

	Jan.	Feb.	March.	April.	May.	June.
1881	31	34	31	35	24	23
	13	13	12	13	15	10
1882	43	43	48	44	31	25
	15	13	14	12	12	15
1883	44	38	42	33	31	20
	16	14	14	14	12	11
1884	36	40	36	38	31	20
	13	12	12	10	12	8
1885	31	36	36	29	27	19
	13	13	12	10	9	8

These figures show that the best grades of butter have held their own in price fairly well; but that the poorest grades have surely fallen away in value. The highest prices were reached in 1882, while the lowest were those of last year. The prices thus far this year are below those of last year, and it must be confessed that there seems little chance for improvement. Prices generally begin to drop about the middle of March. It must be remembered that city people are buying more and more butter directly from the producers. The thorough advertising which oleomargarine has received has frightened people and led them to be more careful in the selection of butter. Several families can club together and buy a quantity of butter directly from the dairy, and divide. This trade is growing in importance and bids fair to cut still further into the regular butter business.

Oleomargarine is quoted at six cents per pound, wholesale. Though thousands of pounds are handled each week, we have never seen it retailed under its proper name. It is next to impossible for an ordinary person to tell it from genuine butter. We have seen very intelligent people eat it with satisfaction, supposing that they were eating first-class butter. In many cheap restaurants and boarding houses consumers probably know what they are eating: but it seems evident that the great bulk of oleomargarine is sold and eaten as butter. The fact that the imitation is so perfect has led thousands of business men, who take their lunch in the city, to give up the use of butter when away from home. This action has injured the wholesale trade in two ways—it has actually decreased the demand for butter, and it has hastened the establishment of "dairies" or restaurants which are run in connection with a farm a short distance from the city, where the best of milk and butter can be secured. It appears evident that the increased business in oleomargarine will still further injure the wholesale butter trade. The result will be that city families will organize and buy butter directly from the country, or creameries will be established with retail agencies in the city.

The efforts to regulate the sale of oleomargarine in this market have not met with success; one section of the law has been declared unconstitutional. Plenty of arrests for offenses covered by other sections have been made, but owing to the slow process of law in this district and the influence against such prosecutions, little progress can be made. It seems likely that imitation butter has secured a permanent hold on the markets as at present conducted, and that the most successful methods of fighting it lie in organization among farmers and consumers. The most practical method appears to be the establishment of more creameries with retail branches in the cities where good butter can be sold at fair prices.

CROP NOTES.

THE best of my thoroughly tested potatoes is Clark's No. 1. The best new early is the Diamond Seedling, a new sort from Niagara County, N. Y., in shape and flavor like the Snowflake, but not quite as white-fleshed. If it does as well hereafter as it did the past season, it will be A No. 1. White Elephants all rotten. St. Patrick one of my best.

The Rural 50 kinds of corn nearly all ripened, but I did not consider any desirable.

All grapes were late in ripening the past Autumn. Iona ripened but about half the crop. Jefferson proved a great and early bearer of enormous clusters, about a week later than Concord: quality excellent. Vergennes was considerably earlier, and resembles Salem in wood and fruit. How foolish some self-sufficient persons are in ridiculing the Concord grape. The odor of the rose is offensive to some, and that of Limburger cheese agreeable to others. Of 200 persons eating grapes every day in a house near here, more than two-thirds prefer Concord to Delaware. The tenderest grape in my collection is the Hartford. It does not fully ripen its wood. Worden deserved a good word; so do Brighton and Lady, Eumelan and Agawam.

Schuyler Co., N. Y. H.

CROWS IN THE CORN-FIELD.

The way to avoid damage from crows is to hang a dead crow up in the field. One killed now, if the entrails are removed and the cavity is filled with salt, and salt is also placed in the crop and down the throat, and the carcass

is hung up and dried, will last for this purpose two years. Try it. W. H. B.
Carlisle, Pa.

REMARKS.—We have found that crows do much more good than harm. A few quarts of corn thoroughly soaked and scattered about the field just as the planted corn is coming up, will prevent all damage.

THINGS WORTH KNOWING.

ONE spoonful of coal-tar to a peck of seed corn will prevent crows from pulling up the corn.

Coal-tar will have no effect on the potato "bug." It will preserve shingles, if put on as they are laid; but pitch tar thinned with oil and mixed with paint is much better. Fifty years ago, I helped to put shingles on a roof, prepared in this way, and most of them are there yet.

Oil and pulverized charcoal will preserve fence-posts, but burning the end that goes into the ground, is the best preservative. I have some posts which were prepared in this way and set in 1862, and to-day they are just as sound as ever. N. H.

Farm Economy.

SNOW PLOW.

IN those parts of the country blessed with frequent and deep snows, it is no small chore to keep walks shoveled or cleared out. We well remember the many weary hours spent when a boy in clearing out the snow a few hours would again put back, and all the time the horses were standing idle in the warm stables, eating hay and oats.

A snow plow is quickly made, and with one and a good horse, or team when the snow is extra-deep or has got packed pretty hard, more roads can be cleaned in 15 minutes than any boy can shovel out in half a day, and with the plow it is only fun for boy or horse, unless too many roads are to be cleaned, when the horse ceases to see where the fun comes in. To make a good one, take two hard-wood boards, or tough wood will do; they should be eight or nine feet long, 18 or 20 inches wide, and one or one-and-a-half inch thick. The front ends should be cut three inches shorter on the upper than on the under edge, and chamfered on the back side so as to fit together V-shaped, and so that the rear end will be spread as much as it is desired to have the walk or path wide. A piece of 4x6 scantling, *a*, should be cut to fit into the angle between the sides at the front end, and to this the sides should be firmly nailed. One foot from the rear end a 2x6 piece should be put across from side to side, and let into both sides so as to come flush with the top. See *b*, Fig. 86.

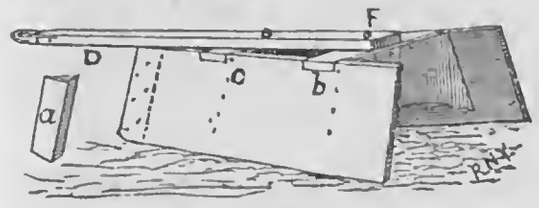


Fig. 86.

A piece of board or plank five inches narrower than the sides should next be cut long enough, and having its ends cut on an angle so as to fit closely to the sides when placed upright and close up to the cross-piece, *b*. The lower edge of this piece should be hollowed out in the middle between the sides so as not to strike any stones or frozen hubs on the ground; to this the sides and also the cross-piece should be firmly nailed. Another cross-piece and perpendicular board of the same kind, only shorter, should be put in, as at *C*. A beam should be provided, *D*. This should be 4x4 inches, and seven feet long. Its hind end should be bolted to the center of the hinder cross-piece, as at *F*. There should be a hole through this beam, where it passes over the forward cross-piece which should have three or more holes. By putting a bolt through these holes and the beam, the plow can be made to follow the team directly, throwing the snow on both sides, or be made to run angling so as to throw the snow at either side, as desired; the slant of the sides and the weight of the driver will cause the plow to run under the snow and follow close to the ground or walk.

The point should be rounded a very little to prevent it from running into the ground.

LARD PRESS.

MR. GEORGE WHITON sends us the design for the implement shown at Fig. 85. We think the women who burn their fingers and have a hard time generally over the hot lard, will look upon it with favor. A sheet-iron cylinder, A, is punctured with holes for one-third of the space from the bottom, as shown at B. A block of wood, two inches thick and just large enough to enter the cylinder, is shown at C. D is a common carpenter's bench screw, which plays through the block, which is in turn supported by two iron straps, F F, made from old wagon-tire iron. The pan, E, can be made from a six-quart milk pan. The tinner

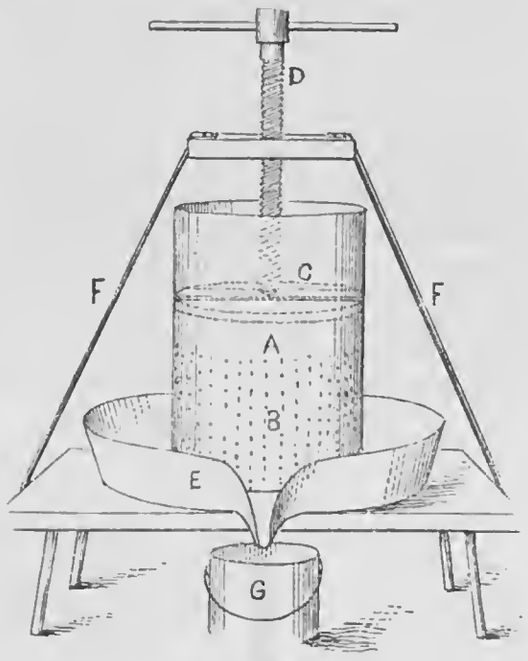

Fig. 85.

can put a spout on it, as shown. G is an ordinary pail. In use, the pan is placed as shown in the illustration, the cylinder filled with lard or cracklings, the piece of wood, C, placed at the top, and the screw applied. When the lard has been pressed out, the screw is reversed and the cracklings pushed out.

HARD TIMES DEVICES.

"NECESSITY is the mother of invention." Hard times can be looked upon as the grandparent. The walls of a new home generally look bare. There are usually plenty of unframed pictures. These can be framed at home. I give my experience as a framer. A box to fit the corners was needed. This was made, as shown in Fig. 82, from three dressed inch boards, six inches wide and 18 inches long, another four-and-one-fourth inches wide being added. The angles must all be right, and the nails driven so that they will not come in the way of the saw. The sides are divided into three equal parts, and cut down with a saw so as to form a perfect X at the bottom. With this box to prepare the corners, I took pieces of bed and crown molding, left from the house, and fitted them together. They were pine, so I oiled and added walnut stain. When the frames were dry, small strips a trifle thicker than the glass, were added to the back and finally a thin board to hold picture and glass in place. When walnut and gilt are desired, stick strips of gilt paper on the inner edge of the molding.

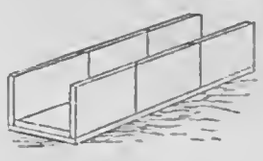

Fig. 82.

A convenient way of arranging saws on the lid of a tool chest is shown at Fig. 83. The end of the blade is put in a small pocket and the handle is held with a button. MAY BEE.

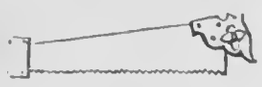

Fig. 83.

SAFE BARN LOCK.

MR. J. KRUPP, of Franklinville, Ont., Canada, tells us how he fastens his barn door. The lock proper is an ordinary sliding wooden bolt, fixed on the inside of the door. A hole, half an inch in diameter, is bored through the door two inches above the bolt. The key, shown at Fig. 84, is a piece of ordinary three-eighth inch iron with a hinge at *a*. When the key is pushed through the hole, the shorter part falls into the position shown at Fig. 2, between two projections on the bolt, so that when the key is turned the bolt is pushed into place. This lock is cheap and will be hard to pick.

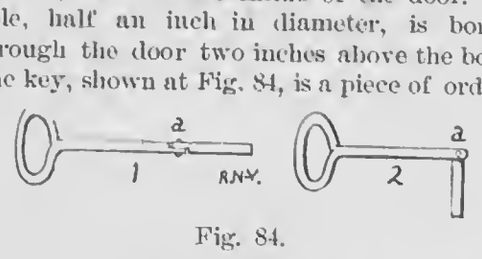

Fig. 84.

USE THE OLD HORSE-SHOES.

THERE is economy in making things live two lives. Fig. 80 shows how this principle can be carried out with respect to old horse-shoes. Mr. W. F. Woodruff, who sent us the sketch, says: "Horse-shoes may be made to do duty in a number of ways after they have outlived their usefulness on the animal's hoofs. For instance, when I discover a fence post which has split, I draw it up with a chain and

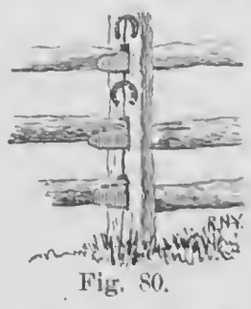

Fig. 80.

stout stick, and nail an old shoe on to hold it together.

HARNESS HOOK.

THE "hook" shown at Fig. 81 is intended, by those who have it in use, to be placed where it is not practicable to drive a pin. It is far better than the old-fashioned crotched stick so much in use. A is a piece of 2x3-inch scantling, two feet long, with a mortise at the top, into which C fits. C is one inch broad, four inches wide and 20 inches long. It is hollowed to the depth of one inch at the center. It fits in a mortise at the top of the brace B. B is made of 2x3 inch scantling, two feet six inches long. It is beveled at one end to fit at the bottom of A, to which it is nailed. The whole arrangement is spiked to the wall.

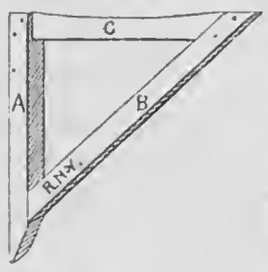

Fig. 81.

Arboricultural.

THE JAPAN CHESTNUT.

Is it larger than the Spanish? Nuts weighing over one ounce; are they from the Japan or the Spanish?

AN ILLUSTRATION TRUE TO NATURE.

THE following letter explains itself:

"We are surprised at what is said editorially on page 60 of the RURAL for January 23, in relation to the comparative sizes of the Spanish and Japan Chestnuts. We have handled a good many of both, and our impression is, and always has been, that the Japan averages much the larger, as well as being of superior flavor. We mail to the RURAL office three samples of the Japan, which weigh over four ounces. We have had some that weighed 1½ ounce each. Those we mail have been carelessly exposed to freezing and thawing, and are somewhat injured. We should not have taken any notice of the item, were it not that we had given representations of each kind in our catalogue, and if the Spanish is the larger, they are incorrect. The chestnuts forwarded were grown in Japan. We have none of our own raising that we can send. They have fruited with us in two years from grafts put in bearing trees of the American chestnut, and they have borne in the nursery row at three years from seed—the trees not being more than three to four feet high. We have at different times grown considerable fruit of the Spanish Chestnut, but every once in a while we have had a cold Winter that killed them pretty well down to the ground; but we do not know that the roots were ever injured. We think from what we have seen of the Japan Chestnuts on Long Island that they are neither as dwarf in habit, nor as large in fruit as those we are growing. We have imported a good many hundred pounds of nuts from Japan, and the average size has always been larger than that of any lot of Spanish Chestnuts we have ever seen.

Painesville, O. J. J. HARRISON."

Five or six years ago, the writer saw, for the first time, a Japan Chestnut tree. It was about six feet high and had borne fruit. A tree was ordered for the RURAL'S Experiment Grounds. It died. Another was ordered, and that died. A third lived and is now about four years old though still only a bush four feet high.

Upon inquiry, we found that several years prior to our first trial, Mr. Bruggerhof (of the firm of Thorburn & Co., N. Y.), had received and planted some nuts from Japan. Many of them fruited in three or four years, bearing nuts not as good in quality as our native chestnuts, but nearly twice as large. He now informs us that these seedling trees are about 20 feet in hight, being 10 years old. Unless deprived of their lower branches, the trees assume a bushy form, spreading over the ground and bearing fruit within three feet of it. Even when the branches are cut away, exposing the main stem, the tops still assume a bushy, round form. The nuts borne by these seedlings (see Figs. 74, and 75—p. 120) are all very much smaller than that shown entire at Fig. 76, and in half-section at Fig. 77 (see page 120).

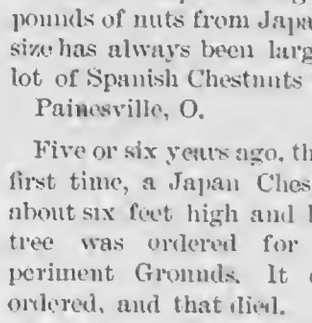

Fig. 74.

Lots of chestnuts come to this country under the names of Japan, Spanish, Italian and French; but, so far as we are informed, they are all tender in this climate except the

That Tired Feeling

The warm weather has a debilitating effect, especially upon those who are within doors most of the time. The peculiar, yet common, complaint known as "that tired feeling," is the result. This feeling can be entirely overcome by taking Hood's Sarsaparilla, which gives new life and strength to all the functions of the body.

"I could not sleep; had no appetite. I took Hood's Sarsaparilla and soon began to sleep soundly; could get up without that tired and languid feeling; and my appetite improved." R. A. SANFORD, Kent, Ohio.

Hood's Sarsaparilla

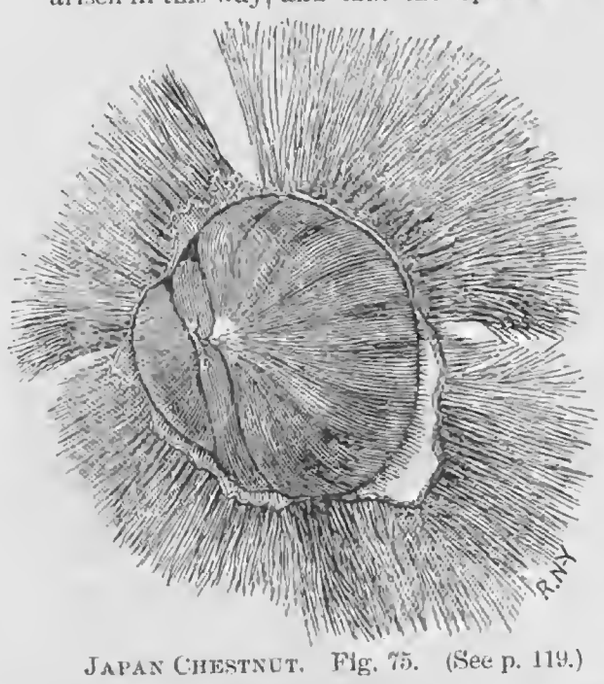
THE JAPAN CHESTNUT.

(*Continued from page* 119.)

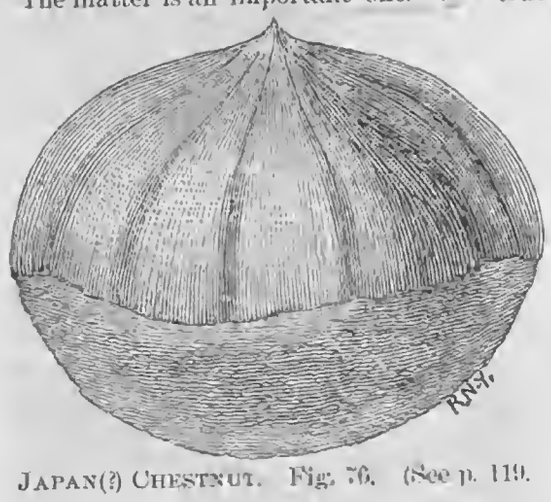
Japan, which is perfectly hardy here and, indeed, further north. Possibly confusion has arisen in this way, and that the Spanish has



JAPAN CHESTNUT. Fig. 75. (See p. 119.)

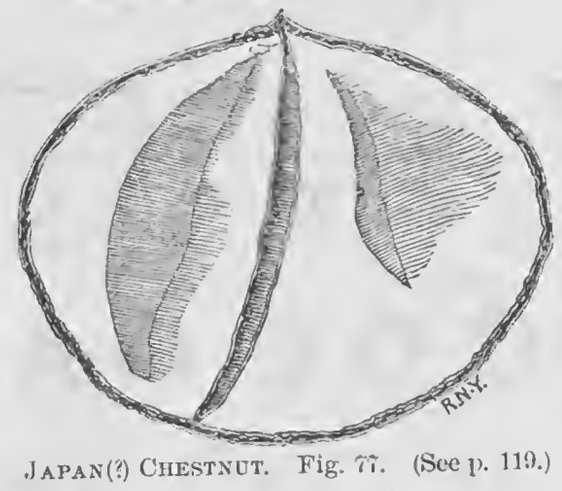
been mistaken for the Japan variety, for botanists view these different kinds as of the same species.

The matter is an important one. The true



JAPAN(?) CHESTNUT. Fig. 76. (See p. 119.

Japan Chestnut, whatever the size of its nuts, is a most valuable acquisition—valuable as an ornamental tree of small size; valuable for



JAPAN(?) CHESTNUT. Fig. 77. (See p. 119.)

fruiting within from three to five years from nursery trees, if not from seed in all cases, and valuable for the size and quality of the nuts, and, finally, for the hardiness of the tree.

Pomological.

PEARS.

GARRETT'S SEEDLING.

ABOUT July 12, 1885, we received from Mr. Franklin Garrett, of Monroe, La., a few pears. We give a cut of one of the smaller ones, as the others were not in good order owing to the great distance they had been transported: (See Fig. 78, and for a cross-section see Fig. 79.) He thinks it a chance seedling of the Le Conte and, like that, it will grow from cuttings. It is a good grower with bright glossy leaves, and is healthy and productive, and the fruit hangs very firmly to the limbs, very few being blown off even in high winds. The pears are only of medium size, and are very uniform in shape, all having the peculiarity of the elevation or shoulder on one side of the rim surrounding the stem. The stem is very long —2¼ inches—and tapers from the pear to its junction with the limb. Calyx small and closed, and in a small but quite deep basin; core not large, and with only few seeds; color a dull yellow, showing through a semi-transparent mottled skin. Where exposed to the sun, it has a beautiful red cheek. Flesh tender, quite juicy, entirely sweet to the core, with no astringency and no hard, sour part surrounding the core, even when only partially ripened. From its appearance and quality, we should think it is worthy of further trial, especially in the South.

Spring approacheth. Any of our present subscribers may secure eight plants of the Jewell Strawberry, or six plants of the Golden Queen or Rancocas Raspberry, or three of the Earhart Everbearing, by sending us *one new subscriber*. See regular Premium-list.

What Others Say.

SELF-FERTILIZATION OF CORN.—Our esteemed friend, Prof. I. P. Roberts, made a careful experiment to ascertain the effect of self-fertilization on corn. A plant was inclosed partly with glass, partly with muslin, so as to admit air, light and sun; but so as to keep out foreign pollen. Pollen in the greatest abundance was produced and covered the leaves, ear and ground with a thick, yellow dust. The ear, however, contained no kernels. This, Prof. Roberts thinks, points strongly towards the incapacity of the corn plant to close fertilize. We beg to think otherwise. We have studied this matter for a number of years and have found that, in some seasons, the pollen would mature and fall before the pistils (silks) were receptive, while in others the reverse would occur, while in still others the maturity and fall of the pollen and the receptivity of silk were simultaneous. We also found that such differences change or may be reversed according to the season from year to year. Observations one year were made upon 20 kinds of sweet corn. In most of them the silk was receptive during some part of the time that the pollen matured.

MULTUM IN PARVO.

MR. JAMES HUNTER, of Massachusetts, writes us that the Flageolet Wax Bean bears the longest pods of any of the wax beans. He does not believe there is a finer wax bean in cultivation. He says: "Try it if you want something nice."....

PUCK calls New York milk "a white lie."....

NEVER insure your life so much that you will be worth more dead than alive....

MANY of the seedsmen's catalogues advertised in the R. N.-Y. give instructions as to the formation and care of hot-beds and cold frames....

THE Farm, Field and Stockman says: Don't be fooled into sericulture by some man who has mulberry trees to sell....

THE Drovers' Journal says that a single London dealer last year sold nearly 800,000 tropical birds of gay plumage for the trimming of hats and costumes. Is not that quite too bad?

THE New York Tribune remarks that Professor Arnold has found four parts of bran, two of corn meal and one of linseed meal "very satisfactory" as a grain food for milch cows....

AFTER the hams are smoked, place them in boiling water for half-a-minute, then cover with sacks of any kind, which have been boiled in unslaked lime. Prof. A. J. Cook makes the above note in the New York Tribune..

CHILDREN leave the farm, says Mr. J. J. Thomas, because it is not *attractive*. He suggests that less money be spent on buildings and more on grounds....

MR. E. W. WOOD thinks that hillsides can be more profitably planted with apple orchards than with forest trees. The former would bring quicker returns....

MR. C. L. ALLEN, of Long Island (N. Y.), says that a friend of his had a farm of 240 acres, 140 being rough land, from which he cleared all the growth, except the chestnut, and planted locust. This is now the most profitable part of his farm.....

EVERY farmer can have a little forest of his own on land now useless, says Marshall P. Wilder, of Massachusetts.

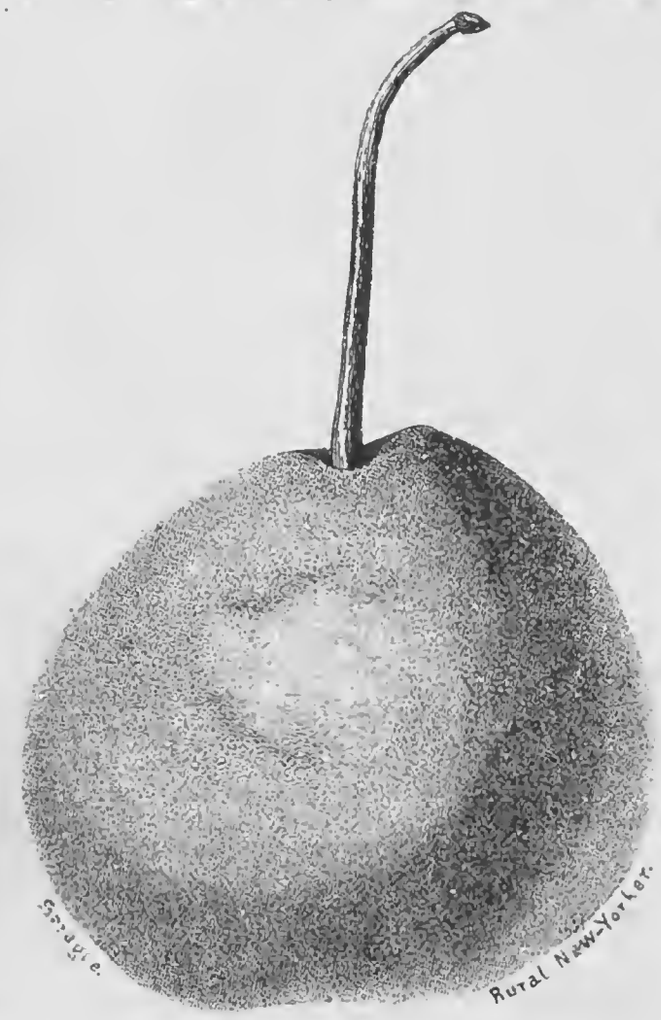
WE should have health preserved and homes fit for civilized, human beings. Forestry strikes at the root of the whole of it, says H. W. Fuller at a recent meeting of the Massachusetts Horticultural Society....

EVERY incorporated agricultural society receiving State bounty should include the subject of forestry in its annual discussions.....

MR. W. W. COLES tells the American Florist that the American Beauty is the best rose for general cultivation, introduced for over 20 years. It is a good, healthy grower and is a rose for all the year round in-doors or out. The W. F. Bennett is all that is claimed for it; but it *must have* good culture. The white Bon Silene, he says, will never become popular; it is too much of a "dirty white."...

THE same journal says that extravagant statements about the profits to be made from growing flowers are especially vicious, and, worst of all, they are sure to come home to roost....

FLORISTS complain about the competition coming from men of wealth who have made their money in other lines of trade, and who have now built vast establishments for the production and sale of cut flowers. But, pray, who is responsible for this, if not the florists themselves? Would these men have invested their money in greenhouses if it were not for the extravagant and absurd stories about the business and its profits which these same

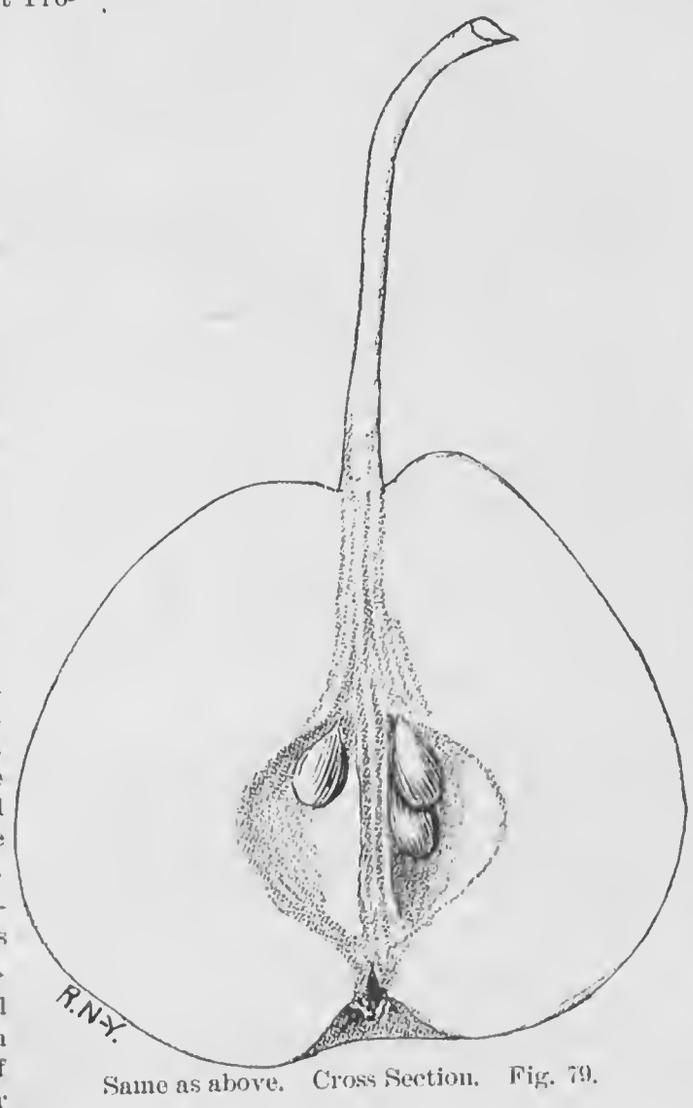


GARETT'S SEEDLING PEAR. From Nature. Fig. 78.

florists have invented and circulated, and which the daily papers in their turn have spread before the public?....

STOP the food of a fattening animal, subject it to extreme cold, and it at once begins to feed upon itself. It consumes its own flesh and fat and loses weight....

GOOD rules for the dairyman:—Low feed for ten days before the calf is dropped, fair feed for ten days following, and then big feed for ten months....



Same as above. Cross Section. Fig. 79.

MR. JOSIAH HOOPES, in the Philadelphia Press, thinks the "Reading," which originated near the city of that name in Pennsylvania, the finest of mid-winter pears. It is medium in size, yellow in color, and so attractive in appearance that, were it worthless for eating, it would be desirable for decorative purposes. We are tired of seeing varieties of fruits recommended for good looks alone. All such fruits are a positive injury to the fruit grower. What we should do is to teach people to eat more fruit, not to disgust them with good look[s] and poor quality. It is time we had done with such foolishness....

CONNECTICUT gives a State bounty of ten cents for any person planting, protecting and cultivating elm, maple, tulip, ash, basswood, oak, black-walnut, hickory, pear or cherry trees, not more than 60 feet apart, for three years, on any public highway....

BE reasonable with incubators, says the Homestead. These machines are not alive. There is something to be done besides buying them and giving them a start. You must learn all the patience, common sense and ingenuity that the hen commonly assumes.....

THE most favorable sign of Irish agriculture lies in the fact that, as compared with 20 years ago, Ireland has diminished her potato crop by one-fourth and increased her live-stock by one-third....

A "ROOT MARKET" is a feature of many English market towns. Roots are brought in and sold in loads just as hay is brought into our own markets. The annual root crop of England is enormous. It is a great help to her cattle interests....

A FARMER should be the architect of his own barn, but when he builds his house, he ought to leave the arranging of the interior to his wife. Happy is the man who has sense enough to do this....

THE frost in Florida appears to have frozen the "boom" in Florida lands as well as the oranges....

DON'T put your best days behind you. Live so that the future will always be the brightest part of life....

DE CANDOLLE states that oats will persist longer when sown by themselves than almost any other plant. The origin of the plant he locates in Eastern Europe and Tartary. Oats played a less important part in the earlier history of the race than either wheat, barley or rye. Ancient civilization was the product of a hot country. Oats did not come into important use till the stronger civilization of Northern Europe found them to be a necessary article of diet. In our own country, oats stand the third cereal in importance. The crop of 1884 was 583,623,000 bushels, against 135,000,000 in 1844. Over 80 per cent. of the crop was grown in the comparatively small space cut off by a line drawn through the southern boundary of Pennsylvania to the middle of Nebraska and then north to the British line..

GRADUALLY, says a writer in the N. Y. Times, some of the mysteries of the dairy are being cleared up, and dairymen's labors are being lightened by new knowledge. The pith of this new knowledge of the character of milk and the fat globules suspended in it is that temperature is mainly the secret of success or failure in making butter, and the difference of a degree or two in the cream when it goes into the churn is sufficient to produce a vast amount of trouble in the way of foaming cream, butter not coming, and butter not gathering....

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

DELTA, Ont.—Most of the RURAL seeds did well. Maggots injured the melons while they were getting along finely. Some of the wheat was killed out, but I got a quart of seed. I have 40 bushels of Blush Potatoes, though owing to ill-judged planting, I nearly lost all last year. Corn nearly all too late; but one yellow flint kind will do for this section. Garden Treasures fine. L.

LISTOWEL, Ont., Feb. 4th.—We are just now experiencing our cold snap with the mercury below zero. Spring wheat was a failure —only fit for chopping. Fall wheat fair, but not much of it, and the price is low—72 and 73 cents per bushel. Rough grains are also cheap, and hay only worth $7 per ton; and the low price of cheese was much felt, as this is a great dairy section; still it was as profitable as anything else. The farmers are turning their attention to bees, and have formed an association among themselves, and meet to discuss subjects of interest in connection with the little workers. A poultry association established here is also creating a greater interest in fowls and the supply of winter eggs is now about equal to the demand. The favorites are Leghorns. Fowls are being provided with warmer winter-quarters, and are better fed during cold weather. A. J. C.

MANCHESTER, Nova Scotia.—The Rural peas turned out well, especially the Prince of Wales and Stratagem. None of the Rural Union Corn ripened; but two ears of the 50 crosses matured. Flageolet Bean very productive but late. The tomatoes grew well. The King Humbert is very productive and no "humbug;" and it didn't rot like some others.

Garden Treasures very satisfactory. Black Champion Oats late; but good on good ground. D. S.

SEVERN BRIDGE, Ont.—Frosts killed all the produce of the Rural seeds, except the Prince of Wales Peas and the Blush Potatoes; the latter did extremely well, having withstood the frost long after the Early Rose and Beauty of Hebron had succumbed. It also successfully resisted bugs and rot. J. MC L.

TOUCHWOOD HILLS, Assiniboia, N. W. T.—I notice some "annexation notions" sometimes peeping out in the RURAL. Not one in 500 of our people could be tempted to entertain the idea of absorption into the grand republic south of us. As to reciprocity with you, we once had it, but your people very hastily abrogated it, much to our annoyance at the time; but the abolition of it taught us that we can get along very well without it. The only annexation we Canadians would countenance would be the annexation of the United States to the Dominion, so that they would have the advantage of "the best constitution in the world." J. M.

[Our friend must live in a super-patriotic community, if he finds the proportion of "annexationists" so very small; or else the talk of Canadians with "Americans" is very different from that among themselves. Robinson Crusoe also found he could "get along very well" without the rest of the world. Whatever desire for a renewal of the reciprocity treaty exists, is on the other side of the line. "Americans" do not seem to like a return to the former relations, as may be learnt from the tone of the recent discussions on the matter in Congress. Didn't England formerly become "annexed" to Scotland in the above way, when James VI. of Scotland became James I. of England? But the larger country at once absorbed the smaller, and has ever since been "assimilating" it. This country has a marvelous power of "assimilation." We have already "assimilated" a good deal more than the population of our dear neighbor, and the addition has been far more incongruous than the cognate race across the border. We would sooner be warm friends, however, than unfriendly countrymen.—EDS.]

TOUCHWOOD HILLS, Assiniboia, N. W. T.—This section is very new and thinly settled. Wheat, oats and barley grow well and yield bountifully. Last season, much of the grain was damaged by frost. Potatoes and turnips good. In spite of our very cold Winters, this is one of the best stock-producing regions. With reasonable care and enough wild hay, stock comes out in Spring "beef-fat." Plenty of land here yet to homestead. L.

Colorado.

FT. COLLINS, Larimer Co.—Of the product of the 50 crosses of corn I only saved one ear. This grew on a stalk eight and a half feet high, the only stalk in the hill, and ripened very early. Tomatoes and millet failures. Peas satisfactory. Beans did not prove to be even moderately good. The RURAL itself just splendid! H. S.

Connecticut.

MANSFIELD, Tolland Co.—All the Rural seeds grew well except the Johnson Grass. The corn grew all the way from six to 12 feet and yielded one bushel of sound corn. The Rural Blush Potatoes were the best of a large number of different sorts I raised. Apples were abundant here. Corn good. Buckwheat and oats fair. J. N.

Dakota.

WHITE SWAN, Charles Mix Co., Jan. 31.—In a late RURAL was a statement that much discontent exists in the frontier States and in the Territories with Commissioner Sparks's rulings in regard to land cases. I know all about land frauds in this Territory and also about the working of the Commissioner's rulings, and I am convinced that his rulings are just what is needed to check—for they can hardly put an end to—land frauds. There are fraudulent claims all over this country. Lands have been proven up, on which not a furrow of breaking was ever turned, and on which nothing was ever raised but a shanty ten feet square. When the owner had "proved up" his land, this shanty was sold to his next neighbor for a like purpose, and sometimes the shanty was built just on the division line of two claims, so that it could act as a home for both entry-men for a night or two each month, so that they could take the necessary oaths on "proving up" without fear of being indicted for perjury, and so the shanty passes from one "honest settler" to another, until it is worn out. This is only one of many forms of swindling. Most of the grossest frauds were under Republican rule; but though I am a charter member of that Grand Old Party, I believe in an honest government and an honest settlement of the public domain. W. A. M.

TALBOTTON, near Deadwood, Lawrence Co.—The Rural peas a nice acquisition. Corn too late for this climate and elevation. The Johnson Grass germinated fairly well and grew five or six feet high; roots very fleshy, and it seems likely to survive this Winter. For the beans and the King Humbert Tomato I would not take a year's subscription to the RURAL. G.

TULARE, Spink Co.—We are having an exceptionally pleasant Winter. Spink County is in the James River Valley, between the 44th and 45th parallels. I have been here four years. We have ample railroad facilities and markets, good schools and churches. The Summers are delightful and the Winters not nearly so severe as I had anticipated. Wheat, oats and barley are the staple crops, and corn and flax are raised to a considerable extent. This is a splendid country for potatoes, as they yield heavily and I don't know of a single instance of rot. This county is quite thickly settled by an energetic class of farmers from the Eastern States, New York being well represented. The country is rapidly improving, and every year the population is increased by parties from the East seeking cheap lands and business locations. Tree culture is becoming quite general, and young groves are to be seen everywhere. I raised 65 bushels of onions on one-eighth of an acre. The soil hereabouts is dark or rather black sandy loam, about two feet deep, with a yellow clay subsoil, varying from 10 to 20 feet deep, under which is found a stratum of gravel and sand, in which is found a bountiful supply of good water. We raise here mostly the hard varieties of Spring wheat, Scotch Fife being the standard. M. M.

Illinois.

WATAGA, Knox Co.—The Rural corn did not for the most part amount to much. The tomatoes were very good and very prolific. The Stratagem Peas did not come up well; but they are very large—will try them again. The Prince of Wales came up finely, and are very prolific. Beans, not snap; but very early and large. E. G.

Indiana.

PENDLETON, Madison Co.—Wheat prospect good for a full average crop. The area is ten per cent. larger than in the previous year. The corn crop was 20 per cent. larger than that of 1884. Corn worth in local market, 35 cents. The mild Winter has been favorable for all kinds of farm stock. S. W.

Indian Territory.

CADDO, February 4.—We have long summer seasons here; but the drought sometimes sets in rather early and cuts late corn very short. A great many of our farmers send north for seed corn. Our native corn is large and very fine, but late-maturing. We like our northern seed corn better after the second and third year's planting, as it is then greatly improved in size, though it matures later every season, so that more new seed is necessary. Any kind of corn grown north is earlier than ours. B. H.

Iowa.

OSAGE, Mitchell Co.—The Rural corn made a fine growth and ripened the grain. It is valuable for this section. The other seeds gave satisfaction, except the Garden Treasures, few of which germinated. L. S. E.

Kansas.

GENEVA, Allen Co.—Of the Rural corn left me by a sweeping flood, several stalks of a white, eight-rowed dent bore well. On one there were five ears that measured 34 inches. On several later stalks there were seven ears. The Johnson Grass did not come up. The peas did well. N. MCG.

Massachusetts.

HARRIS, Bristol Co.—The Rural Corn produced nine or ten distinct varieties. Some matured as early as the Angel of Midnight, and some resembled it to a dot. Ten ears were exactly like Pride of the North. The peas were fine in yield and quality. Tomatoes good, but rather small. Beans good yielders. Garden Treasures fine. There were half a dozen blades of Johnson Grass. W. B. V.

Michigan.

BATTLE CREEK, Calhoun Co.—I see by my books that during the last 30 years I have paid over $500 for subscriptions for the RURAL for myself and others, and in no instance have I had cause to regret the outlay for my own copy or those presented to others. I neither drink spirits, chew tobacco nor smoke, and am 66 years old, hale and hearty. When asked to "treat" by a farmer, I always say, "Well, I will treat you to a month or year of the RURAL NEW-YORKER," and in that way I have been paying for from five to twenty copies of the paper nearly all the time. S. C. B.

[Thanks.—EDS.]

CHARLOTTE, Eaton Co.—Two years' experience convinces me that the RURAL is the best paper of the kind in the country. The seeds were worth the subscription price. All the Rural corn got ripe, and was splendid. Of the Stratagem and Prince of Wales Peas I

THOMPSON'S CLOVER & GRASS SEEDER

WHEEL-BARROW
The only machine that will successfully sow Clover, Timothy, Hungarian, Millett, Red Top and Flax. Indispensable in windy weather when impossible to sow by hand. Simple and durable in construction. Feed positive and uniform. Send for circular describing latest improvements. Man'f'd by O. E. THOMPSON, Ypsilanti, Mich.

ECLIPSE POST HOLE DIGGER.
The Greatest LABOR-SAVING tool ever invented for digging holes in the ground. This machine works on a new principle, and is unlike anything in the market. It is neither an Auger nor a Plunger, but is driven in the ground with a driving rod, which works in a pipe similar to a telescope. We claim for this tool:
1st. That one man can dig from two to three hundred holes two feet in ordinary ground in one day.
2nd. That it will dig holes any size or depth required.
3d. That it will work successfully in very hard or rough ground where other diggers and augers will not work at all.
4th. You stand up straight while using it consequently no back-breaking work is required.
It will pay you to send for descriptive circulars and prices to COLE & FLEMING, Manufacturers, Springfield, O.

THE Original $200 Saw Mill!

1500 to 4000 FEET of lumber can be cut in a day. Built in a first-class manner. The Best Mill made. Many hundreds of these in use, giving universal satisfaction. We have the best Mills of larger sizes, Portable and Stationary. Send for circular R
LANE & BODLEY CO., cor. John and Water Sts., Cincinnati, O.

RICHMOND CHAMPION FENCE MACHINE

Patented Nov. 24, 1885.
Stands at the head of all wire and picket machines for making fence in the field, being the most complete, simple, speedy and easily operated, and having the most perfect tension device. It will weave in any kind of pickets from one to six inches wide, easily twisting a No. 8 wire, and making a fence that no stock will break down at a cost of sixty cents a rod complete. Works up or down hill or on a level equally well, keeping pickets perpendicular. Light and easily handled. A boy can work it. Every farmer can afford to own one. Write for circular and price.

SEDGWICK STEEL WIRE FENCE

Is the best general purpose wire fence in use. It is a **strong net-work without barbs.** Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is better than boards or barbed wire in every respect. Give it a fair trial; it will wear itself into favor. The **Sedgwick Gates** made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working **all-iron automatic or self-opening gate,** and the neatest cheap iron fences now made. The best **Wire Stretcher, Cutting Pliers and Post Augers.** For prices and particulars ask Hardware Dealers, or address, mentioning paper,
SEDGWICK BROS., Richmond, Ind.
EDWARD SUTTON, Eastern Agent, 300 Market St., Philadelphia, Pa.

(*Continued from page 121.*)

have three quarts each—very excellent peas. Of the beans I have four quarts. The tomatoes and flowers were fine. Crops here were good. Wheat, 25 bushels per acre, worth 85 cents; oats, 50 bushels, worth 30 cents; corn, 80 to 120 bushels, worth 25 cents; potatoes, 100 to 480 bushels, worth 35 cents. Stock in good condition. Sheep are being picked up close, worth $1.50 to $4.00. Cattle are neglected. Hogs worth $4.00, dressed. W. A. C.

Montana.

PHILBROOK, Meagher Co.—The Stratagem and Prince of Wales Peas were splendid; pods very full; peas quite sweet. The beans and tomatoes were killed by frost June 14th. The Johnson Grass did not come up well and did not grow very fast; it spreads out on the ground too much. The Rural corn came up nicely, but the seasons are too short here for corn to do any good except the earliest kinds. On the Rural corn there was not a single setting when the frost came. The Garden Treasures were satisfactory. H. M.

New Hampshire.

NASHUA, Hillsboro Co.—The RURAL seeds came up and did well. The tomatoes were beautiful, and we also had a lot of the Flageolet Beans. We are new beginners in farming and are anxious to make the business a success, and could not get along without the RURAL. J. P. D.

New Jersey.

ORANGE, Essex Co.—The Rural Peas were fine and the beans were most prolific. F. J. O'N.

New York.

AFTON, Chenango Co.—Rural peas quite satisfactory. The beans did very well, though the season was too wet to give them a fair chance. The tomatoes grew nicely and bore well; but didn't ripen ditto, and rotted badly on account of the excessively wet weather. T. H.

BENSON, Hamilton Co.—I harvested a quart each of the Thousand-fold Rye and Diehl-Mediterranean Wheat—both first-class. The cross-bred corn grew well; but most of it is too late for this section. The peas very fine. Flageolet Beans didn't do well. Garden Treasures nice. D. W. C.

PECONIC, Suffolk Co.—On the whole, I have had very good luck with the Rural seed. Some I have given up, because I had better of the same kind; but the good ones have more than repaid me for the trouble and expense for all. Of the last Distribution, for instance, the Thousand-fold Rye was first-rate; but the corn ran too much to stalk. As we use the stalks for fodder, we want leaves, not cord-wood. W. A. H.

Ohio.

FREMONT, Sandusky Co.—Owing to excessive wetness of the ground, most of the Rural wheat was winter-killed; what survived did well. So did the rye. The King Humbert Tomatoes were late; the Bi-colors were nice. The Flageolet Beans yielded well. What peas came up well, were good. The Rural Corn is not as well adapted to this section as some other sorts. Garden Treasures very satisfactory. The Beauty of Hebron has been the favorite early potato with us ever since we obtained it from the RURAL. J. D. M.

HILLSBORO, Highland Co., January 31.—The Rural Peas were splendid, especially the Stratagem. The tomatoes did not amount to much—too small. Rye and wheat nice. Flageolet Beans not extra. The Garden Treasures were very fine. We had a very open and delightful Winter until after New Year's. The mercury then fell to 18 degrees below zero. Times dull and money scarce. Stock and produce are low, but the outlook is somewhat promising. Corn was a good crop. Wheat was almost a failure. Wheat that was sowed looks *very* well. Success to the RURAL! N. B.

SPRINGFIELD, Clark Co.—The Rural Tomatoes did not prove desirable. The King Humbert was very little or no improvement on Nesbitt's Victoria. The Stratagem and Prince of Wales Peas were fine, but of the two I prefer the Stratagem which is very fine and large. The Flageolet Bean did well. The Sorghum halapense, sown in May, came up well and grew from four to five feet tall. I did not cut it, but saved some seed. The corn was planted in a square plot in a field of Clark County White and Golden Beauty Corn, so it was well mixed; but I did not consider it of any special value. The season is not long enough here to grow the heavy-yielding varieties, such as Golden Beauty, Chester County Mammoth, etc. Leaming does well. Henry Ward Beecher was right when he said: "To have the RURAL once is to want it always." N. W. L.

SANDUSKY, Erie Co.—I think my seeds worth all the paper cost last year. I planted one bushel of Blush Potatoes and got 25 bushels. Not any Johnson Grass came up. The Flageolet Beans all blighted. The peas did well; my wife had some splendid flowers from the Garden Treasures. The Humbert Tomatoes were very poor. W. R. C.

WEST POINT, Columbiana Co.—The Diehl-Mediterranean Wheat was entirely destroyed by the Winter, not a single stalk remaining. Nearly all the wheat hereabouts was winter-killed. Wheat is worth $1 per bushel; corn 50 cents. Prices of most products are low. M. E. C.

Pennsylvania.

CORRY, Erie Co.—The Garden Treasures gave such satisfaction as to compensate for the failure of some of the other seeds. The tomatoes looked nice, but the frost caught them. Peas good, but did not yield as well as some other kinds. W. O. P.

LACKAWANNA Co.—The Stratagem Peas are an acquisition, although the Prince of Wales yielded the most seed owing to so many of the former failing to germinate. The King Humbert Tomatoes were great yielders if numbers count anything. Don't think they would be missed. Was in hopes the Flageolet Beans would be what were wanted, as I am very partial to Limas, but they don't come within talking distance of the good, old-fashioned Limas, so will have to cut poles a while longer. The Horsford Market Garden Peas yielded well and were of good quality, but won't take the the place of the American Wonder. The Garden Treasures were fine. M. C.

NEW ALEXANDRIA, Westmoreland Co.—Whoever saw the plants from the Rural seeds last season, said they alone were worth the price of the paper. Here the Flageolet Beans will take the place of the Lima, as they are more easily cultivated and finer in flavor. The Prince of Wales and Stratagem were of extraordinarily large size and of good quality—certainly first-class garden peas. The King Humbert Tomato has been so derided everywhere, that in pity I shall not say a single word about it. Some of the cross-bred corn ripened and will get another chance. The Garden Treasures delighted us during the entire Summer. H. M. F.

Texas.

MERCER'S GAP, Comanche Co.—The Rural Corn would have done splendidly were it not that the hogs took such a fancy to it that they stole it all. The tomatoes did well. Everybody likes to get some of the seed. The Flageolet Bean did finely. J. H. W. B.

Washington Territory.

COIN, Whitman Co.—I have about six quarts of the Diehl-Mediterranean Wheat. The tomatoes were nice. The peas did well. I have about a peck each of the R. N.-Y. and Market Garden Peas. The oats did pretty well. The Garden Treasures were not as good as usual. W. A. J.

POMEROY, Garfield Co.—The cross-bred corn is of no account in this country. The King Humbert Tomato is a humbug, as it is the old Pear Tomato re-named. The Flageolet Beans are not adapted to this climate and soil, hence they were poor. The peas were all that was claimed for them. The Diehl-Mediterranean Wheat was all that was claimed and produced more than a gallon, which will be sown. The Thousand-fold Rye was not sown till last Spring, and hence is not matured. The Black Champion Oats do not promise much thus far. The season was too dry for the Garden Treasures. A. O. H.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time.]

CEMENT WATER-PIPE.

W. B. H., Como, Montana.—1. I wish to lay a pipe for water from a spring to a house from 300 to 350 feet distant; the head will be about 10 feet. Iron pipe costs, for 1¼ inch, 25 cents per foot; can I use cement of any kind? 2. What should be the proportion of cement to sand, and what would be the proper thickness to sustain the pressure?

ANS.—1. Cement makes a capital pipe for such use, and when once laid lasts forever, unless destroyed by frost. 2. If the cement is good and the sand clean (free from dirt or loam), one part of cement to two of sand will be ample, and with this mortar, when mixed, half as much more coarse gravel may be worked in. Make the pipe two inches inside; have a stick turned true and six feet long, and a half inch larger at one end than at the other, for a core to be used in forming the pipe or bore, and thoroughly soak it in linseed oil and dry it before using. Dig the trench deep enough to be below frost and six inches wide at the bottom. Commence at the upper end; throw in two inches of the cement and be sure that it is compacted, so as to have no air holes in it; on this in the center, place the stick for a core, large end down. Apply enough of the cement to fill the trench to a depth sufficient to cover the core two inches deep, working all down until solid and free from air-holes. When the cement has firmly "set," move the core slightly so as to loosen it, and after a little withdraw it, leaving about six inches of the smaller end in the cement already laid. Apply another lot of cement as before, being careful to have it well joined to the part already laid, and that all bubbles of air are worked out. When a day old, each part should be covered two or three inches deep with soil, being careful that no stones are allowed to fall on, or crush it. At the lower end, connection should be made with the cement pipe by a lead pipe of the same size outside as the bore, having two or three flanges 1½ inch larger than the pipe, and be sure that the cement is packed closely all about them. In one month, let in the water, and if all is sound, fill the trench, packing the earth solid. If well done, it will last longer than you and your children will live.

AN AILING HORSE.

F. K., Rochester, N. Y.—1. After driving my horse three or four miles, he acts as if he couldn't go any further. If I continue driving, he will sometimes stop very suddenly. His flesh on the hind-quarters twitches, and if driven too long without stopping, he sometimes turns his head to one side, shakes it, and nearly falls down. The spells soon pass off if he is allowed to stop and then move slowly for a few minutes. They trouble him after traveling the above distance, and not at other times, and are least severe when he is on pasture. What ails him? 2. What would be the fittest feed for him? 3. What medicine does he need?

ANSWERED BY F. L. KILBORNE, B.V.S.

1. If the condition is due to heart disease, as is very likely the case, a cure cannot be expected. 2. A laxative diet at all times. During the summer months, it should consist largely of grass or other green food with grain, according to the needs of the animal; in Winter, roots or vegetables with a moderate allowance of good hay and grain. Oil meal or cotton-seed meal will also be excellent. An occasional laxative—aloes or Glauber salts—may also be desirable during the Winter if the bowels do not move freely. 3. Give five or six drams of Barbadoes aloes to unload the bowels; and then, thrice daily for several days or a few weeks, two drams each of potassium bromide and chloral hydrate. Examine the collar to make sure that it does not press upon the great veins of the neck. It should be large enough to sit well back on the shoulders. In many cases of this kind, medicinal treatment is of very little use, and nothing can be done except to feed cautiously. Avoid all violent exercise or over-exertion, and give special attention to the general comfort of the animal.

ABOUT CALIFORNIA.

W. P. K. (address mislaid).—1. Are there chills and fever in the Golden State? 2 How would poultry raising do there? 3. How about bees? 4. Is lumber cheap?

ANS.—1. There are no chills and fever anywhere within the range of the sea breezes on the Pacific Coast—say 100 miles inland. 2. Fowls and eggs bear a much higher price in California than in the Atlantic States. The prices of eggs range from 20 to 50 cents per dozen, and fowls sell for from $4.50 to $8.00 per dozen. There seem to be as little risk and expense in growing poultry there as in New York State. The high prices are a relic of the flush times of gold mining. 3. Bees do exceedingly well all over the State. Very large exports of honey are sent to the East every year. The favorite ranges are chiefly in the hills covered with wild sage or chemisal, overlooking the plains. At all seasons some portion of the bee pasture is good for foraging. With the early rains of Winter the face of the earth is carpeted with grass. During the Spring months—February, March, April and May—the landscape is bright with flowers. Then the chemisal—made up of many sorts of shrubs, growing wild in dense thickets along the slopes—is almost continuously in blossom. Honey made from these flowers is quite fragrant. We have seen as many as 90 stands of bees in one apiary in Los Angeles County. 4. Yes; lumber is plentiful and cheap. Whether a man would succeed better there in poultry and bee raising and truck farming, than near New York City, is a question we don't care to answer. There is more in the man than in the land.

CRACKING OF GRAPES.

J. F. T., Brantford, Conn.—1. Of ten varieties of foreign grapes I grow in a cold grapery, the following cracked so as to be useless last season: Trebbiano, Chasselas Musqué, Black Hamburgh, Muscat Hamburgh and Muscat of Alexandria. They did well till the end of July, when six weeks of cold, wet weather set in: was this the cause of their cracking? 2. Would a boiler and hot water pipes be beneficial if put in early in the Spring?

ANS.—1. Without a more definite knowledge of the condition of your vines and the circumstances of their cultivation, we cannot say definitely what causes your grapes to crack. An unusual and long-continued soaking of the border, especially if succeeding a dry spell, and at a time when the berries had about attained their full size or were beginning to color, would be reason enough to cause them to crack. The evil lies, probably, in an ill-drained border. 2. A hot-water heating apparatus might not overcome cracking if the evil exists in the border, but it would help the grape crop in other ways. By a judicious use of it you could greatly assist your vines in breaking evenly, when they would be in flower, help them to "set" well, assist them through the "stoning" period, and when they begin to color, help them to ripen well and thoroughly, color well and assume a deep bloom; also in the case of immature wood you can greatly assist in ripening it by means of fire heat and ventilation at the same time.

COW WEAK IN HIND PARTS, ETC.

J. L. W., Liverpool, N. S.—1. When my cow lies down she has hard work to get up. She gets on her fore legs well enough; but her hind parts fall over, so that often she has to be helped to rise. The trouble seems to be in her loins; what ails her? 2. What is the best work on diseases of cattle?

ANSWERED BY F. L. KILBORNE, B. V. S.

1. Without knowing anything of the condition of the cow, we cannot very well prescribe for her. If she is heavy with calf and very thin in flesh, as is too frequently the case at this time of the year, probably all that is necessary is more generous feeding and a little extra care until after calving when, as the condition improves, the weakness will disappear. An excellent feed is made by mixing equal parts of ground oats and corn-meal, which may be added one-half part of wheat bran if you like; feed four quarts twice daily and as much good hay or corn fodder as the animal will eat; also a daily allowance of oil-meal or roots if convenient. See that the stable is clean and dry, the floor laid so that the cow does not slip backward in rising, and the animal made comfortable with plenty of bedding. If the cow is in good flesh and the condition is due to slipping or other injury, a mild blister of mustard and turpentine, applied to the loins, may prove beneficial. 2. The answer to this question depends somewhat upon the special purpose for what the work is intended. For a farmer who wishes to make himself familiar with some of the more common ailments of his stock, together with their proper treatment, probably the best work is the Farmer's Veterinary Adviser, by Dr. James Law, of Cornell University, Ithaca, N. Y. Price $3.00, to be had of the author.

SWELLING OF HORSE'S LEG.

J. S., Fort Howard, Wis.—Last harvest, one of the hind legs of a mare became so swollen that she became quite lame. The swelling at first reached only to the hock, but soon extended to the udder and along the belly. After treatment she got quite well for a time; but the trouble has returned. Her belly is hot and painful; she is crippled all over. When she walks, the stiffness becomes less; when she stands, it is worse. Her appetite is good. What should be done for her?

ANSWERED BY F. L. KILBORNE, B. V. S.

Bathe the swelling with tepid water in which there is dissolved one dram of chloride of zinc to each quart of water. Internally give, thrice daily, two drams each of chlorate of potash and niter and one-half ounce each of powdered cinchona bark, gentian and ginger. If there is any costiveness, add one dram of Barbadoes aloes night and morning until relieved. The stable should be clean, dry and warm, but yet well ventilated. Allow a little moderate exercise daily whenever the weather is suitable and the animal has recovered sufficiently to be able to move comfortably. Unless the mare is in very good flesh, a few quarts of grain with a pint of linseed meal daily will also be beneficial.

"STOCK" LEG IN A HORSE, ETC.

W. T. W., Hays City, Kans.—I followed the directions given in a late RURAL for the cure of "stock" leg in a horse; but the frogs of both hind feet are still ragged and split into scales; what should now be done? 2. On the lower point of the shoulder of one of my horses there was a swelling which I removed with a lan-

ment, but a hard lump still remains under the skin; what is a cure?

ANS.—1. You should have continued the medicine for several days or longer. The cure of a case of this kind cannot be expected in two or three days. As many weeks may be required. Try the following prescription twice daily: One dram each sulphate of iron and aloes, oes, one-half ounce each of gentian and niter and one-half dram of potassium iodide. Continue for two or three weeks or until the swelling is reduced. If a permanent thickening then remains, apply tincture of iodine to the swelling every four or five days. Do not forget the laxative diet and moderate daily exercise. 2. Paint it with tincture of iodine every three or four days for a month. If this does not succeed, the lump must be cut down upon, and removed through a vertical incision in the skin. Then bring the edges of the skin accurately together with white silk, and treat as an ordinary wound.

LAME LEG IN A SOW.

T. H. W., Princetown, Ind.—One of my sows has for some time been lame in one of the hind legs. She walks as though it were a wooden leg without a joint, and limps very much. The leg is swollen; what is the matter?

ANSWERED BY F. L. KILBORNE, B. V. S.

From so brief a description, it is impossible to say definitely what is the trouble. Probably the sow has sustained some sprain or injury to the shoulder or elbow. Manipulate each joint of the limb to ascertain the seat of lameness. If there are heat and tenderness, apply fomentations; in their absence, apply a blister of cantharides one part and turpentine four parts. Unless it is very desirable to keep this sow for breeding purposes, she can most profitably be turned in to the butcher, if there is not a speedy recovery.

Miscellaneous.

R. W. S., Elmer, N. J.—Mills in our vicinity have recently added machinery for reducing the cobs of corn to meal, making corn-and-cob meal; is there any benefit in feeding corn-and-cob meal over feeding the corn meal mixed with bran or with cut hay?

ANS.—Chemically there is considerable nutriment in corn cobs; mostly carbohydrates or fat and heat-formers, but it is in a very indigestible form, and unless ground extremely fine, would be practically unavailable as animal food. We have tried corn-and-cob meal many times, and have yet to be convinced that it will pay to use the cob-meal to dilute the richer foods, in place of bran or cut hay, or cut straw, even. The experiments made by Prof. Shelton, while clearly showing that corn-and-cob meal produces better results than the same amount of corn meal without the cobs, do not tell us the true reason, which probably was because of the more extended condition of the corn meal when mixed with the finely-ground cobs. We should like to see a series of extended experiments substituting bran in place of the cob meal. We believe these would clearly demonstrate the wisdom of such a course.

G. H. F., Morley, Mich.—My four-year-old horse is perfectly sound and well, but he cannot eat hay. He chews it up and spits it out. He eats oats and corn in the ear; he doesn't seem able to grind hay, cut or otherwise. Nothing in his mouth appears wrong. What is the matter?

ANS.—Some of the molar teeth are either overgrown or diseased, or there is some foreign body or growth in the mouth or throat. With a plow-clevis between the jaws, or by carefully withdrawing and holding the tongue to one side, hold the mouth open and make a thorough examination, especially of the teeth and back part of the mouth. Any overgrown or diseased teeth must be rasped down or extracted, and a foreign body or growth be removed.

M. A. B., Weston, Oregon.—Why is it that in some countries—Texas, for instance—a deep furrow is plowed and this half-filled with straw, and the potatoes planted on top of this and then covered?

ANS.—The only reason we can see for using the straw in this way is that it may become saturated, and by holding the moisture keep it for the use of the potatoes in a severe drought. We think that the RURAL's trench-mulch system—that is, placing the straw above the potatoes—would give much better results. At least, it is worth trying.

J. C., Macksville, Ind.—One of my cows spits up her food. She eats heartily, looks well, chews her cud and hasn't fallen off in her milk yield; what's the matter?

ANS.—The dropping of the food is probably due to overgrown or irregular teeth. Examine the teeth carefully, and if any such are found, they must be cut or rasped down. If the teeth are perfect, examine the mouth and throat for sharp-pointed, foreign bodies which may have become partially imbedded in the flesh.

H. S. T., Williamsport, Pa.—From a setting of what I bought as Wyandotte eggs, I raised two chicks; one has a single comb and two clean legs, the other a double comb and feathered legs. Which is a Wyandotte?

ANS.—Neither. The chicks should have double combs and clean legs.

H., Bennett's Corners, N. Y.—How does the Primate Apple compare with the Oldenburg and Red Astrachan for family use?

ANS.—It is an early autumn apple of the best quality; the others are summer apples of medium quality.

H. E. K., Nickel Plate, Ind.—Could wild grapes growing thickly in timber be used as stocks for choice cultivated varieties, so as to convert a wood into a vineyard?

ANS.—No, it would be unprofitable—impracticable.

J. K., East Milan, Mich.—Where can I buy the Angel of Midnight Corn?

ANS.—Of Joseph Breck & Sons, Boston, Mass.

"New Subscriber," Emery, Ill.—T. V. Munson, Denison, Texas, can probably furnish pecan trees. Like all other hickories, the pecan does not transplant well, and should be removed from the seed-bed when one year old. The tree grows along river bottoms from Central Illinois to Texas.

Joseph Cauchon, Northwest Territory, Canada, asks where can he get an incubator suitable for hatching 100 eggs.

E. P., Suffern, N. Y.—Write for information to the Pacific Rural Press, San Francisco, Cal.

H. S., Limesville, Ohio.—Fay's Manilla Roofing is a good article—not a humbug.

DISCUSSION.

PRESERVING POST, ETC.

H. E. K., NICKEL PLATE, Ind.—In a late Farmers' Club, in answer to J. D. F., Salem, W. T., the RURAL recommends to boil the posts in tar, etc. As I devoted years in studying the preservation of timber, I beg to present the following suggestion in connection with the all-important matter of the preservation of timber used upon or under the ground, in water, or in such other ways as subject it to unusual risks of decay, such as effect not only fence posts, but sills for dwellings, barns, the posts, floors, or planks used as walls in a bank barn, telegraph posts, railroad ties, etc. Of the numerous preparations for preserving timber, chloride of zinc, which was known as an antiseptic in ancient times, and has been known as a wood preserver for 47 years, is the cheapest and most efficient. It is applied to the green log, in a very dilute form, say 1 part to 100 parts of water. By forcing the sap out of the cells with the solution, the albumen is partly coagulated, the fermentation checked, and a solid mass insoluble in water is formed, after the wood is seasoned. I have seen pine railway ties thus preserved, which had lain under the track for 27 years: the wood was perfectly sound. This process is simple and the cost of impregnation will vary according to the softness of the timber, from two to three cents per cubic foot.

J. W. K., DENTON, MD.—In a late RURAL, G. H. of Penfield, N. Y., in discussing commercial fertilizers, asks, "Did you ever know of commercial fertilizers benefiting a crop raised upon limestone land, upon which the natural timber was oak and chestnut?" Now I would like G. H., or any other subscriber to the RURAL, to state positively and without any possible probability of error, whether he has seen or knows of any limestone land on which chestnut grows naturally like oak and other kinds of timber. My reason for asking this question is, that I have repeatedly seen it stated by writers trained to careful and exact observation, that the chestnut is never found growing naturally on limestone land; and during the last five years I have taken some trouble to find an exception; but I have yet to find a single instance. Sometimes I have found chestnut bordering closely on limestone, but when I felt most sure of finding it on the limestone, there was invariably a sudden change from limestone to slate, the chestnut being always on the slaty side.

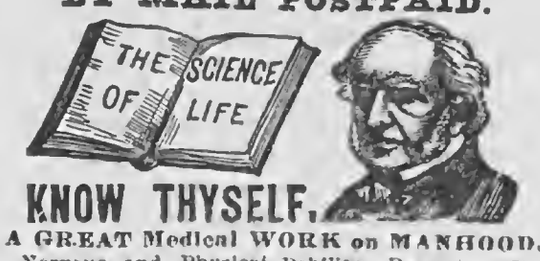
THE SCIENCE OF LIFE. ONLY $1.
BY MAIL POSTPAID.



KNOW THYSELF.

A GREAT Medical WORK on MANHOOD.

Nervous and Physical Debility, Premature Decline in man. A book for every man, young, middle aged and old. It contains 125 prescriptions for all acute and chronic diseases, each one of which is invaluable. So found by the author, whose experience for 23 years in such has probably never before fell to the lot of any physician. 300 pages, bound in beautiful French muslin, embossed covers, full gilt, guaranteed to be a finer work in every sense—mechanical, literary and professional—than any other work sold in this country for $2.50, or the money will be refunded in every instance. Price only $1.00 by mail, postpaid. Illustrated sample 6 cents. Send now. Gold medal awarded the author by the National Medical Association, to the officers of which he refers.

The Science of Life should be read by the young for instruction, and by the afflicted for relief. It will benefit all.—*London Lancet.*

There is no member of society to whom The Science of Life will not be useful, whether youth, parent, guardian, instructor or clergyman.—*Argonaut.*

Address the Peabody Medical Institute, or Dr. W. H. Parker, No. 4 Bulfinch Street, Boston, Mass., who may be consulted on all diseases requiring skill and experience. Chronic and obstinate cases that have baffled the skill of other physicians a specialty. Such treated successfully without an instance of failure. HEAL ALL THYSELF

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
E. S. CARMAN, Editor.
J. S. WOODWARD, Associate.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, FEBRUARY 20, 1886.

IF the number on your address label is 1882, your subscription expires with this number; if 1883, next week; 1884, in two weeks, etc.

Subscribers of the RURAL *need never take the trouble to write us to "stop" the paper. It is invariably discontinued at the expiration of the subscription term, except by oversight, in which case it is our loss.*

MR. JOHN THORPE writes us that some seedling Japan Chestnuts he has handled varied as much as seedling apples, with a very large proportion of crabs.

SPECIAL.

ALL orders (applications) for the Rural's present Seed Distribution received *prior* to Feb. 8th, have been mailed. Those who have not received them will please notify us by postal card.

LET us say to all that the RURAL of November 14th, 1885, gives a full illustrated description of our Free Seed Distribution, together with a full list of the $3,300 worth of presents to be sent to subscribers (and to them only) who secure clubs for the RURAL NEW-YORKER.

EVERY one who loves hash, mince pies, or sausage (and who does not when they are made of meat *chopped*, not *mashed*), should have an Enterprise Meat Chopper. We have used one now for years and know that it is all that can be desired. The No. 22 *chops* two pounds per minute, and we will send it to any one for only four subscriptions. We ought to have calls for more than a thousand. No one will regret the time he spent in securing one.

WE have received from Luther Burbank, of Santa Rosa, Cal. (Feb. 11), five Japan Chestnuts which average five inches in their widest circumference. These are large specimens of what we have always supposed to be the Japan variety, and they differ materially in shape from the Spanish, so much so, indeed, that it is easy to separate both kinds when they are mixed together. The Japan may be described as in shape an enlarged American chestnut, while the Spanish is more angular—less conical.

WHEN Pringle's Hybridized Hulless Oats were first offered, about five years ago, we purchased enough of them to sow a small plot beside the old Chinese Hulless. We judged them to be the same. There was no evidence of crossing, much less of "hybridization," as the RURAL uses this word. This displeased the introducer. Mr. Pringle, the originator, replied that he was surprised that the RURAL could see no difference. Now, the N. Y. Experiment Station, after two years' trial, pronounces them the same.

A FRIEND who has had occasion to use the Ideal Fountain Pen almost incessantly for three months, remarked a few days since, that he would not sell it for $50 if he could not procure another. The No. 2 size, worth at retail $4, is offered for four subscriptions. It will be sent in a substantial case, prepaid, in a registered letter, and be warranted to fit the hand. These pens, which are warranted in every way, may be seen and examined in almost any book store. It will then appear that the best way to secure one is by getting up a little club for the RURAL. Every farmer, every farmer's wife and daughter should have one.

THOSE whilom noble rangers of the Plains—the buffaloes—once so very numerous that, when moving in droves, the sound of their tread was like distant thunder, are about exterminated, it being estimated that not 500 are left in the whole country. Though most of the lands once fed over by them, are being occupied by herds of domestic animals, one cannot but regret the wholesale slaughter of those noble beasts. With proper regulations as to their slaughter, there are thousands of acres amid the mountain ranges where immense numbers might have lived and thriven for many years. But man's wanton cruelty in killing game for mere sport (?) has so reduced their numbers that a year or two more must see them extinct.

IN addition to the long list of special articles already announced to appear in the RURAL during 1886, we have now to add, first, articles from the pen of Pres. J. M. McBryde, of the South Carolina College, upon *Phosphates versus Acid Phosphates*, and *Notes on Bermuda and Other Southern Grasses;* and, second, several articles from J. B. Armstrong, of California, embracing *Grain-growing, Under-draining, Manuring, etc.*, and *some experiences with orchards; planting, pruning, grafting, etc., with reference to soils.*

THE recent exhibition of poultry at the N. Y. Fancier's Club was an excellent one. There has been a wonderful advance in poultry breeding during the past 20 years. The business has never been overdone, and it seems almost impossible to crowd it into the conditions which dairying and wool-growing all too frequently assume. The consumption of eggs increases from year to year, and it is impossible to counterfeit them. The sale for thoroughbred poultry is on the increase. Of all farm stock, the poultry can be most easily, cheaply and rapidly improved. At the late show, so far as numbers were concerned, the Wyandottes led, with the Plymouth Rocks a close second. All breeds were well represented, and the fact was made more apparent than ever that no one breed can satisfy everybody. All have superior points, and the selection must depend upon the location and one's love for the business. We shall show ere long some of the best birds on exhibition.

WHEN a good general is not engaged in active campaigning, he is always looking over his forces and putting everything into the best of order. The same should be the case with the farmer, and now is the time to see that every implement is in perfect condition. Thousands of dollars are annually lost by neglect of this matter. Often the seeding of a field of grain is not completed when the rain comes, only because of a little carelessness the drill did not do its best work and a delay was caused, and a rain sometimes delays the seeding days and weeks, thus making the crop late and lessening the yield. On many farms the shortage of crops, caused by late sowing, and the loss by delayed harvests, both largely the results of the implements not being in the most perfect order, would not only keep all farm tools in perfect condition, but go far towards buying new ones. If any thing on a farm ever paid compound interest, it is the putting of every tool and implement in "apple-pie" order during the Winter. To be forearmed is to be well armed!

ANNOUNCEMENTS.

IT is with much pleasure that we may now announce that the next picture to adorn our portrait gallery will be that of the RURAL'S respected friend and long-time contributor, Mrs. Mary Wager-Fisher. Mrs. Fisher is one to shrink from such publicity, and she grants our request only after repeated solicitations. A very interesting sketch of her life is written by herself.

OVER a year ago, a project was broached in the Canadian Northwest to construct a railroad from Winnepeg to a point on Hudson Bay near the mouth of the Nelson River. The original purpose of the road was to connect with a line of steamers designed to carry the grain of Manitoba and the Northwest Territory to Europe through Hudson Straits; but the hard experience of the Alert last Summer disclosed that this would be a hazardous route at most times. The projectors, however, seem determined to have their road any way, mainly, it would appear, because the country is so admirably adapted for track-laying that the line will cost only $20,000 a mile. The local business is now almost nothing; but it is hoped that the road, when built, will develop the country. Haven't our Pacific railroads done so? Work is to be begun when the snow clears off; and it will at any rate bring workmen and money into the Northwest—and workmen and money are just the things wanted there.

WHY not have a fat stock show at the East? Are not the consumers of beef interested in the cheap production? Why should these great shows be held for the benefit of producers alone? The great market for the surplus Western beef is at the East. The New England States, with New York, New Jersey and Pennsylvania, contain over 20 per cent. of the total population of the country. They have but 13 per cent. of the total number of persons engaged in agriculture, but over 60 per cent. of the persons engaged in manufacturing. These States have of all kinds of cattle 7,000,000, while the whole country has over 40,000,000. These figures show what an immense meat bill these States are called upon to pay. A series of fat stock shows held at the East might work a benefit in two ways—they might do much to overcome the prejudice that at present exists, in some quarters, against Western beef, and they would surely stimulate our Eastern farmers to increased efforts in beef production.

FOR some years, the southern termini of five railroads have been just on the northern border of the Indian Territory. All this time, the companies have been waiting impatiently for an opportunity to push their roads through the Territory to tap the Texas trade. The Chicago Burlington and Kansas City R. R. is now making preparations to extend its route to the same line. The Oklahoma "boomers" and similar adventurers, steady-going, home-seeking prospectors, the Knights of Labor and several other industrial organizations, foreign and domestic cattle kings and syndicates, as well as lobbies from all the waiting railroads, are urging Congress to throw the Territory open to settlement, reserving only a small part for the Indians. It is highly probable that the pressure will be effective. What a scramble there will then be for choice locations! How the weak but obstinate settlers will be trampled in the dust or mud by the rushing herds of the cattle kings, or ground to powder beneath the whirling wheels of the railroad monopolists! The reckless land-grabbers having appropriated all the best locations, the *bona-fide* settler will have either to seek a home on less valuable land, or buy one from the lusty land-grabbers. The past is the prophet of the future.

CHEAP POSTAGE IN DANGER.

A BILL has been quietly introduced into the Senate of the United States by Senator Wilson of Iowa, doubtless at the instigation, as it is in the interests, of the express companies. Its object is to double the rate of postage to be charged on fourth-class matter, which includes seeds, bulbs, cions, cuttings, plants, etc. Some years ago, such things were charged one cent for two ounces; but later, through the direct lobbying influence of the express companies, this was changed to one cent per ounce, and now an attempt is being made to increase it to two cents per ounce—the same as first-class or letter rates.

No doubt the express companies secretly desire to see the mails closed to all such matter, and they are cautiously working with that end in view. What care they for the convenience or necessities of the people, so long as they can secure such legislation as shall put 25 or 50 cents into their coffers for the carrying of every packet, however small? What care they if the lone pioneer or homesteader be deprived of the facilities for securing a few garden or flower seeds, to give his family a treat of fresh vegetables or to beautify his home, as long as they can secure a firmer hold on the public's necessities? Wherever there is competition, the companies' charges are usually moderate, but in the absence of competition, they practice bare-faced extortion, and it is the lonely pioneer, the isolated settler and the farmer far away from large towns that suffer most from their rapacity. Deprive these of cheap mail facilities, and they are at once placed at the mercy of greedy corporations that know no mercy. Our sister country, Canada, still carries this class of mail matter at the old rate of one cent for two ounces, and does not find it burdensome to her mails, and why should not we go back to the old standard? We certainly are strenuously opposed to any increase of the present rate. Express companies are a great convenience and are all right in their places; but we are utterly opposed to cutting off so great a public necessity as cheap postage on this class of goods, or of doubling the rates charged for its enjoyment, merely to enrich them or enable them to pay large dividends on their greatly watered stock. We are moving in the right direction in cheapening letter and newspaper postage; do not let us go backward in this other direction.

We hope that every Grange, Farmers' Alliance and other organization will see to it that their Members of Congress be warned that such a measure would be unpopular, and urge them to a firm stand against so foolish a change. The farmers of Iowa should also bear in mind that in this matter Senator Wilson has become the tool of the express companies, working against the agricultural interests of the country; how can they trust him in other matters in which the interests of the public clash with those of wealthy corporations? Corporations soon learn what legislators can be "influenced" in their behalf, and the law-maker who acts for one, is hardly likely to refuse to act for another for a like consideration. Cheap postage has helped to make our people happy and prosperous, and cheap postage in all classes we must maintain.

NOTICE TO SUBSCRIBERS.

IT is our duty as well as our pleasure to inform our subscribers, who are kindly interesting themselves in increasing the RURAL'S circulation, that the list of $3,300 worth of presents is being almost entirely set aside in favor of our regular premium-list, which offers certain articles for specified numbers of subscribers. The reason, in so far as we can find one, is that all seem to take for granted that *others will be entitled to them.* The fact at this time is simply that we offer twice as many presents in this gift list as there are competitors for them, and that even the most valuable will be awarded for merely nominal clubs.

BREVITIES.

MONEY sent in letters for subscriptions to the RURAL NEW-YORKER is at the sender's risk. Our terms are invariably $2.00 a year in advance.

FROM all we have been able to learn during the past few weeks, the Spanish Chestnut is not hardy in this climate. But the Japan Chestnut is about as hardy as the American.

AN acquaintance, "just for fun," sent 20 cents to an advertiser in one of our city dailies, to learn how to make $35 a week at home on a capital of $1, and received a printed slip with the advice: "Fish for fools as I do."

OFFICIAL statistics show that the eggs laid in the United States during the year are worth twice as much as all the silver produced in the same period. Why all this talk, in Congress, press, and pot-house about silver legislation, while eggs and egg-producers are neglected?

WHAT a high breeding standard for milch cows is that of the Rev. L. B. Loomis, as set forth in his address before the Iowa dairymen! One might imagine that such intelligent cattle would be found pasturing "in the green fields of Eden," to which the Rev. gentleman invites his flock every Sunday, were it not that there frogs could not be in the drinking water, tallow in the feed, or dirty milkers at the pail.

THE State Horticultural Society of Indiana recently decided to establish 11 horticultural experiment stations in different parts of the State. The central or controlling station will be located at Perdue University, in charge of our friend, Prof. James Troop. The Indiana horticulturists show a commendable enterprise in this work. It would be impossible to select any single place where experiments would give equal satisfaction to dwellers in all parts of the great State. By scattering the stations about, far more accurate reports can be obtained.

WHAT is to become of the bill appropriating $500,000 for the extension of the benefits of the Weather Bureau to farmers by means of signals displayed at the various telegraph stations? It was favorably reported to the House by the Committee on Agriculture last Wednesday; but no action was taken on it. Has the Committee done its whole duty in merely reporting the bill; or is it not bound to push it until it passes the House, and then to get the Committee on Agriculture of the Senate to continue to push it in that body? Let us have a little earnestness and honesty in those in charge of legislation affecting agriculture.

LAST week snow fell heavily nearly all over the country. This week mild weather has been almost universal. In the Lower Missouri, Mississippi and Ohio Valleys the temperature has ranged from 10 to 20 degrees above freezing point, and there has been a steady northerly flow of warm, moist air from the Gulf. Are floods likely to devastate the Western river bottoms? Snow and ice have been melting rapidly, while heavy rains, due to the condensation of the atmospheric moisture from the South, add to the flood?

The Poultry Yard.

BEAUTIFUL BIRDS.

WE show, at Fig. 87, two beautiful White Leghorns from the flock of Messrs. Knapp Bros., Fabius, N. Y. These birds have won numberless prizes at poultry shows in this country. It appears to be generally admitted that the White Leghorns have never been excelled as egg producers. The pullets mature early, and it is often next to impossible to get them to sit. With proper care and treatment, they are fine winter layers. The eggs, in this market at least, command an extra price. The fowls consume less food than the larger breeds, and are good foragers, and when well bred, exceedingly beautiful. In every breed of cattle, sheep, horses or poultry there are good and bad strains. This fact frequently explains why it is that some people are much pleased with a certain breed of poultry in which others find nothing but disappointment. The strain to which these birds belong is an excellent one. They are larger than the average Leghorns, are remarkable for their pure white plumage, yellow legs and beak, white ear-lobes, without being white in the face, good forms and medium-sized combs. As an evidence of the laying quality of this flock, Mr. Knapp states that in one year 200 hens averaged 13 dozen eggs. A fine display of eggs from this flock was made at the late poultry show in this city. They were beautiful in shape and color, and attracted much attention.

POULTRY NOTES.
